2. Without balanced hearing, it is difficult, if not impossible, to determine the direction from which a sound is coming. This sound localization is thought to take place in the brainstem and requires a balanced input from each ear. Localization is very important for normal functioning in our daily life.
3. Hearing from only one ear will make it very difficult to understand speech in the presence of background noise. This is often referred to as the cocktail party effect. Being unable to hear speech in the presence of background noise is one of the most common complaints of hearing impaired individuals. Often, more problems are created than solved when there is bilateral sensorineural hearing loss and a hearing aid is used in only one ear.

Prescribing only one hearing aid for a binaural hearing loss has detrimental perceptual effects, as well as deleterious physiological effects in the unaided ear. It is important to explain these clinical issues to the patient. Patients need help in overcoming the psychological aversion to the idea of wearing a *set* of hearing aids.

There are two situations in which aiding only one ear is appropriate; when there is a hearing loss in one ear and when the hearing loss in one ear is so severe that the best correction achievable still will not balance the hearing with the other ear.

Even when amplification is determined to be appropriate, a fourth question to address is: Is the patient motivated to hear better? Often the process of adjusting to hearing aids is difficult, even for the well-motivated patient. If a patient is using hearing aids because of pressure from the spouse, a family member, or a friend, the chance of success is lessened. Often a patient needs time to confront the negative attitudes he or she may have about hearing aids. Caregivers can offer assistance in this acceptance process.

Once the patient accepts treatment by amplification, the final question for the physician is: What professional care should be rendered to ensure successful hearing aid use? Professional prescription and follow-up care have the greatest impact on the likelihood of successful hearing aid use. The majority of hearing aid manufacturers produce a similar product. Their return

policies, warranties, and repair policies are competitive. Of more critical importance is a cooperative working relationship between health care provider and patient.

Physicians often use other specialists in the treatment of patients. An audiologist should be the specialist to whom patients with hearing loss are referred. It is not the job of the audiologist to sell hearing aids. The audiologist will take a history and perform a physical examination of the ear. He or she will then evaluate the patient's hearing. This initial step in the diagnostic examination is done solely for the purpose of identifying the extent and nature of the hearing loss. Then, and only then, can the audiologist make a recommendation as to what form of treatment, if any, is appropriate.

This information will help guide the physician toward appropriate medical or surgical intervention. If medical or surgical intervention is not indicated, then a discussion of the patient's hearing aid candidacy is appropriate. At this point, the audiologist should provide the patient and referring physician with the options for therapy.

The audiologist needs to determine which ears are treatable, if there is a tolerance problem for loudness that would limit the output of the hearing aids, which frequencies need amplification, and how much amplification is needed at each frequency.

Once these questions are answered, and if the patient decides to pursue the use of amplification, then the audiologist may prescribe a set of instruments that can provide the patient with the maximum benefit attainable with the current technology. The audiologist should tailor a rehabilitation program for the patient including regular follow-up visits. These follow-up visits are the mainstay in the identification of problems with current and additional hearing loss, as well as electronic distortion in the hearing aids.

When all of these issues are addressed, and the hearing impaired patient has been referred for care to the appropriate hearing health care provider, the patient is likely to be in the best possible position to be a successful hearing aid wearer. Through the team efforts of the physician, the patient, and the audiologist, the patient will experience a great deal of comfort, freedom from impaired communication, and an enhanced quality of life.

# Amos A. Evans MD: Father of American Naval Medicine

Seruch T. Kimble MD, FACP

*Dr. Kimble is an internist in Silver Spring, MD.*

---

*Dr. Evans was the first to be appointed Surgeon of the Fleet, after having served with distinction on the frigate USS Constitution (Old Ironsides) during the War of 1812.*

---

Amos Alexander Evans MD, a Marylander and surgeon on "Old Ironsides," has been called the Father of the Naval Medical Corps.<sup>1</sup> He was the first to be appointed Surgeon of the Fleet, after having served with distinction on the frigate USS Constitution during the War of 1812. His medical and surgical skill, devotion to duty, and meticulous recordkeeping set the standard for those who followed.

Amos was born four miles north of Elkton in Cecil County, Maryland, on November 26, 1785. His father, John Evans, owned a foundry which manufactured bar iron, nails, hinges, and other articles. His father also rolled copper, and he and Paul Revere provided most of the sheathing and other copper items for the early American navy. The Evans homestead still stands on the banks of the Big Elk Creek and has been beautifully preserved (Figure 1).

Young Amos received his early education at the Newark Academy in Delaware. He studied medicine from 1804 to 1806 under Dr. George E. Mitchell, a general practitioner in Elkton. In 1806 and 1807, Evans attended lectures by Dr. Benjamin Rush and Dr. Physick in Philadelphia. Three volumes of his notes on lectures by Dr. Rush are in the possession of the USS Constitution Museum in the Charlestown Navy Yard, Boston, MA. The Museum also has single volumes of his classroom notes on courses given by Dr. Physick of Philadelphia and Dr. Jackson of Boston.

Benjamin Rush MD, a signer of the Declaration of Independence, was the most influential physician of his day. Several factors accounted for this, among them is the fact that 400 of the 600 medical students in our young country at the time were trained in Philadelphia. Rush was a teacher, clinician, author, and politician. He had strong likes and dislikes. Chief among the latter were disease, the British, and Dr. Shippen. His therapeutics were in the British tradition. It was thought that illness was caused by toxins which could be removed by bleeding, purging, vomiting, or blistering. By today's enlightened standards, such therapeutic measures for disease and trauma are illogical and harmful. However, such was the dogma of the days of Benjamin Rush MD and his students. This is clearly reflected in the personal journal and the two prescription books kept by Dr. Amos A. Evans while he was on the USS Constitution.

Figure 1. Evans homestead on the banks of Elk Creek, north of Elkton, MD

A reprint of the journal is preserved in the rare book section of the Library of Congress in Washington DC. The prescription book covering March 26, 1812 through August 27, 1812 is in the possession of the Clements Library of the University of Michigan at Ann Arbor,<sup>2</sup> as is Evans' "Reefer's Log" and the medical records he kept while stationed at the Charlestown Navy Yard in Massachusetts. The prescription book from his August 28, 1812 through March 5, 1813 period on the USS Constitution is at the Historical Library, Yale University School of Medicine, New Haven, CT.<sup>3</sup> Several letters which he wrote to his parents during extensive travels have been preserved. They reveal a well-educated, patriotic young physician with a multitude of interests. He recorded his professional and social observations in meticulous detail.

His Navy career started in September 1808 when he was appointed surgeon's mate USN. In 1810, he became surgeon, and during 1812 to 1813 served on the USS Constitution. In 1814, while on shore duty, Evans studied at Harvard University and received his medical degree with distinction. The following year, he was assigned to the USS Independence. Commodore Bainbridge appointed the young Dr. Evans, now age 29, Surgeon of the Fleet; he was the first to hold that rank in our young Navy's history. In July 1815, the USS Independence sailed to the Mediterranean on orders of President Madison to quell the Barbary pirates. The journal kept during this tour of duty is in the manuscript division of the New York Public Library.

In 1817, Amos Evans MD returned to Elkton, MD and engaged in private general practice. It would have been difficult to raise a family on fifty dollars a month, the prevailing wage for a naval surgeon. Resignation from the Navy came in 1824.

His first naval assignment was to the Marine Hospital in New Orleans, Louisiana. The Clements Library of the University of Michigan has two letters he wrote to his parents from New Orleans in 1809. His letter of

February 13, 1809 described the city, the hospital, and the large variety of commercial shipping on the Mississippi. After analyzing the shortcomings of the carts and wagons of the city, and the malnourished state of the beasts that pulled them, Evans speculated upon the rumored impending attack by the Spanish. He considered several battle scenarios. In a letter dated June 15, 1809, he fluently expressed his patriotic fervor and anti-British bias:

I confess I am somewhat of Duane's opinion relative to the settlement of our differences with Great Britain. Nor do I believe that the adjustment is honourable to us. We have abandoned the main question and tacitly acknowledged the right of search and impressment. Have they given up the right of search? No. Have they punished Barclay? No. What ever they may say to the contrary, he was absolutely promoted to a higher command! Have they returned the seamen taken from the Chesapeake? No. That is impossible for some of them were hung. Have they in short given us anything else other than a few vague promises? No, no. 'Tis all talk and no cider...

Dr. Evans was ordered to St. Mary's, Georgia in 1812. While en route, he was shipwrecked along the North Carolina coast. He travelled by land to Washington DC. The Navy Department assigned him to the frigate USS Constitution which was lying in the Potomac. Maintenance and repairs were being performed, as well as the resheathing of her bottom with copper. His prescription book started March 26, 1812.

### The USS Constitution

Many of us gave our pennies to save her when we were in grade school. The campaign was successful, thanks to the monetary contributions, the skill of the engineers and artisans who did the work, and the live oak timbers which held her together when the rotted parts were replaced. She floats proudly in the Charlestown Navy Yard (Figure 2). A total of 700,000 tourists visit her each year. They see the sick bay (Figure 3), the surgeon's quarters (Figure 4), and the room in which amputations were performed. The latter had its floor painted red so the blood would not alarm the crew. After the guided tour, visitors have a heightened awareness of the hardships of early naval life and the valor of its men. The nearby USS Constitution Museum contains many artifacts and displays. Guests are shown a slide presentation based on Dr. Evans' activities aboard the vessel, focusing on the battle with the Java. Visitors are also shown shipbuilding techniques of the period, and portraits and biographical sketches of many of the commanding officers. Unfortunately, no portrait of Dr. Evans is extant.

The US Navy, such as it was, was disbanded in 1785 and the individual state's navies sold off.<sup>4</sup> Our merchantmen were plundered and their crews seized by both England and France, so George Washington signed a bill in 1794 to create a permanent navy. Work was immediately started on six frigates, including the Constitution, the Constellation, and the United States. All three were launched in 1797 in Boston, Baltimore, and Philadelphia, respectively. They were used in the

Figure 2. USS Constitution, Charlestown Navy Yard, Boston, MA.

Figure 3. Sick bay showing officers beds. In the event of death, the bed was weighted with cannon balls, a lid affixed, and the flag-draped coffin committed to the deep. Non-officers were buried in their hammocks.

war with France (1798) and the Barbary wars (1803 to 1806). By 1812, the Navy had seven large frigates, and nine schooners and brigs. Their crews were experienced and skilled. The USS Constitution is a three-masted fifty-six-gun frigate which carried a crew of 456 men. She carried one surgeon, one or two surgeon's mates, and a loblolly boy. The loblolly boy was a petty officer whose chores included shaving, feeding, and bathing the ill and injured. He compounded the

Figure 4. Surgeon's quarters. Berth railing in foreground.

prescriptions and rang the ship's bell to announce sick call. He wore no specific uniform. In some instances, he kept the journal (prescription book), but comparison of the prescription books with Dr. Evans' personal letters indicates that Evans did the overwhelming majority of the writing. The surgeon had to function as psychiatrist, urologist, ophthalmologist, internist, dermatologist, orthopedist, and general surgeon. His tools were his eyes, ears, nose, and fingertips. The stethoscope, thermometer, and sphygmomanometer had not yet been invented. Bacteria and viruses were unknown. Treatment was symptomatic.

### Medical Problems

Dr. Evans' case load was heavily weighted with venereal disease, injuries, and dysentery. Functional disorders, scurvy, arthritides, ear, nose and throat (ENT) infections, seizures, and drunkenness were also encountered.

Syphilis was treated with mercuric chloride ointment rubbed on the thighs twice a day. Cataplasms (poultices) were applied to buboes. Bread, lead acetate, and subacetate poultices were applied to chancres. None of this was curative of course, and sailors played a large role in spreading syphilis throughout the world.

Gonorrhea afflicted about five percent of the Constitution's crew. Evans applied lead acetate solution, suspended the testicles, and administered sodium sulfate and flaxseed tea as laxatives. He used the term "chordee" to describe painful penile erection, often with a downward bowing, caused by gonorrhea. The term is derived from the French expression, *chaude pisse cordee*.

Diarrhea was treated in a standardized fashion and the stools were not described. Ipecac, Dover's pills (ipecac and opium), rice, tapioca, flaxseed tea injections, and sago palm pudding were frequent remedies. Injuries occurred often, even in the absence of hostilities. Sailors fell from the rigging. They were occasionally injured while being punished. Severe cases were sent to a hospital when the ship was in port. An illustrative case is that of Prescott.<sup>5</sup>

*Prescott.* May 30. Cut his head some days ago by diving against something in the bottom of the river (Potomac). On examination by dilating the wound I find that the pericranium has been laid bare and that some small spicules of bone had exfoliated and were in the wound keeping up a thin discharge. Extracted them and introduced bits of lint into the wound to keep it open. Cont. dressing with Laudanum. No fracture or depression of any kind could be discovered, nor any symptoms whatever of either concussion or compression.

May 31. Discharge from wound is thick and healthy. Apply pledget of lint to absorb the pus.

June 1. Wound in scalp looks well. No pain or fever.

June 2. Head looks better.

June 3. Head better

June 4. Tongue slightly furred. Not much appetite. Rx Sulph. soda oz i. Dress head as usual. No pain.

June 5. Head better. Dress as before.

June 6. Continue dressing.

June 7. Returns to duty.

Another fascinating case is that of a sailor with the prophetic name of Fails.

*Fails.* April 29. Had been out of the yard some days drinking. Was called to him yesterday morning and told that he had taken opium. Found him lethargic and stupid. Could not rouse him by any exertion. Pulse was rather increased. Tried to produce vomiting with a feather but did not succeed. Gave him granatum about 15 gra. Ant. Tart. Potass. before a discharge was produced. His stomach was well cleansed but the stupefaction remained until near night. His skin became cold and pulse much weak. Gave him wine and water. Found his tongue furred and dry in the evening. Gave Laud. Vin: ant. spt. n Dulc. Continue wine and water. At 10 o'clock complaining of pain in his stomach. Hicough. Pulse feeble. Applied Emplastrum Epispart. (vesicant) to region of stomach which did not remain on a sufficient time to draw. Produced a discharge from the bowels by an injection. His tongue is furred and dark this morning. Pulse quick. Skin cool. His stomach will retain nothing. Apply Emplastrum Epispart. to region of stomach.

April 30. Continued to vomit through the day. Pulse more tense and face flushed. Took some blood. Gave saline effervescent draughts am hora. Gave enem. Face flush this morning. Tongue very foul and yellow. Pulse quick and somewhat tense. Blister drew well. Vomited this morning. Had a stool this morning. Complains of weakness and uneasy sensation at stomach. Was somewhat delirious yesterday. V.S. enema; saline draughts.

May 1. Continued to vomit through the forenoon. Gave Laud. liq. gtt. x in his effervescing draught. Gave essence peppermint in each dose in the evening. Took about oz vi of blood at noon. Bowels open. Had some rest last night. Was now and then delirious. Much better this morning. Tongue not so foul. Drank some coffee and thin sago. Pulse still quick. Some soreness about stomach. Cont. mixt. effervescent am 3 hora. Sago, etc.

May 2. Rested well last night. Took Super. Tart. Potass. yesterday. Bowels open. Pulse quick. Tongue slightly furred. No pain. Some appetite. Sago. Tapioca or rice. A little wine.

May 3. Took some bark and wine yesterday evening. No stool since yesterday. Pulse quick. Some appetite. No pain. Rx Dect. cinch. Wine. Had cramp in stomach he says last night. Rx Essence peppermint occasionally. Injection. Nourishing and light diet.

May 4. Much better. Cont. Dect. cinch. Wine. Nourishing diet.

May 5. Better. Cont. Dect. cinch cum elixir vit. Wine.

May 6. Much better. Cont. Dect. cinch. Wine.

May 7. Better. Cont. as before.

May 8. Returned to duty.

May 19. Has been out for some days. Came back yesterday

evening quite delirious. Pulse quick and weak. Tongue furred. Complains of being weak and vertigo. Says he has eaten nothing and has lain out in the rain. Rx effervescing draught eum Laud. Liquid gtt. x in each dose am 2 hora. Vomits frequently. Wine.

May 20. Much better. Quite rational. Wine. Dect. cinch.

July 10. Has had dysenteric affection for some days. Says he voids blood. Tongue furred and streaked with yellow. Pulse frequent and feeble. Rx Pulv. ipecac gr. xv L.D.

July 11. Med. operated yesterday. Had a griping and took Pulv. Doviri gr x (ipecac and opium). Was attacked this morning with a distressing vomiting. Pulse quick and feeble. Rx effervescing mixture am hora eum Laudanum Liquid gtt. x and effervescing peppermint gtt. x in each dose. Toasted water for common drink.

July 12. Was intoxicated yesterday and has been vomiting all night. Gave enema of flaxseed tea with Laud. Rept. mist. effervesc. every 2nd hour. Dress blister.

July 13. Pulse very feeble. Tongue furred; dark. Lax troublesome. Vomiting checked. Rx pill ex opii and ipecac and col. tir die. Wine.

July 14. Fell out of his hammock yesterday and cut his eyebrow. Retained the edges with adhesive plaster. His pulse was feeble. Gave wine and pills as directed yesterday.

July 15. Pulse very feeble. Great debility. Rx pills ex opii et ipecac and submur. no. iii. Wine.

July 16. Pulse feeble and frequent. Bowels very loose. Skin feverish. Feels much debilitated and is impressed with a belief that he will not recover. Rx opii gr ss, Submur. gr ss. Ipecac gr. i. Sum in am tertia hora. Drink wine and water. Arrow root.

July 19. Is extremely feeble. Scarcely any pulse. Low muttering delirium. Ordered pill ext. camph gr i cal and opii gr ss am hora. Madeira wine every 20 min.

July 20. Cont'd to sink gradually until the afternoon when he expired about 5 o'clock.

## Battle Action

The Constitution put to sea just after the war with England had been declared. Dr. Evans' first notation in his personal journal reads, "June 11th, 1812 - left the Navy Yard at Washington City in the US frigate Constitution."<sup>6</sup> A few days later, she was becalmed off the New Jersey coast while confronted by three British frigates and two smaller ships. The chase lasted three days and escape was effected by the ship's cutter hauling the kedge anchors ahead and then having the crew man the capstan to haul the ship ahead. Evans wrote in his journal:

July 19 - thus terminated a disagreeable chase of nearly 3 days, - attended with inexpressible anxiety and alternate elevation and depression of spirits as the winds were propitious or otherwise. We had many times given over all expectations of making our escape, and had it not been for uncommon exertion we must inevitably have fallen a prey to the superiority of our enemy.

On August 14, while at sea again, one of the surgeon's mates left a candle burning in his stateroom. A fire ensued and Dr. Evans injured his right hand with a crowbar while forcing open the locked stateroom door. The fire was extinguished. He was obliged to write with his left hand and was afraid that he might develop tetanus. He added, "The cry of 'fire' is dreadful on shore, but ten thousand times more distressing on board a powder ship at sea."

On August 19, 1812, the Constitution battled the Guerriere. Evans described the action as follows:

August 19th, Wednesday. - Cloudy and foggy. Course S. & W. Wind N. by E. Lat. observed 41° 42' N. Long. by D. R. 55° W. At 2 p.m. discovered a large sail to leeward. Made sail and stood down for her. At 4 discovered her to be a large Frigate. When we were within about 2 or 2 1/2 miles she hoisted English colours and fired a gun. We stood towards her with reefed topsails without showing our colours. She then commenced firing, and gave us several broadsides without much effect before we commenced firing. She kept wearing several times with a view probably of trying to get the weather gauge of us, which we avoided by wearing also. We hoisted our colours and fired the first gun about 15 minutes past 5 o'clock p.m., but did not come into close action until about 6 o'clock, and after 25 minutes from the time we were closely engaged she struck, having previously lost all three of her masts and bowsprit. Her hull was much injured. Several of her guns were dismounted or otherwise rendered useless on the gun deck by our shot. She had 15 men killed and 62 wounded, most of them very dangerously, immense mischief and destruction having been done by our grape & canister shot.

**Killed:** Wm S. Bush, 1st Lt. Marines; and Seamen, Jacob Sago, John Brown, Caleb Smith, James Ashford, Robert Brice, James Reed.

**Wounded:** Charles Morris, 1st Lieutenant, Dangerously; J.C. Aylwin, Master, slightly; Richd Dunn, Seaman, Dangerously; Danl Lewis, do.do; Taylor, do. Slightly; Mullen, Marine, do.; Geo. Reynolds, Seaman, do. Beside 4 or 5 others so slightly as not to be disabled from coming to Quarters.

During the engagement she came against our stern with her bows twice, and carried away her jib boom and injured our Taffrail. It was when in that situation that Lt. Morris and Lt. Bush were shot. Mr. Morris first jumped on the Taffrail with an intention of boarding her and was instantly wounded in the parietes of the abdomen. Mr. Bush jumped into his place the instant he fell and immediately one musket shot entered his face and passed into his brain. Little or no other injury was done us at that time, and her quarter deck and fore-castle were completely swept. Her Second Lieutenant was killed, and the Captain, 1st Lieutenant, Sailing master, and one of the Master's mates wounded. She hoisted 3 or 4 flags at the commencement of the action, and struck immediately after she got clear of our stern. Her foremast and mainmast and mizzenmast fell about the time she was in contact with us. After she struck the Capt. Is. Rd Dacres Esq came on board and informed us that it was His Britannick Majesty's ship La Guerriere. We sent Lt. Reed on board and finding the ship in a situation that was considered dangerous to attempt getting in we were employed all night getting the men and crew from on board. She mounted 49 guns and had about from 260 to 300 men having sent previously part of her crew in prizes. Capt. Dacres is a pleasant, agreeable young man, 24 years of age. Our crew behaved very nobly. They fought like heroes, and gave three cheers when the colours were hoisted. They also cheered when each of her masts went over the side, and when her colours were struck. Whilst she was on our stern one of her forward guns was run nearly into our cabin window and fired, but did (fortunately) little or no execution. A shot that entered our after port on the starboard side of the gun deck killed 2 men at the after gun and wounded one. From the firing of the first gun to the close of the action was one hour and ten minutes. The Guerriere had 15 killed and 62 wounded.

During the battle she earned her nickname -- Old Ironsides. One of her gunners saw a British shot bounce off her oak planking and shouted, "Her sides are made of iron." Dr. Evans described the wounds of the seven injured seamen in great detail. He wrote daily progress notes and documented the results of therapy. He performed one leg amputation. In those days, stumps invariably became infected, despite cauteriza-

tion with tar. All seven patients recovered. Evans was a fine anatomist and performed autopsies when possible to confirm his diagnostic impressions. He also, on occasion, dissected amputated limbs to ascertain precisely the nature of the injury.

On September 15, 1812, Captain Hull resigned his command to Captain Bainbridge. In October, they took to sea from Boston and headed to South America.

Off the coast of Brazil, the Constitution met the Java on December 29, 1812. The action was brief. The British had forty-eight killed and 102 wounded. We lost nine, with twenty-two wounded. Seven of the wounded eventually died, including three of the four with leg fractures. Presumably, all of these had amputations. Evans vividly described the action as follows:<sup>7</sup>

December 29, Tuesday. - At 8 a.m. discovered two ships to windward of us. At 9 one of them stood along shore, the other towards us. At 10-30 min. within 8 or 9 miles coming up with us. At 11:30 the Comm'd. supposed the strange sail to be a two decker and made sail away from her; made the private signal of the day which was not answered. The strange sail hoisted a tricoloured signal flag at her main topgallantmast head & kept it flying a long time. At 12 the sail gaining on us going 10 k. Lat. ob: 13° 6'S. Long. by chron. 37° 38'W. Hoisted our ensign & pendant. The strange ship then hoisted an English ensign at the peak. At 1:25 the strange sail gaining on us discovered her to be a Frigate. At 1:37 took in part of the sail and stood for the enemy, having previously had all clear for action. At 1:45 she bore down intending to rake us which we avoided by wearing. At 4 minutes before 2 p.m. we fired a broadside at her, when she bore up and returned it: she was at that time distant about 1 mile. She was standing bows on but had hauled down her peak with an intention of wearing, when an order was given to the 3rd Division to fire one gun in order to make her hoist her colours - but the whole broadside was fired without stopping. The action then commenced warmly on both sides. At 3:15 her maintopmast and foremast went over the side. At 4 her mizzenmast went about 10 or 15 feet from the deck. At this time her fire was stopped and we hauled aboard our fore and main tack and stood from her to repair our braces, etc. At 4:25 her mainmast went nearly by the board. The colours still flying at the stump of the mizzen mast. At 4:50 wore and stood for the Enemy. At 5:25 got ahead of her in a raking position and were about giving the order to fire when she struck her colours, at which our crew gave 3 hearty cheers, as they had done when we first beat to quarters & several times during the action. At 6 sent the cutter with Lieut. Parker on board, which returned with the 1st Lieut. Chadds (the Capt. being mortally wounded) who delivered his sword, together with His Majesty's Ship Java - rated 38 but mounting 47 guns - Henry Lambert Esq. Capt. employed during the night in taking the officers & crew from the Ship. She had about \_\_\_ killed & \_\_\_ wounded. The exact number could not be ascertained. Their own account was killed and 105 wounded. She had on board supernumeraries and all were about 450. She was six weeks from England bound to Bombay. On board were Lt. General Hyslop & suite, consisting of Major Walker, & Capt. Wood; a Surgeon's Mate, Lt. of Marines, and 2 Sea-Lts. passengers, together with Capt. Marshall, a master and commander, who all were actively employed during the action.

Dr. Evans emphasized sanitary measures aboard the ship. He asked the Captain for stricter hygienic standards for the crew, adequate supplies of food including citrus, and ample bedding and clothing which should be boiled periodically. He requested two washing days per week instead of one. His concern over small pox is

reflected in the following letter dated April 16, 1816 to Ben Thomas of the Navy Department:

Sir: The appearance of the small pox on board of the Macedonia, a few days ago, brought to my recollection a plan which I have often thought of suggesting to the Navy Department viz the propriety of issuing a circular directing the surgeons who attend recruiting rendezvous to examine strictly whether the recruit has ever had the small pox or kine pox, and if he has not had either, directing him to vaccinate on the spot.

I am convinced that, besides keeping the small pox altogether from the Navy, it would tend to prevent the extension of that dreadful malady in our country. It has generally been conveyed from one point to another by means of vessels. The disease has been very rife and mortal in New York and Phila the past winter, but, there has not been a case of it in this town until one of the men shipped in New York for the Macedonia brought it a few days ago.

The horror associated with the appearance of this disease at sea amongst a crew many of whom have never had it, can be described by the officers of the Guerriere and Congress, both of which vessels were visited by it on their return from the Mediterranean.

If Congress would pass a law prohibiting the employment of any seaman in a merchant vessel, who could not produce satisfactory proof of having had either the small or kine pox, and requiring similar proof before a passenger could be admitted into ports, the disease might be eradicated from the country. The expense would be no obstacle because there are persons in any port who vaccinate the poor gratis: and sailors are such thoughtless and improvident animals as to require some such compulsory stimulus. This practice would have another advantage: it would prevent the loss of many of this valuable class of citizens in foreign ports, by this disease; and consequently, the hazard of much valuable property by having the vessel weakly manned.

An order of this kind would not be attended with any expense to government, since the surgeon would keep a supply of virus not only sufficient for his own use, but would be able to accommodate physicians of the town with it in a fresh and pure state.

I beg you will excuse the liberty I have taken in addressing you, and be sure that in so doing I have been actuated by the best motives. With much respect

A A Evans

Dr. Evans was a Med Chi member and was a censor for Cecil County in 1831 and 1840. He died in Elkton on January 15, 1848, and is buried in the family plot at the Presbyterian church. A small unpretentious tombstone marks his grave (Figure 5). His fellow citizens urged him to run for the Maryland governorship on several occasions. He could have achieved fame and fortune, but preferred to minister to the sick in his small town, riding his faithful roan on housecalls. He left two sons and a daughter. One son, General Andrew Wallace Evans, was a West Point graduate who served in the Union Army. The other son, Alexander Evans, was a lawyer who served three terms in Congress.

### Summary

Amos Evans MD exemplified the best in American medicine in the early 1800s. His initial medical training was an apprenticeship with a country doctor. Later he supplemented his knowledge with formal training

**Figure 5.** Grave of Amos Alexander Evans MD, Presbyterian Church Cemetery, Elkton, MD. He was the author's great-great grandmother's brother.

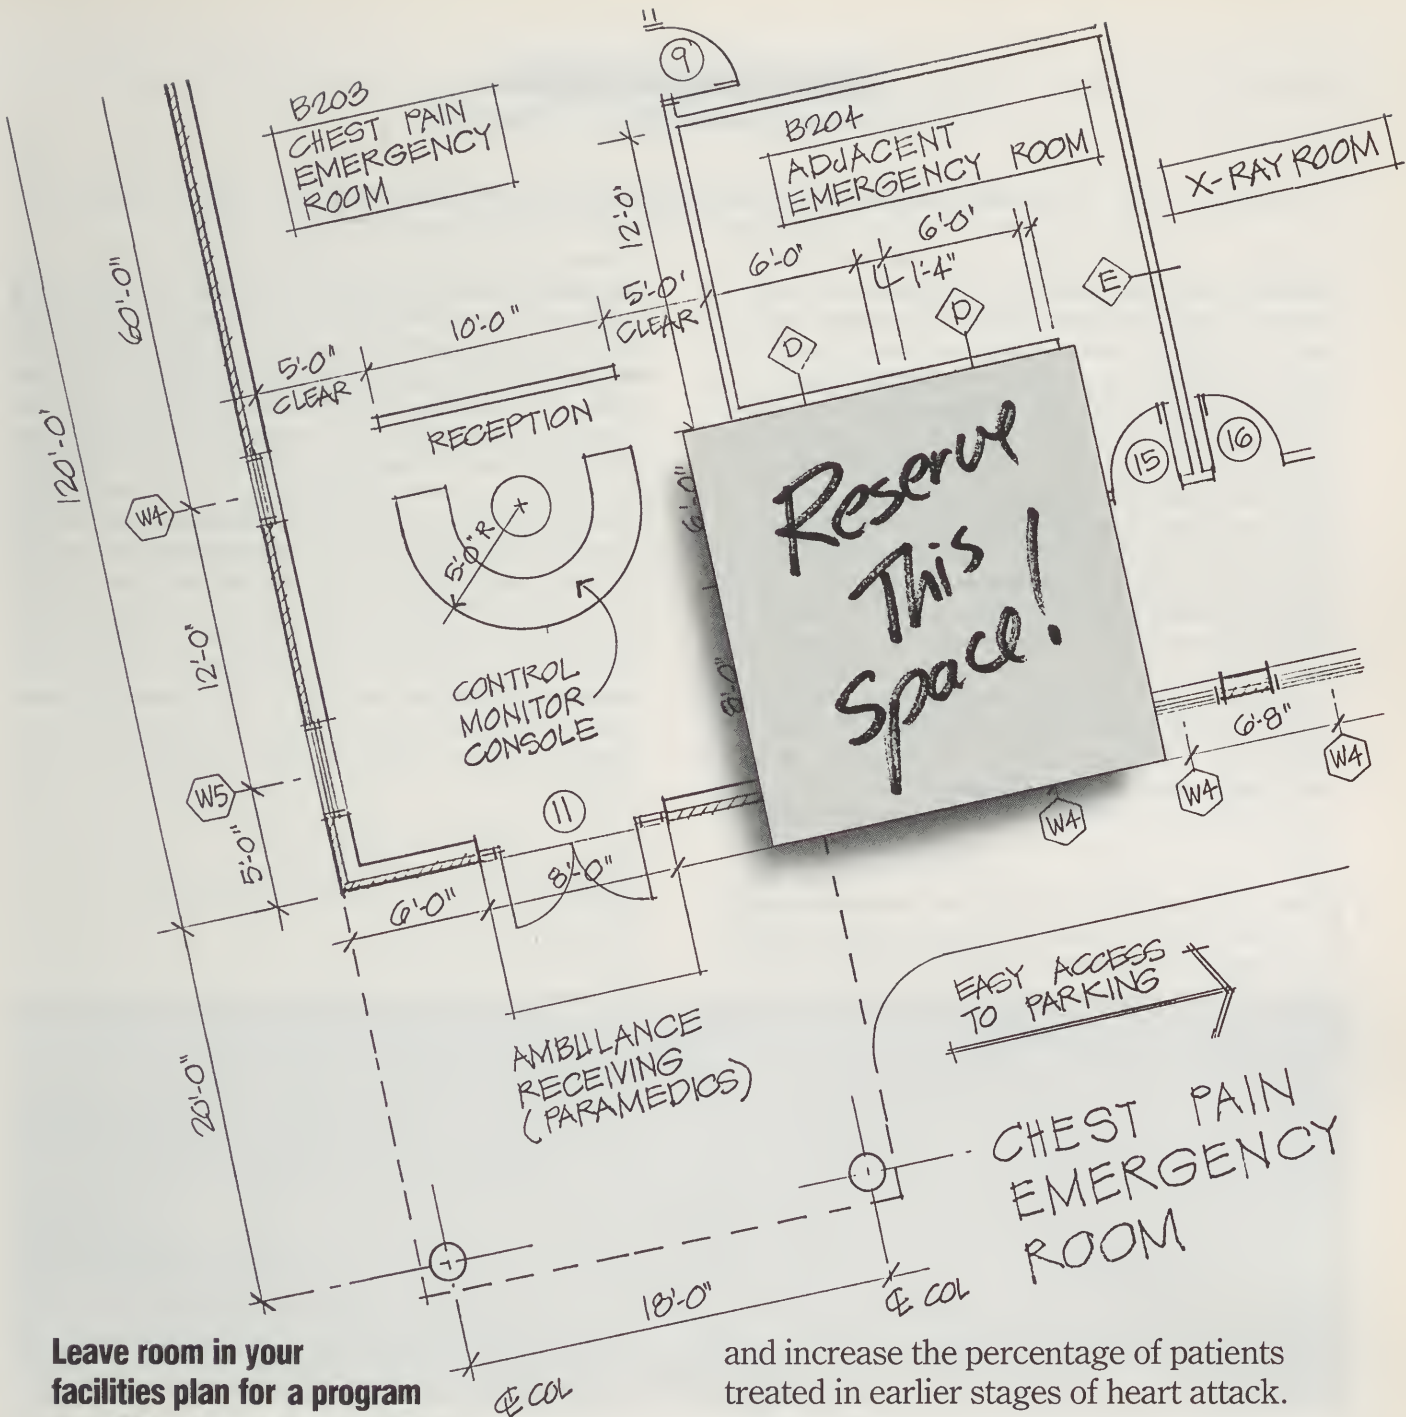

under Drs. Rush and Physick in Philadelphia. His records indicate that he used contemporary therapies (amputations, bleeding, purging, blistering, and medications) judiciously and usually effectively. His compassion, keen intellect, and scientific curiosity about a broad range of subjects shine through his writings. Dr. Evans was the surgeon on the USS Constitution during her most glorious moments. He was the right man at the right place at the right time.

His records have been scattered far and wide. Fortunately, their interest and value have been recognized and they have been preserved. His example contributed greatly to the standardization and improvement of naval medical care. His recommendations for medical examination of all recruits and vaccination of all not immune to small pox were adopted. He has fittingly been called the Father of American Naval Medicine. After his move back to Elkton, Maryland, his practice flourished and he was a much-loved community leader. He died on January 14, 1848, at age sixty-three.

**Leave room in your facilities plan for a program that fills beds and saves lives: Early Cardiac Care.**

Designate a center at your hospital where adults can check out early warning symptoms of heart attack. You can get more cardiac patients into your hospital at a time when your medical staff can do the most to help them. An Early Cardiac Care Center, combined with effective cardiac outreach programs to increase awareness of cardiac symptoms, will increase Cardiac Care Unit admissions—

and increase the percentage of patients treated in earlier stages of heart attack.

Get to the heart of the heart attack problem in your community. For more information on how to establish an Early Cardiac Care Center, contact: Raymond D. Bahr, M.D., FACP

### Why Did My Symptoms of Hypoglycemia Change?

*Doctor, I am twenty years old and developed diabetes about six months ago. At first, I was on intermediate acting insulin (NPH). My control was very erratic and regular insulin was added to my twice daily injections of NPH. I began having frequent episodes of hypoglycemia manifested by the usual symptoms of nervousness, rapid heart rate, and sweating. Although these symptoms occurred two or three times a day, they were easily treated by the use of juices; I found them more annoying than frightening. However, I was advised to discontinue the NPH and Regular insulins and begin one injection of Ultralente Insulin before breakfast each day. Now I wake up every morning with a headache and, about half the time, I have a lack of muscle coordination and maybe a little mental confusion. When I test my fasting blood glucose, it is about 40mg/dl. After I take my insulin and have breakfast, the headache and other symptoms disappear. Why do I have these new hypoglycemic symptoms and not those of a few weeks ago?*

The usual symptoms of hypoglycemia produced by a rapid acting insulin are those of a fairly sudden fall in blood glucose levels resulting in epinephrine

release as a counter regulatory mechanism. The symptoms of an epinephrine infusion are nervousness, rapid heart rate, and sweatiness. When the insulin was changed to a long-acting type, the blood glucose fall was slow and passage through the epinephrine release phase was gradual, so it went unnoticed. The next phase of hypoglycemia consists of neurological manifestations -- headache, possible lack of muscle coordination, mental confusion and, if untreated, hypoglycemic coma. Not recognizing the early symptoms of hypoglycemia and having nocturnal or very early morning reactions manifested by neurological symptoms are the greatest risks in the use of the long-acting insulin. Better diabetic control can probably be obtained by returning to NPH and Regular insulin injections, and making dietary changes where necessary to cope with the hypoglycemic episodes. When making insulin adjustments, there should be a wait of two or three days before changing the dose, in order to obtain a better baseline for that dose. Chasing hyperglycemic test results with more insulin produces a rebound phenomenon which is really iatrogenically induced brittle diabetes.

### Recurrent Upper Respiratory Infection, Persistent Paravertebral Thoracolumbar Muscle Spasm, and Fatigue Associated with Chronic Active Epstein-Barr Virus Infection

During the past four years, I have seen numerous patients -- without a history of infectious mononucleosis -- who have had recurrent upper respiratory infection, significant paravertebral thoracolumbar muscle spasm, and chronic fatigue associated with persistently high antibody titers to Epstein-Barr virus (EBV) antigens. The EBV antibody levels, particularly IgG antibodies to viral capsid antigen (VCA-IgG), antibodies to EBV early antigens (EA-Ab), and antibodies to EBV nuclear antigens (EBNA), were significantly higher in patients with this syndrome than in asymptomatic, presumably healthy, individuals. This suggests that these patients were suffering from a syndrome in which a latent EBV infection may have been reactivated. Many patients with this syndrome responded favorably to treatment with ibuprofen, a nonsteroidal anti-inflammatory agent. Three typical cases presented as follows.

#### Case Reports

**Patient 1.** A forty-eight-year-old woman presented with complaints of persistent posterior cervical and perithoracic pain radiating laterally to the anterior chest wall. She had had fatigue for the previous three months and a nagging cough of about four months duration. The preceding year she had had a persistent upper respiratory infection which lasted four to five weeks.

Examination revealed a blotchy erythematous pharynx without significant cervical lymphadenopathy, bilateral serous otitis media, and muscle spasm of the left paravertebral thoracolumbar area which followed the course of the erector spinae muscles.

The EBV antibody titers are shown in the Table. A twenty-six-test biochemical profile revealed no significant abnormal test results. The sedimentation rate was 11 mm; the sputum culture was negative; and the leukocyte count was 4,000/mm<sup>3</sup> with 56 percent lymphocytes. A chest x-ray was within normal limits.

The patient was treated with ibuprofen (600 mg tid) and misoprostol (200 mg tid). The pain in her spine subsided, the fatigue disappeared, and the cough cleared.

**Patient 2.** A fifty-four-year-old woman first presented with complaints of fatigue and persistent upper respiratory symptoms. Examination revealed only mild bronchitis. The EBV antibody titers are shown in the Table. The patient was treated with ibuprofen (800 mg tid) and her symptoms disappeared.

Two months later, the fatigue and persistent upper respiratory symptoms returned. Complaints concerning back pain were difficult to determine because the patient had had prior lumbosacral disc surgery. She was treated with ibuprofen and an antitussive. Her EBV antibody titers at that time and five months later (when she was asymptomatic) are shown in the Table.

About six months later, the patient presented with severe persistent bronchitis, extreme fatigue, and severe back pain. Examination revealed a blotchy pharynx without significant lymphadenopathy, harsh bronchial sounds, and severe spasm of the right posterior thoracolumbar area which followed the path of the erector spinae muscles. She had a white blood count (WBC) of 8,500/mm<sup>3</sup> with 80 percent granulocytes and 20 percent lymphocytes. The EBV antibody titers are shown in the Table. Ibuprofen (600 mg tid), misoprostol (200 mg tid), ciprofloxacin (500 mg bid), and bed rest were prescribed. A chest x-ray was within normal limits. Significant improvement was noted when she was seen one week later.

**Patient 3.** This fifty-two-year-old woman had been previously treated for hiatal hernia, hypertension, glucose intolerance, and fibrocystic breast disease. Her past history included two to three episodes of bronchitis per year and cervical radiculopathy.

About two years ago, she presented with an acute upper respiratory infection and fatigue. Her EBV antibody titers are shown in the Table. She responded slowly to erythromycin and a cough expectorant.

Three months later, she presented with severe right paravertebral thoracolumbar muscle spasm which followed the course of the erector spinae muscles. The EBV antibody titers at this time are shown in the Table. The patient was treated with ibuprofen (800 mg tid) and she responded favorably.

Three months later, she returned with acute bronchitis, unilateral right paravertebral muscle spasm, and fatigue. The pain radiated to the right hip. X-rays of the chest and right hip were negative. X-rays of the lumbosacral spine showed mild degenerative changes. A bone scan was normal. A magnetic resonance image (MRI) of the cervical spine two years earlier had been within normal limits. The EBV antibody levels are shown in the Table. The patient was given fenoprofen calcium.

Eight months later, the patient returned and com-

**Table. EBV Antibody Reciprocal Titers**

	VCA-IgG	EA-Ab	EBNA
<b>Patient 1</b>			
Initial	640	80	80
Two months	2560	80	320
<b>Patient 2</b>			
Initial	640	ND*	40
Two months	640	40	160
Seven months	640	40	40

Ten months	1,280	ND*	80
Fifteen months	5,120	10	80

\*ND = Not done.

plained of a backache. Again, examination revealed right paravertebral muscle spasm. Her WBC was 4,500/mm<sup>3</sup> with 40 percent lymphocytes. Her EBV antibody titers are shown in the Table. She was treated with ibuprofen (800 mg tid) and cimetidine. She has improved significantly and is currently being followed.

### Comments

These three aforementioned patients are representative of other patients I have seen in my practice. They present with a painful local muscle spasm in a distinct area (the paravertebral thoracolumbar region) with the pain being referred along the path of the erector spinae muscles. The chronic fatigue and recurrent upper respiratory infections are also prominent features of this syndrome. The signs and symptoms of this syndrome do not necessarily occur at the same time. Patients may present initially with an upper respiratory infection, and later with the characteristic muscle spasm and fatigue. Others may present with all three signs and symptoms at the same time.

The muscle spasms found in these patients resemble the myofascial pain syndrome,<sup>1</sup> and the fibromyalgia syndrome.<sup>2,3</sup> These disorders are not uncommon; they affect some six million Americans.<sup>4</sup> Patients with myofascial pain syndrome and fibromyalgia syndrome have diffuse, chronic musculoskeletal pain that begins as a localized problem and then radiates to other areas. The pain of these two syndromes and the syndrome found in my patients have a definite paresthetic quality which mimics a neuropathy, suggesting that a neurotropic virus, such as EBV, may be responsible for the unexplained pain and profound fatigue. Neurologic complications can occur in primary EBV infection. In addition to encephalitis (which resembles aseptic meningitis), cases of Guillain-Barre syndrome, Bell's palsy, and transverse myelitis have been reported in primary EBV infection.<sup>5</sup>

Even though the chronic neurological sequelae of EBV infections are considered uncommon, a Bronx, NY physician has recently reported having as many as forty to fifty patients with EBV-related neurological disease in his practice.<sup>6</sup> This report is in line with the relatively large number of patients that I am seeing in my practice who apparently have a neuropathy associated with a chronic EBV infection.

Significant serial changes in the EBV-specific antibody levels of these patients indicate that EBV may be one of the etiologic agents responsible for the muscle spasm, fatigue, and upper respiratory infections. All of these patients have had high levels of EBV antibody titers, specifically VCA-IgG, EA-Ab, and EBNA, which are consistent with reactivated past infection.<sup>7</sup>

This syndrome should be included in the list of EBV-associated diseases, such as chronic mononucleosis-like syndrome, even though the possibility of other known and as yet unidentified viruses has not been explored. The likelihood of another virus as a causative or casual agent is high in view of the recent dis-

covery of a second widespread strain of EBV,<sup>8</sup> and the identification of several genomically distinct strains of EBV circulating among students at a California University.<sup>9</sup>

Numerous disease states are associated with EBV, including infectious mononucleosis, Burkitt's lymphoma, and nasopharyngeal carcinoma. The EBV is ubiquitous to humans. It invariably causes chronic infections in all persons it infects. It is a deoxyribonucleic acid (DNA) oncogenic virus. And, it has a close association with the immune system because it has an apparent tropism for B-lymphocytes. Epstein-Barr virus-related lymphoproliferative syndromes associated with immunosuppression have been observed in patients receiving cyclosporine-A after renal and bone marrow transplantation, as well as in patients with acquired immunodeficiency syndrome (AIDS).<sup>7</sup>

The EBV integrates its genome into circulating B-lymphocytes where it has a lifelong residency in the immune system. In this regard, it is a potentially devastating pathogen. More immuno-related diseases associated with EBV are being reported. For example, EBV has been implicated in the pathogenesis of rheumatoid arthritis (RA),<sup>10</sup> and significantly high levels of antibodies to EBV antigens have been found in patients with familial RA.<sup>11</sup> This suggests that an immunoregulatory defect may exist in some patients with RA as well as in patients with the syndrome described here.

It is noteworthy that patients with this syndrome have usually responded favorably to ibuprofen. In fact, ibuprofen seems to have significantly shortened the course of the disease. In this regard, it is tempting to speculate that ibuprofen, and perhaps other nonsteroidal anti-inflammatory drugs, may have a direct or indirect action in affecting the virus(es) responsible for this syndrome.

## Board of Physician Quality Assurance Actions

### In the Matter of James E. Crosby MD Before the Maryland Board of Physician Quality Assurance

#### Consent Order

On December 29, 1988, the State Board of Physician Quality Assurance (the Board), pursuant to its authority under *Md. Health Occ. Code Ann.*, §14-504, summarily suspended the license of James E. Crosby MD (the Respondent) to practice medicine in Maryland in an Order for Emergency Suspension of Right to Practice Medicine (the Emergency Order).

At the same time, the Respondent was charged under *Md. Health Occ. Code Ann.*, §14-504(a)(28) (1988 Cum. Supp.).

Section 14-504(a)(28) provides:

Subject to the hearing provisions of §14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:

(28) sells, prescribes, gives away, or administers drugs for illegal or illegitimate medical purposes.

On February 1, 1989, a settlement conference was held. At the settlement conference, Dr. Crosby stated that he did not contest his summary suspension. On February 22, 1989, a second settlement conference was held. At the second settlement conference, Dr. Crosby provided the Settlement Officers with a contract into which he had entered with the Physician Rehabilitation Committee of the Medical and Chirurgical Faculty of Maryland (the Committee). On October 3, 1990, a third settlement conference was held. As a result of the third settlement conference a proposal for resolving the outstanding charges was presented to the Board. At its meeting on October 24, 1990, the Board agreed to accept this Consent Order which resolves the charges under the Maryland Medical Practice Act and vacates the Order for Emergency Suspension of the Right to Practice Medicine.

#### Findings of Fact

1. Respondent was licensed to practice medicine in the State of Maryland on June 28, 1965.
2. Respondent's license to practice medicine in Maryland was summarily suspended on December 29, 1988.
3. Respondent was Patient A's primary physician from 1982 until November 1988 and treated Patient A for chronic obstructive pulmonary disease (COPD). In February 1988, Patient A became bedridden due to several crushed vertebrae. Patient A complained of severe back pain. Respondent treated Patient A at Patient A's home from February 1988 until April 7, 1988. During that time, Respondent prescribed Levodromoran and Demerol for relief of Patient A's pain.

5. Patient A was hospitalized at Frederick Memorial Hospital from April 7, 1988 to May 4, 1988.

6. Patient A returned home on May 4, 1988 and Respondent resumed primary care of Patient A. Respondent visited Patient A at home at least every other day from May 5, 1988 until Patient A was hospitalized on November 7, 1988.

7. From May 5, 1988 until November 7, 1988, Respondent wrote prescriptions for Demerol for Patient A which Patient A's wife took to several pharmacies. Whenever Respondent prescribed Demerol for injection, Respondent instructed Patient A's wife to have the prescription filled and give the vial to Respondent at his office. Patient A's wife did as Respondent instructed and gave the vial to either Respondent or Respondent's wife at Respondent's office immediately after the prescription was filled. Whenever Respondent prescribed Demerol tablets for Patient A, Respondent instructed Patient A's wife to get the prescription filled and put the Demerol tablets on Patient A's bedside. Patient A's wife did as Respondent instructed.

8. On several occasions, while Respondent was visiting Patient A, Patient A's wife saw Respondent open the bottle containing Demerol tablets on Patient A's bedside table and put Demerol tablets into Respondent's pocket.

9. While Patient A was bedridden, Patient A received Demerol injections from either Respondent or Respondent's wife, a nurse. No one other than Respondent or Respondent's wife gave Patient A Demerol injections. Either Respondent or Respondent's wife brought the vial of Demerol to Patient A's home for the injection. When Respondent and Respondent's wife left Patient A's home, they took the vial of Demerol.

10. In August 1988, Respondent's wife gave Patient A's wife a prescription for injectable Demerol written in the name of Patient A by Respondent. Respondent's wife asked Patient A's wife to get the prescription filled so that Respondent's wife could give it to another patient. Patient A's wife took the prescription to the pharmacy where it was filled. Patient A's wife gave the injectable Demerol to Respondent's wife. Patient A's wife believed that the Demerol was not intended for Patient A.

11. Based on certain information which came to its attention, the Board initiated an investigation into Respondent's practice of prescribing and dispensing controlled dangerous substances for Patient A.

12. In connection with the Board's investigation, the Division of Drug Control of the Department of Health and Mental Hygiene performed a drug survey of seven pharmacies in Frederick, Maryland where Respondent practiced medicine.

13. The drug survey revealed that Respondent wrote the following prescriptions for Patient A:

Prescription Number	Date	Drug	Strength	Quantity
906838	02/24/88	Levo-Dromoran	2 mg	24 tablets
906978	02/29/88	Levo-Dromoran	2 mg	48 tablets
907232	03/07/88	Levo-Dromoran	2 mg	24 tablets
543076	03/14/88	Meperidine	50 mg	50 tablets
543077	03/14/88	Meperidine	50 mg/ml	30 ml
543329	03/20/88	Meperidine	50 mg	100 tablets
543523	03/25/88	Meperidine	50 mg/ml	30 ml
543751	03/31/88	Demerol	50 mg/ml	30 ml
543752	03/31/88	Demerol	50 mg	100 tablets
545142	05/12/88	Demerol	50 mg/ml	30 ml
545141	05/12/88	Demerol	50 mg	100 tablets
909905	05/19/88	Demerol	50 mg/ml	30 ml
545728	05/27/88	Demerol	50 mg/ml	39 ml

432072	10/10/88	Demerol	100 mg/ml	20 ml
915149	10/11/88	Demerol	50 mg/ml	60 ml
432216	10/13/88	Demerol	100 mg/ml	20 ml
915267	10/14/88	Demerol	50 mg/ml	60 ml
915353	10/17/88	Demerol	50 mg/ml	60 ml
915571	10/21/88	Demerol	50 mg/ml	30 ml
915679	10/25/88	Demerol	50 mg/ml	30 ml
915773	10/26/88	Demerol	50 mg/ml	60 ml
915948	10/29/88	Demerol	50 mg/ml	60 ml
916065	11/01/88	Demerol	50 mg/ml	30 ml
916126	11/02/88	Demerol	100 mg/ml	20 ml
916251	11/05/88	Demerol	50 mg/ml	60 ml

14. Patient A had a history of COPD. Based on the amounts of Demerol prescribed by Respondent, Patient A was at risk for respiratory arrest if he actually received the amount of Demerol Respondent prescribed.

15. There was no medical reason for Respondent to

write a prescription for Demerol 50 mg/ml, 30 ml and Demerol 100 mg/ml, 10 ml, and Demerol 100 mg, 70 tablets on July 8, 1988.

16. Levo-Dromoran and Meperidine (Demerol) are Schedule II controlled dangerous substances.

17. It is unlawful for a practitioner to prescribe any controlled dangerous substances except in the course of his regular professional duties and in conformance with the provisions of Md. Ann. Code Art. 27, §§276 *et seq* (1987), and the standards of his particular profession relating to controlled dangerous substances.

18. Writing prescriptions for Demerol for one patient when the Demerol is intended for use by another patient is unlawful.

19. On or about February 21, 1989, Respondent entered into a five year advocacy contract with the Physician Rehabilitation Committee of the Medical and Chirurgical Faculty of Maryland. In April 1990, Respondent stopped his drug treatment and monitoring because of ill health.

### Conclusions of Law

Based upon the Findings of Fact, the Board concludes, as a matter of law, that Respondent sold, prescribed, gave away, or administered drugs for illegal or illegitimate purposes.

### Order

Based on the foregoing Findings of Fact, it is this 17th day of December 1990, by an affirmative vote of the majority of the full authorized membership of those members of the Board of Physician Quality Assurance of Maryland who considered this case,

ORDERED that the Order for Emergency Suspension is VACATED and the Respondent's license to practiced medicine in the State of Maryland SUSPENDED. Within four weeks of the effective date of this Order, the date being the date the Board executes this Order, Respondent is placed on the following conditions of probation for a period of six months from the date of this Order:

1. Respondent must enter into a Board-approved contract with the Committee and comply with all conditions of that Physician Rehabilitation Advocacy Contract dated November 29, 1990. Respondent must sign within ten days of the effective date of this Order a release, authorizing the Committee to release any and all information to the Board whenever the Board requests any information.

2. Respondent must successfully complete a Board-approved refresher course in the general practice of medicine. Respondent must submit a description of the course to the Board for approval within sixty days from the effective date of this Order. Successful completion of the refresher course does not count toward completion of the continuing education requirements.

3. Respondent agrees to sign releases permitting the Board to obtain information about Respondent

from any other relevant individuals or organizations as requested by the Board, and be it further

ORDERED that if Respondent does not comply with the above described conditions within six months from the date of this order, Respondent's license to practice medicine will be REVOKED WITHOUT PRIOR NOTICE AND AN OPPORTUNITY TO BE HEARD, and be it further

ORDERED that if Respondent complies with the above described conditions within six months from the date of this Order, the Board will entertain a petition for Respondent to take the Special Purpose Examination (SPEX) in June 1991, and be it further

ORDERED that if Respondent successfully passes the SPEX with a passing grade of at least 75, Respondent may submit a petition to the Board to stay the suspension of his license; i.e., a petition for reinstatement of his license. In the petition for reinstatement, Respondent must include a description of his anticipated practice and must also agree not to prescribe controlled dangerous substances in his practice. The Board may impose conditions of probation if the Board decides to stay the supervision of Respondent's license, and be it further

ORDERED that Respondent will be responsible for all costs incurred under this Consent Order, and be it further

ORDERED that this Consent Order is considered a public document pursuant to *Md. State Gov't Code Ann.* §§10-611 *et seq.*

ISRAEL H. WEINER MD, Chairperson  
Maryland Board of Physician Quality Assurance

### Consent

By signing this Consent, I hereby accept and agree to be bound by the foregoing Consent Order and its conditions and restrictions, consisting of 11 pages.

1. By signing this Consent, I hereby submit to this Order and its conditions.

2. I acknowledge the validity of this Order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this Order.

3. I acknowledge that by consent to this Order, I am waiving my right to challenge in court the legal authority of the Board of Physician Quality Assurance to take emergency and summary action against my license to practice medicine in the State of Maryland.

I, James E. Crosby MD, have read this Consent Order and have carefully reviewed each and every part with my attorney, James W. Respass. I understand it and voluntarily agree to it.

I sign and consent to this Order after having an opportunity to consult with counsel and with full understanding of the meaning and terms of the Order.

JAMES E. CROSBY MD

**In the Matter of  
Arthur M. Lebson MD  
Before the  
Maryland Board of  
Physician Quality Assurance**

**Order for Summary Suspension of License to  
Practice Medicine**

The Board of Physician Quality Assurance (the Board) herein sets forth the following background information as pertinent to this Order for Summary Suspension (the Summary Suspension) with regard to the license of Arthur M. Lebson MD (the Respondent) to practice medicine in the State of Maryland:

1. The Respondent is a physician licensed to practice medicine in the State of Maryland. The Respondent specializes in Internal Medicine and Geriatrics. The Respondent has been licensed to practice in Maryland since 1974.

2. The Respondent is presently practicing medicine at Fords Lane, Baltimore, MD. The Respondent has privileges at Sinai Hospital, Homewood Hospital Center, Baltimore County General Hospital, Seton Hill Manor Nursing Home, Harford Garden Center, Milford Manor Nursing Home, Meridian Nursing Center - Randallstown, and Wyman Park/Homewood Hospital Center North.

3. In 1990, the Medicaid Fraud Unit of the Attorney General's Office of the State of Maryland initiated an investigation into Respondent's practice. During the course of the investigation, information was obtained from certain patients who alleged that Respondent prescribed controlled dangerous substances to patients with known substance abuse problems in return for sexual favors. Since this information was directly pertinent to and raised concerns regarding the public health, safety and welfare, this information was referred on November 13, 1990 by the Medicaid Fraud Unit to the Board of Physician Quality Assurance.

4. Following receipt of the complaint, the Board commenced an investigation of the Respondent's medical practice. This investigation focused on information obtained from three areas: (1) interviews of certain patients who asserted that sexual favors were being exchanged for drugs; (2) surveys of Respondent's prescribing practices; and (3) consultation with experts in the field of drug and alcohol abuse.

5. The results of the investigation into claims that drugs were exchanged for sexual favors are summarized in Section A of this Order.

6. The results of the investigation regarding Respondent's prescribing practices are detailed in Section B of this Order.

### SECTION A

7. Several interviews of female patients and, in some cases, their boyfriends and husbands, were conducted by investigators of the Medicaid Fraud Unit of the Attorney General's Office during October and November, 1990.

8. The results of these interviews demonstrate a disturbing pattern of behavior usually involving Respondent's demands for sexual favors in return for controlled substances, sexual activity between Respondent and patient in Respondent's office and, in some instances, the reduction of controlled substances where sexual favors were denied.

9. The activity set forth in Paragraph 3 above was confirmed by a Board investigator in face-to-face interviews with certain patients.

10. The results of this investigation are summarized as follows:

*Patient A*<sup>1</sup> had been on a Methadone program prior to seeing Respondent. Patient A's office visits included complete physical examinations, AIDS testing, and prescriptions for Xanax, Placidyl, Desyrel, Tuinal, Pamelor and Klonidin. Patient A stated that for a period of five years she performed sexual acts with the Respondent at his office in exchange for his giving her prescriptions for numerous controlled dangerous substances. Patient A last visited Respondent's office in 1989 at which time Respondent reduced the quantity of controlled substances prescribed to Patient A.

*Patient C* stated that she began seeing the Respondent at his office in 1977 when her family physician retired. Patient C saw the Respondent from 1977 until 1979, during which time he had been treating her for obesity and had been prescribing Preludin and Fastin. Patient C did not see Respondent again until May, 1988. She went to the Respondent after having surgery and after receiving a prescription for Percodan and Valium from her surgeon. Patient C went to the Respondent seeking a general medical doctor and relief from her back pain.

During Patient C's first visit to the Respondent in 1988, she states that Respondent gave her a complete physical and asked her about sexual relations with her boyfriend.

Subsequently, Patient C would see Respondent once every two weeks and Respondent would give her at least three prescriptions on each visit. During this time period, Respondent provided prescriptions at various intervals for Percodan, Prozac, Elavil, Tegretol, Xanax, and Dilaudid.

Patient C states that Respondent made sexual advances toward her during office visits.

Patient C stopped seeing the Respondent in June 1990 and, thereafter, entered a hospital for detoxification and rehabilitation. Patient C states that she now attends Narcotics Anonymous regularly and has a new medical doctor who is also her drug counselor.

*Patient D* stated that she was treated by the Respondent for a brief period of time after being referred to him by some people at her drug program.

Patient D stated that the first time she saw Respondent everything about her examination was routine. Respondent drew blood and gave her a breathing test. She advised Respondent that she was a former drug addict and that she was on Methadone. Her presenting complaint was of depression and she asked for Xanax. At the end of her first session with Respondent,

Respondent wrote her a prescription for Xanax and another drug.

Patient D stated that on her second visit to the Respondent, while she was waiting for her prescription, Respondent made sexual advances toward her. The Respondent asked Patient D to go on a date with him and she responded saying she had a boyfriend and she could not do that. Patient D indicated that the Respondent then told her that he was going to have to cut her medicine down. The Respondent then wrote a prescription for Xanax in an amount that was less than she had received on a previous visit.

On her third visit, she was again alone in the room with the Respondent when he made sexual advances. She again pushed him away and refused his offer of going out with him. At that time, the Respondent told her he was going to cut down her medication and he proceeded to give her a prescription for fewer Xanax than on previous visits.

On her fourth and final visit, the Respondent once again made sexual advances. On her refusal to comply, Respondent again told her that he was going to cut her medication down. He then gave her a prescription for Xanax in an amount less than that received on previous visits.

Patient D also stated that the Respondent grabbed her breasts so hard they were bruised. These bruises were, on at least one occasion, observed by her boyfriend. Patient D said that his handling of her breasts was extremely painful.

*Patient E* stated that sometime early in the 1980s she was on a methadone program and met another patient of the Respondent's who advised Patient E that she could get Ativan from the Respondent.

During her first appointment with Respondent, one of his nurses took vital signs and placed her in an examining room. The Respondent came in several minutes later, and after talking with her, made sexual advances. When Patient E objected and stated that she was a paying customer, the Respondent continued and requested sexual favors from Patient E. The Respondent wrote her prescriptions and then left. Patient E stated that she had an appointment with the Respondent every month for approximately six to eight months and at each visit she performed sexual acts with the Respondent in order to obtain the prescriptions she desired.

After approximately six to eight months of appointments with the Respondent, Patient E stopped going to see the Respondent. All the incidents between Patient E and the Respondent occurred during her scheduled medical appointments at Respondent's office.

*Patient F* had her first appointment with the Respondent in late 1987 or early 1988. At her first appointment with the Respondent, a nurse took her history and vital signs. The Respondent then conducted breathing tests and drew blood. At that time, the Respondent requested sexual favors from Patient F. Each time Patient F went to see the Respondent until May of

<sup>1</sup> Patient names are not used in the Summary Suspension. The Board maintains a list of patient names which corresponds to the alphabetical letter used in the Summary Suspension.

1990, the Respondent requested sexual favors from Patient F.

Patient F received prescriptions from the Respondent for Percocet, Xanax, and Elavil. At some appointments, Respondent gave Patient F samples of Xanax without a prescription. During the time that Patient F was being treated by the Respondent, he would sometimes require her to call and schedule appointments for Saturday or Sunday. During these weekend appointments, Respondent would request sexual contact with her in exchange for drug samples or prescriptions. On one occasion, the Respondent had Patient F call to meet him at the hospital. She went to the hospital and had him paged. When he met her in the lobby of the hospital, he directed her to meet him at his office several hours later. When Patient F went to his office he wrote her prescriptions and then requested sexual contact. While at his office, the Respondent provided her with some sample blister packs of Xanax.

### SECTION B

11. Pharmacy surveys and a review of the pertinent medical records reveal that the Respondent is prescribing controlled dangerous substances with blatant disregard for the potential for abuse and drug dependency. Respondent's prescribing practices are below the standard of care in the following instances:

*Patient G:* Pharmacy records reveal that the Respondent prescribed the following controlled dangerous substances for Patient G:

Date	Drug	Quantity
1/30/89	Xanax 1 mg	100
2/24/89	Percocet	20
	Xanax 1 mg	100
6/13/89	Percocet	40
	Xanax 1 mg	100
2/20/90	Roxicet	50
	Xanax 1 mg	60
	Phenobarbital 30 mg	100
3/20/90	Percocet	
	Xanax 1 mg	75
4/20/90	Percocet	60
	Xanax 1 mg	75
	Phenobarbital 30 mg	100
6/08/90	Phenobarbital 30 mg	100
	Xanax 1 mg	75
	Percocet	50
6/11/90	Percocet	50
7/06/90	Xanax 1 mg	75
	Percocet	60
8/08/90	Roxicet	50
	Xanax 1 mg	75
	Phenobarbital 30 mg	100
9/07/90	Xanax 1 mg	75
	Roxicet	60

Xanax is indicated for the management of anxiety disorders or for the short-term relief of the symptoms of anxiety. The effectiveness of Xanax for long-term use (i.e., more than four months) has not been established by systematic clinical trials. According to the *Physicians' Desk Reference (PDR)*, "the physician should periodically reassess the usefulness of the drug for the individual patient."

The usual starting dose of Xanax is 0.25 to 0.5 mg

given three times daily. Writing an initial prescription for 100 Xanax 1 mg and prescribing 60 Xanax 1 mg less than three weeks after the first prescription, exceeds the recommended daily dose. In addition, continuing to write prescriptions for Xanax for nine months indicates Respondent's unwillingness to recognize the risk that the patient may become dependent upon the drug.

Roxicet and Percocet are narcotic analgesics which may be habit-forming. Prescribing these narcotics for nine months increases the risk of drug dependency.

By prescribing Xanax, Roxicet, and Percocet for nine months, the Respondent increased the likelihood that Patient G would become dependent on one or more of these drugs. The medical records indicate that the patient was admitted for detoxification in August 1988 and February 1990. In April 1990, the Respondent noted that the patient "is still occas IVDA [intravenous drug abuser]."

*Patient H:* Upon the initial visit, Respondent diagnosed Patient H as an intravenous drug abuser with low back pain. A review of Patient H's medical chart reveals that Respondent wrote the following prescriptions:

Date	Drug	Quantity
09/8/89	Percocet	50
10/6/89	Percocet	50
11/28/89	Percocet	60
12/01/89	Percocet	60
	Placidyl	15
02/13/90	Percocet	40
02/27/90	Percocet	60
03/27/90	Percocet	60
07/20/90	Percocet	50
	Desyrel	150
08/24/90	Percocet	40
09/23/90	Percocet	40
	Xanax 1 mg	40
11/26/90	Percocet	40
	Xanax 1 mg	60

According to the Respondent's note on December 1, 1989, the patient lost her husband and three-year-old daughter when a fire destroyed her home. Since everything was destroyed in the fire, the Respondent wrote another prescription for Percocet on December 1, 1989 and also prescribed Placidyl. On February 13, 1990, the Respondent noted: "still IVDA." On July 20, 1990, the Respondent recorded that the patient had been admitted to Greater Baltimore Medical Center for cocaine detoxification.

During the thirteen months that the Respondent treated Patient H, the Respondent occasionally referred to the patient's low back pain as "better" or "worse." However, there is no medical assessment by the Respondent of the pain nor is there any attempt to treat the pain except to prescribe Percocet. Knowing the patient's history as an intravenous drug abuser, the Respondent's practice of prescribing Percocet for thirteen months created a risk that the patient might become dependent on Percocet.

On July 20, 1990, the Respondent noted that the Patient was still grieving about "death" and the

Respondent prescribed Desyrel, an antidepressant. On September 28, 1990, the Respondent noted "manic depressive illness" and prescribed Xanax, an anxiolytic. However, on November 6, 1990, the Respondent recorded "general stress" and prescribed Xanax. There is no objective data in either note to indicate how the Respondent arrived at his diagnoses. Changing medications without evaluating the efficacy of one drug versus another is below the standard of care. In addition, the chart is devoid of any reason for increasing the quantity of Xanax prescribed from 40 to 60. According to the *PDR*, anxiety or tension associated with the stress of everyday life usually does not require treatment with an anxiolytic. In addition, the *PDR* cautions that physicians who prescribe Xanax to drug addicts should carefully supervise the patients' treatment because of the predisposition of such patients to habituation and dependence.

*Patient I's* medical records contain several references by the Respondent to Patient I's current status as an intravenous drug abuser. Pharmacy records reveal that the Respondent wrote prescriptions for the following controlled dangerous substances:

Date	Drug	Quantity
6/09/89	Roxicet	40
	Xanax 1 mg	75
7/03/89	Roxicet	20
	Xanax 1 mg	60
7/17/89	Roxicet	30
7/31/89	Roxicet	20
	Xanax 1 mg	60
8/21/89	Roxicet	40
	Xanax 1 mg	80
9/15/89	Vicodin	60
	Xanax 1 mg	60
9/29/89	Prometh VC Codeine	180 ml
10/12/89	Prometh VC Codeine	180 ml
10/13/89	Xanax 1 mg	60
11/10/89	Roxicet	30
12/14/89	Xanax 1 mg	50
01/10/90	Roxicet	25
	Roxicet	20
	Xanax 1 mg	50
02/13/90	Roxicet	20
	Prometh VC Codeine	240 ml
02/24/90	Xanax 1 mg	30
03/07/90	Xanax 1 mg	30
03/13/90	Prometh VC Codeine	180 ml
03/20/90	Prometh VC Codeine	180 ml
	Xanax 1 mg	30
03/22/90	Xanax 1 mg	30
04/16/90	Roxicet	30
	Xanax 1 mg	50
	Prometh VC Codeine	180 ml
04/25/90	Prometh VC Codeine	180 ml
05/14/90	Prometh VC Codeine	180 ml
05/24/90	Prometh VC Codeine	180 ml
06/15/90	Roxicet	30
	Xanax 1 mg	50
	Prometh VC Codeine	240 ml
06/27/90	Prometh VC Codeine	240 ml
07/13/90	Prometh VC Codeine	240 ml
09/17/90	Prometh VC Codeine	180 ml
	Roxicet	20
09/24/90	Prometh VC Codeine	180 ml
10/12/90	Prometh VC Codeine	180 ml
	Xanax 1 mg	45

10/19/90	Roxicet Prometh VC Codeine	20 180 ml
----------	-------------------------------	--------------

Beginning on September 15, 1989 and continuing through October 19, 1990, the Respondent prescribed Prometh VC Codeine, a narcotic cough suppressant which may be habit-forming. It is below the standard of care to prescribe a potentially addictive drug for such a long period of time to a known addict. In addition, the medical records do not reflect any valid assessment by the Respondent about the nature of the patient's cough or the efficacy of the Respondent's treatment.

Roxicet contains oxycodone, a narcotic which produces analgesia and sedation. Oxycodone can produce drug dependence and, therefore, has the potential for being abused. Psychic dependence, physical dependence, and tolerance may develop upon repeated administration of this drug. Prescribing Roxicet from June 9, 1989 through October 12, 1990 to a known addict indicated Respondent's unwillingness to recognize the risk that the patient may become dependent upon the drug.

Prescribing Xanax, another habit-forming drug, from June 9, 1989 through October 12, 1990, increases the patient's susceptibility to become addicted to another drug. In addition, the effectiveness of Xanax for long-term use (i.e., more than four months) has not been established by systematic clinical trials.

*Patient J:* Pharmacy surveys and a review of Patient J's medical record reveal that the Respondent prescribed Dilaudid, a narcotic analgesic, for several years. In 1985, the Respondent wrote prescriptions for Dilaudid 4 mg and Dilaudid 2 mg at the same time. Often these prescriptions were written every seven days or less. In 1986, the Respondent prescribed Dilaudid 4 mg every two to four days for two months. In addition, in 1986, a consultant recommended that the Respondent change Patient J's Dilaudid to Tegretol. In 1987, the Respondent recorded that he planned to admit Patient J for detoxification because of his addiction to Dilaudid. The Respondent noted that the patient complained of "seizures" when Dilaudid was discontinued. However, the Respondent continued to prescribe Dilaudid 4 mg until July 1990 when the Respondent lowered the dose to 3 mg and then, 2 mg.

Dilaudid is a schedule II narcotic for the relief of moderate to severe pain. According to the *PDR*, physical dependence, the condition in which continued administration of the drug is required to prevent the appearance of a withdrawal syndrome, usually assumes clinically significant proportions only after several weeks of continued narcotic use. By continuing to prescribe Dilaudid for three years after the Respondent recognized that the patient was addicted to the drug demonstrates a careless disregard for the patient's health.

*Patient K:* On August 23, 1989, Patient K sought treatment from the Respondent. In the history and physical standardized sheet, the Respondent noted the chief complaint as "MVA (motor vehicle accident)

1980" and neck spasms. The Respondent diagnosed "DJD" (degenerative joint disease) and "COPD" (chronic obstructive pulmonary disease). A review of the medical record and a pharmacy survey reveal that the Respondent wrote the following prescriptions:

Date	Drug	Quantity
8/23/89	Darvocet-N-100	60
9/01/89	Vicodin	30 (refill x 1)
9/06/89	Vicodin (refill)	30
9/11/89	Darvocet-N-100	60
9/20/89	Vicodin	30
	Centrax	30
11/15/89	Darvocet	40
12/13/89	Darvocet-N-100	40
	Tranxene	50
4/02/90	Darvocet-N-100	40
	Tranxene	60
	Tenuate	20
4/30/90	Darvocet-N-100	40
	Tranxene	60
	Tenuate	30
	Noludar	30
6/04/90	Darvocet-N-100	40
	Tranxene	
	Noludar	30
7/03/90	Tranxene	
	Noludar	
7/31/90	Tranxene	60
	Noludar	
	Darvocet-N-100	40
8/28/90	Tranxene	
	Darvocet-N-100	40

Darvocet-N-100 and Vicodin are narcotic analgesics which may be habit-forming. When taken over long periods of time, Darvocet-N-100 and Vicodin can produce drug dependence characterized by psychic dependence, physical dependence, and tolerance.

Tranxene and Centrax are benzodiazepines indicated for the management of anxiety disorders or for the short-term relief of the symptoms of anxiety. Addiction-prone individuals should be followed closely by a physician because of the predisposition of such patients to habituation and dependence. Long-term use (i.e., greater than four months) has not been clinically assessed.

Tenuate is an anorectic stimulant. Noludar is a hypnotic agent which induces sleep. There is no indication in the patient's chart for simultaneously prescribing two sedatives, a stimulant, and a hypnotic on April 30, 1989.

The Respondent's prescribing practices constitute dangerous medical practice. Prescribing two sedatives, a stimulant, and a hypnotic on the same day; continuously prescribing Darvocet-N-100 for twelve months; and prescribing benzodiazepines for eleven months, demonstrates the Respondent's lack of knowledge as to the hazards of combining these controlled dangerous substances. In addition, the quantity of controlled substances prescribed on each occasion poses a risk to the patient's health because of the possibility that the patient may overdose.

*Patient L:* On August 22, 1989, Patient L sought treatment from the Respondent for low back pain. The Respondent diagnosed chronic obstructive pulmonary disease (COPD).

Pharmacy records reveal that the Respondent wrote prescriptions for the following controlled dangerous substances for Patient L:

Date	Drug	Quantity
8/22/89	Percodan	30
9/22/89	Roxicet	30
10/20/89	Roxicet	30
11/17/89	Roxicet	50
12/15/89	Roxicet	50
01/12/90	Roxicet	50
02/09/90	Xanax 1 mg	60
03/09/90	Roxicet	60
03/23/90	Roxicet	60
04/06/90	Xanax 1 mg	60
04/20/90	Roxicet	60
05/04/90	Percocet	60
05/07/90	Xanax 1 mg	60
05/18/90	Roxicet	60
06/01/90	Roxicet	60
06/15/90	Roxicet	60
06/22/90	Roxicet	60
07/20/90	Roxicet	60
08/03/90	Roxicet	60
08/24/90	Roxicet	60
09/07/90	Roxicet	60

Opiates are contraindicated for patients with COPD because opiates cause respiratory depression. Percodan, Roxicet, and Percocet are opiates. Prescribing opiates for Patient L, whom the Respondent diagnosed as having COPD, is below the standard of care. In addition, these drugs can produce drug dependence and, therefore, have the potential for being abused. Prescribing opiates from August 22, 1989 through September 7, 1990, reveals Respondent's lack of knowledge about their addictive potential and increases the risk to the patient of developing a drug dependency.

Prescribing 180 Roxicet within a twenty-two day period from June 1, 1990 to June 22, 1990, poses a threat to the patient's safety because of the possibility that the patient may overdose.

*Patient M:* The Respondent began treating Patient M in March 1988 and diagnosed that the Patient had "bronchitis." The Respondent noted that he would attempt to wean her off of Xanax but prescribed 100 Xanax 1 mg. Respondent continued to prescribe 100 Xanax 1 mg on each visit for "hyperactivity life long."

Upon learning that Patient M was pregnant, the Respondent reduced the Xanax dosage from 100 per visit to 80 per visit and then 60 per visit. The Respondent's failure to wean Patient M from Xanax while pregnant, unnecessarily placed the fetus at risk for drug dependence. The Respondent noted in Patient M's chart that the baby had no withdrawal problems at birth.

The Respondent's prescribing practices demonstrate his disregard for the potential harmful affect of Xanax upon the developing fetus and the possibility for drug dependence.

*Patient N:* Pharmacy records level that Respondent prescribed the following controlled dangerous substances for Patient N:

Date	Drug	Quantity
11/21/88	Xanax 1 mg	100
6/22/89	Xanax 1 mg	67
7/10/89	Xanax 1 mg	100
8/7/89	Xanax 1 mg	100
8/28/89	Xanax 1 mg	100
9/18/89	Xanax 1 mg	100
10/16/89	Xanax 1 mg	100
11/17/89	Xanax 1 mg	100
12/12/89	Xanax 1 mg	100
	Halcion 0.25 mg	30
1/8/90	Xanax 1 mg	100
	Halcion 0.25 mg	30 (refill x 1)
1/21/90	Halcion 0.25 mg (refill)	30
2/5/90	Xanax 1 mg	100
	Halcion 0.25 mg	60
	Hycomine Syrup	180 ml
3/5/90	Xanax 1 mg	100
	Halcion 0.25 mg	60
	Hycomine Syrup	180 ml
3/26/90	Halcion 0.25 mg	50
	Xanax 1 mg	100
4/23/90	Xanax 1 mg	75
	Halcion 0.25 mg	30
5/21/90	Xanax 1 mg	75
	Halcion 0.25 mg	30
6/11/90	Xanax 1 mg	60
	Halcion 0.25 mg	30
7/11/90	Xanax 1 mg	50
	Halcion 0.25 mg	30
8/6/90	Xanax 1 mg	50
	Halcion 0.25 mg	30
	Percodan	10
8/20/90	Xanax 0.5 mg	30
8/21/90	Darvon	40
	Doral	15
9/12/90	Halcion 0.25 mg	30
	Xanax 1 mg	30
9/13/90	Darvon	40

Xanax is indicated for the management of anxiety disorders or for the short-term relief of the symptoms of anxiety. The effectiveness of Xanax for long-term use (i.e., more than four months) has not been established by systematic clinical trials. Prescribing Xanax from November 21, 1988 to September 13, 1990 demonstrates Respondent's disregard for the indications and use of Xanax. In addition, prescribing Xanax for such an extended period of time reveals Respondent's unwillingness to recognize the risk that the patient may become drug dependent.

Upon learning that Patient N was pregnant, Respondent continued to prescribe Xanax and Hycomine, an opiate. It is not known whether Hycomine can cause fetal harm when administered to a pregnant woman. According to the *PDR*, babies born to mothers who have been regularly taking opioids prior to delivery will be physically dependent. In addition, Respondent's failure to wean Patient N off Xanax during her pregnancy increased the likelihood of withdrawal by the baby postnatally. Prescribing Hycomine and Xanax throughout the patient's pregnancy exposed the baby to Hycomine and Xanax withdrawal.

Halcion is a hypnotic agent useful in the short-term management of insomnia. Halcion enhances central nervous system depressant effects when co-admini-

stered with other psychotropic medications, such as Xanax, which also produces central nervous system depression. Both drugs may be habit-forming. By prescribing Halcion and Xanax simultaneously, the Respondent increased the patient's risk for further central nervous system depression and drug dependency.

*Patient O:* Pharmacy records indicate that Respondent prescribed the following controlled dangerous substances for Patient O:

Date	Drug	Quantity
5/16/89	Xanax 1 mg	60
7/11/89	Xanax 1 mg	60
	Roxicet	120
8/8/89	Xanax 1 mg	60
	Roxicet	60
8/29/89	Xanax 1 mg	60
9/22/89	Xanax 1 mg	60
9/26/89	Xanax 1 mg	60 (refill x 2)
10/24/89	Xanax 1 mg (refill)	60
	Roxicet	50
11/7/89	Xanax 1 mg (refill)	60
12/11/89	Xanax 1 mg	30
	Roxicet	50
12/18/89	Vicodin	50
	Xanax 1 mg	60 (refill x 2)
1/15/90	Xanax 1 mg (refill)	60
	Roxicet	60
2/1/90	Darvon-N-100	40
	Xanax 1 mg (refill)	60
2/12/90	Vicodin	50
	Roxicet	50
2/26/90	Darvon-N-100	40
2/27/90	Xanax 1 mg	60
3/5/90	Vicodin	50
3/19/90	Xanax 1 mg	30
	Darvon	60
4/6/90	Roxicet	40
	Xanax 1 mg	30
	Doriden	30
4/24/90	Xanax 1 mg	60
	Roxicet	30
5/4/90	Doriden	30
	Roxicet	40
	Darvon	40
	Vicodin ES	50
5/18/90	Doriden	30
	Roxicet	35
	Xanax 1 mg	60
5/30/90	Roxicet	30
	Xanax 1 mg	75
6/13/90	Doriden	30
	Roxicet	30
	Darvon	100
6/27/90	Roxicet	40
	Xanax 1 mg	60
7/11/90	Xanax 1 mg	60
	Darvon	60
7/31/90	Doral 15 mg	30
	Vicodin	40
8/13/90	Xanax 1 mg	60
8/31/90	Xanax 1 mg	60
	Darvon-N-100	40

Roxicet, Vicodin, and Darvon are analgesics which may be habit-forming. Prescribing these drugs on a regular basis for thirteen months increases the likelihood that the patient may become addicted to one or more of these drugs. In addition, there is no medical reason to prescribe three analgesics, Roxicet, Darvon and Vicodin, on May 4, 1990.

Prescribing Xanax, another habit-forming drug, for sixteen months demonstrates the Respondent's unwillingness to recognize the risk that the patient may become dependent.

*Patient P:* Pharmacy records reveal that the Respondent prescribed the following controlled dangerous substances for Patient P:

Date	Drug	Quantity
1/24/89	Xanax 1 mg	60
	Placidyl 500 mg	30
2/21/89	Xanax 1 mg	60
	Placidyl 500 mg	30
4/20/89	Xanax 1 mg	60
	Placidyl 500 mg	30
5/16/89	Placidyl 500 mg	30
	Xanax 1 mg	60
6/13/89	Placidyl 500 mg	30
	Xanax 1 mg	60
7/14/89	Placidyl 500 mg	30
	Xanax 1 mg	60
8/11/89	Xanax 1 mg	60
	Placidyl 500 mg	20
9/6/89	Xanax 1 mg	60
	Placidyl 500 mg	30
10/4/89	Xanax 1 mg	60
11/2/89	Xanax 1 mg	60
11/29/89	Xanax 1 mg	60
	Placidyl 500 mg	30
12/27/89	Xanax 1 mg	60
1/3/90	Placidyl 500 mg	30
1/23/90	Placidyl 500 mg	30
1/24/90	Xanax 1 mg	60
2/26/90	Xanax 1 mg	60
	Placidyl 500 mg	30
3/26/90	Xanax 1 mg	60
	Placidyl 500 mg	30
4/23/90	Xanax 1 mg	60
	Placidyl 500 mg	30
5/23/90	Xanax 1 mg	60
	Placidyl 500 mg	30
6/18/90	Xanax 1 mg	60
	Placidyl 500 mg	30
7/16/90	Xanax 1 mg	60
	Placidyl 500 mg	30
8/20/90	Xanax 1 mg	60
	Placidyl 500 mg	30
9/17/90	Xanax 1 mg	60
	Placidyl 500 mg	30

Xanax is indicated for the management of anxiety. Placidyl is indicated as short-term hypnotic therapy for periods up to one week in duration for the management of insomnia. According to the *PDR*: "Prolonged use of Placidyl may result in tolerance and psychological and physical dependence. Prolonged administration of the drug is not recommended."

Prescribing Xanax and Placidyl on a regular basis for twenty-one months exceeds the manufacturer's recommendations for use for both drugs. Maintaining a patient on one or both drugs for such a lengthy period of time increases the likelihood that the patient will become dependent on one or both drugs.

### Findings of Fact

Based upon the information received by the Board in connection with its investigation, the Board has reason to believe that the following facts are true:

1. The Respondent is a physician licensed to practice medicine in the State of Maryland and specializes in the practice of Internal Medicine and Geriatrics.

2. The facts set forth in Section A are incorporated by reference herein.

3. The facts set forth in Section B are incorporated by reference herein.

4. The Respondent's practice of prescribing large quantities of Xanax over an extended period of time without periodically assessing the efficacy of the drug for the individual patient poses a serious threat to the health of any patient with symptoms of anxiety who seeks treatment from the Respondent because the Respondent's prescribing practice increases the likelihood that the patient will become dependent on Xanax.

5. The Respondent's practice of prescribing potentially addictive drugs for a long period of time to known drug addicts poses a grave danger to any addict who seeks treatment from the Respondent because the Respondent's prescribing practice enables the addict to maintain the addiction or to substitute one addiction for another.

6. The Respondent's practice of maintaining a known drug addict on the same dose of Dilaudid for several years after the addict showed signs of physical dependence on Dilaudid shows a careless disregard for the patient's safety and poses an imminent danger to any addict who seeks treatment from the Respondent.

7. The Respondent's practice of prescribing opiates over an extended period of time for a patient with chronic obstructive pulmonary disease presents a serious threat to the patient's health because the use of opiates in patients with COPD increases the likelihood of respiratory suppression and death.

8. The Respondent's practice of simultaneously prescribing stimulants and hypnotics creates a dangerous situation for any patient for whom Respondent prescribes these drugs because one drug counteracts the effect of the other drug.

9. The Respondent's practice of prescribing benzodiazepines and opiates to pregnant patients creates a serious risk of harm to the newborn because the use of opiates during pregnancy increases the likelihood of chemical dependency in the newborn and the use of benzodiazepines during pregnancy increases the possibility of withdrawal symptoms in the newborn.

10. The Respondent's conduct with regard to patients A, C, D, E, and F demonstrates moral and unprofessional conduct in the practice of medicine.

11. Based upon its investigation and a review of the materials provided, the Board has reason to believe that the Respondent violated the *Md. Health Occ. Code Ann.* §14-504(a)(3),(4), and (28) (1990 Cum. Supp.). The pertinent provisions of §14-504 provide:

(a) Subject to the hearing provision of §14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:

- (3) Is guilty of immoral or unprofessional conduct in the practice of medicine;
- (4) Is professionally, physically, or mentally incompetent;
- (28) Sells, prescribes, gives away, or administers drugs for illegal or illegitimate medical purposes.

12. The Respondent's retention of a license to practice medicine in Maryland and his ability to practice medicine and write prescriptions for controlled dangerous substances pose a grave risk and an imminent danger to the public health, safety, and welfare of the citizens of Maryland.

13. The Respondent's practice of prescribing controlled dangerous substances in both large quantities and large dose amounts represents a continuing danger to the health, safety, and welfare of the citizens of Maryland.

### Conclusions of Law

Based upon the foregoing facts, the Board finds that the public health, safety, and welfare imperatively require emergency action in this case, pursuant to *Md. State Gov't. Code Ann.* §10-405(b) (1984).

### Order

It is this 12th day of December 1990 by the State Board of Physician Quality Assurance:

ORDERED that pursuant to the authority vested in the Board by *Md. State Gov't. Code Ann.* §10-405(b) (1984), Respondent's license to practice medicine in the State of Maryland is hereby SUMMARILY SUSPENDED; and be it further

ORDERED that on presentation of this Order, Respondent shall immediately deliver or have delivered to the Board:

- (1) his original Maryland license from the Board of Medical Examiners;
- (2) his renewal card for this license to practice medicine from the Board of Physician Quality Assurance;
- (3) his U.S. Drug Enforcement Administration Registration Certificate;
- (4) his Maryland Controlled Dangerous Substances Registration Certificate;
- (5) all samples of all prescription drugs in the possession of Anther M. Lebson and Arthur M. Lebson PA, including samples stored at both the Respondent's office and private residence; and
- (6) any prescription pads on which his name and DEA number are imprinted; and be it further

ORDERED that, should the Respondent fail to appear at the Board meeting scheduled for Wednesday, December 12, 1990 at 2:00 p.m., that this Order shall become effective immediately in accordance with *Md. Health Occ. Code Ann.* §14-507(d) (1990 Cum. Supp.) and is a public order and in accordance with *Md. State Gov't. Code Ann.* §10-617 (1984).;

And be it further ORDERED that all patient names ascertained in the course of this matter are protected as confidential records of the Board and cannot be disclosed except pursuant to *Md. Health Occ. Code Ann.* §14-510 and §14-510.1 (1990 Cum. Supp.).

ISRAEL H. WEINER MD, Chairperson  
Maryland Board of Physician Quality Assurance

## In the Matter of Murray Steinberg MD Before the Maryland Board of Physician Quality Assurance Consent Order

On December 12, 1990, the Board of Physician Quality Assurance charged Murray Steinberg MD (the Respondent) with a violation of *Md. Health Occ. Code Ann.*, §14-504(12) (Charge Letter).

Specifically, pursuant to *Md. Health Occ. Code Ann.*, §14-504 (1986), the Board charged that Respondent:

Subject to the hearing provisions of §14-505 of this subtitle, the [Board], on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:

- (12) Willfully makes or files a false report or record in the practice of medicine.

During negotiations concerning the allegations which form the basis for these charges, the Respondent was represented by Daniel Clements, Esquire and the Administrative Prosecutor was Nancy P. Tennis, Assistant Attorney General. As a result of these negotiations, the Respondent and the Administrative Prosecutor agreed to enter into the following Consent Order, which includes Findings of Fact, Conclusions of Law and Order. The Consent Order was subsequently presented to, and accepted by, the Board on December 12, 1990.

### Findings of Fact

1. At all times relevant to these charges, the Respondent was and is licensed to practice medicine in Maryland.

2. On July 7, 1987, Dr. Steinberg was performing surgery on a Patient A who was scheduled for a laparoscopy and a possible laparotomy. During the course of the operation, Dr. Steinberg determined first that a laparotomy was required and subsequently decided that a hysterectomy was also necessary. He performed both operations that day.

3. The admission note in Patient A's chart, however, included the following sentence: "After reviewing the situation with her, I do not feel that we have any other means to diagnose this problem except by laparos-

copy, if the findings at laparoscopy warrant laparotomy we will go ahead with the procedure, however if total abdominal hysterectomy is indicated, patient prefers that we wait until the problem is discussed with her."

4. As Dr. Steinberg was about to perform the hysterectomy, the anesthesiologist for Patient A's operation saw the admissions note and questioned Dr. Steinberg as to whether the patient had consented to a hysterectomy.

5. Dr. Steinberg stated that she had consented to a hysterectomy. At that point, he consulted the patient's family and obtained their permission to perform the operation.

6. At some point following the operation, Dr. Steinberg removed the original admissions note from the hospital records of Patient A. He filed a second note in place of the first. The second note was identical to the first except that Dr. Steinberg omitted the phrase "however if total abdominal hysterectomy is indicated, patient prefers that we wait until the problem is discussed with her."

### Conclusions of Law

Based on the foregoing Findings of Fact, the Board concludes that the Respondent willfully made or filed a false report or record in the practice of medicine. Accordingly, the Board concludes, as a matter of law that the Respondent has violated §14-504(12) of the Act.

### Order

Based on the foregoing Findings of Fact and Conclusions of Law, it is this 12th day of December, 1991, by the Board, hereby:

ORDERED that Respondent be REPRI-MANDED; and be it further

ORDERED that Respondent submit to a peer review six months from the date of this Consent Order; and be it further

ORDERED that the above-mentioned peer review shall be performed by physicians who have not conducted a prior review of Respondent and that the peer review, if unfavorable, could result in an investigation of Respondent under Health Occupations Article, §14-501; and be it further

ORDERED that this is a final order and as such is considered a public document pursuant to State Government Article, *Annotated Code of Maryland*, §§10-611 *et seq.*

ISRAEL H. WEINER MD, Chairperson  
Maryland Board of Physician Quality Assurance

### Consent

By this Consent, I hereby admit to the Findings of Fact contained in this Order. I hereby agree to be bound by the foregoing Consent Order and its conditions and restrictions.

I am entering into this Consent Order for the purpose of resolving the charges initiated by the Board of Physician Quality Assurance against my license to practice medicine as defined in the Charge Letter.

I acknowledge the validity of this Order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this Order.

I hereby waive any right to appeal this matter under §14-508 of the Health Occupations Article, *Annotated Code of Maryland*.

I understand that if I fail to abide by the conditions of the Order, I may suffer disciplinary action against my license to practice medicine in the State of Maryland.

I sign and consent to this Order after having an opportunity to consult with my counsel, Daniel M. Clements, Esq., and with full understanding of the meaning and terms of the Order.

MURRAY STEINBERG MD

### Continuously Throughout the Year

**Visiting Professor Program** - A directory of speakers and their topics is available to area hospitals and other health care organizations. NO administrative fees are charged for this service. Info: 301-328-3956.

**Visiting Practitioner Preceptorships** - Opportunities for physicians to participate in clinical situations in the University of Maryland Medical Systems. Requires approval from clinical department/division heads. Hour-for-hour Cat 1 AMA/PRA credits available. Direct all inquiries to CME 301-328-3956.

**Departmental Rounds and Conferences** - Weekly, hands-on and lecture presentations hosted by the University's clinical departments. Hour-for-hour Cat 1 AMA/PRA credits available. Brochure available.

## PHYSICIAN'S RECOGNITION AWARD

### Recipients

During April 1991, the physicians listed below received the American Medical Association's (AMA's) Physician's Recognition Award. Established in 1968, the Award's purpose is to encourage physician participation in continuing medical education and to recognize those physicians who have voluntarily completed programs of continuing medical education.

Bhagavan, Belur S.  
Brown, Stephen Robinson  
Brown, William George  
Cosimano, Salvador J.  
Flynn, Robert Lawrence  
Ginsberg, Milton

Guba, Alexander M.  
Howe, Luke A.  
Judd, Kenneth Patrick  
Kress, Morton Allen  
Linhardt, George Elmer  
Mausner, Mark Ellis

Merrill, Roger Clay  
Myers, Henry J.  
Oldham, Roger Jay  
Porter, Roger John  
Shigo, John Joseph

## MISCELLANEOUS MEETINGS

- August 14-17** **West Virginia Medical Society Annual Meeting**, at The Greenbrier, White Sulphur Springs, WV. Cat 1 AMA/PRA credits available. Fee: \$125 members; \$175 nonmembers. Info: Nancie Divvens, 304-925-0342.

### Information for Authors

Manuscripts may be sent to Editor, **MMJ**, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

#### Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program.

Include full name of author(s) with highest degrees, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles.

Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the **Uniform Requirements for Manuscripts Submitted to Biomedical Journals** compiled by the International Committee on Medical Journal Editors (available through the **Annals of Internal Medicine**).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in **MMJ** is protected by copyright and may not be reproduced without the written permission of both the principal author and **MMJ**.

\* \* \*

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

Dear Carl,

Congratulations on your new medical staff leadership position! Now you're not only a physician — you need to be a manager, negotiator, arbitrator, and even a parliamentarian. I wish I had received some special training when I first took a position like yours!

Sincerely,

Helen

## Do you have the skills to do the job?

Chief-of-staff. Department chairman. Committee chair.

Tough jobs, but somebody has to do them — sometimes even with no formal training and little leadership experience.

Now, through a new American Medical Association training program, you can sharpen the skills you need to face the challenges of leadership with confidence and authority.

### **Interactions: A Medical Staff Leadership Program**

This intensive day-and-a-half program will help sharpen your ability to:

- Resolve conflict among peers
- Negotiate with the board and administration
- Manage medical staff affairs
- Develop bylaws that enhance staff effectiveness
- Run meetings effectively and purposefully

### **Learn from the Experienced**

*Interactions* was developed by experts in medical staff leadership and field tested by more than 100 medical staff leaders nationwide. The faculty includes experienced physician leaders as well as management and legal experts. Program features lectures, discussions, and break-out sessions on all aspects of medical staff leadership.

### **Take the Challenge**

If you have recently been chosen for an important leadership position — chief of staff, department chairman, committee chair, or another key post — *Interactions* will develop the skills and confidence to succeed in your new role.

Choose the dates and location that are best for you.

*“I have first-hand knowledge of the level of professionalism of Meridian’s staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents.”*

Theodore C. Patterson, M.D., Medical Director,  
Meridian Nursing Center—Heritage

#### **Partners in Healthcare**

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer’s patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at all our nursing centers. And special services like short-term or respite care, our own

pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there’s our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—  
The Professional Choice.

# Social Service or Business? Perspectives on Hospitals.

Hospitals today are solving problems that didn't exist five years ago. As you'd expect, many of these are medical challenges. But an increasing number involve another side of health care—rapidly changing technology, scarce personnel, non-traditional business ventures and more.

These are complex and sensitive issues, and you need to know about them. They'll have a significant impact on your health care—its cost, its quality, and even its availability.

In this article, we look at forces which have made these issues high priorities for hospitals and for Baltimore.

## The dilemma—can hospitals be both?

The chief task of a hospital is preserving life and caring for the sick. No mission is more critical than quality patient care.

Yet, hospitals must respond strongly and effectively

to problems facing them from the other side of health care—the business side. If they do not, the quality and even the availability of health care in our community will be jeopardized.

## The financial pressures are rising.

Historically, hospital charges covered costs plus a modest amount to pay for new equipment and to keep facilities current. In the early 1980's, Medicare nationally put a cap on what it would pay, much the same as when Maryland began regulating hospital rates in the early 1970's.

While the limits on reimbursement have proven

effective in moderating increases in prices, one pitfall is that less money is available now to pay the bills and keep equipment and facilities in good order. In 1989, almost half of *all* hospitals in Maryland lost money on operations. Continued losses will threaten hospitals' ability to carry out their mission.

## Challenges from all directions.

Other developments are also challenging hospitals' financial health and their ability to survive:

- **Inflation**—hospitals face increasing costs for goods and services which have outpaced the rate of inflation in the general economy. This is due to costs of new drugs, new technology and other medical supplies.
- **Technology**—hospitals must keep abreast of the latest changes in every area of the facility. For example, a CT scanner—standard equipment these days, costs over \$750,000. Necessary, but expensive.
- **Personnel shortages**—hospital personnel expenses account for 60% of the average hospital bill. Hospitals must

attract and retain highly skilled, scarce medical professionals.

- **Underinsured**—hospitals treat increasing numbers of people who are underinsured or who have no insurance at all. In the past ten years, the number of uninsured Americans has *risen* 25% and is likely to increase as the economy moves from a manufacturing to a service base, since small service firms often provide little or no health insurance.
- **Increased intensity**—while reimbursement for services is being limited, the intensity of care provided for each patient is rising. Patients hospitalized today are more sick and require more tests and procedures in a shorter period of time than ever before.

## Business strategies protect hospitals' social mission.

Hospital boards, management, physicians, nurses and other medical professionals are all working aggressively to protect both the basic mission *and* the bottom line. They are adapting business strategies to the particularly complex hospital environment. In fact, hospitals are able to provide an uncompromised level of quality care to their patients by:

- **Managing and measuring quality.** No single objective standard exists for measuring the value of treatment. Hospitals, however, are breaking new ground in evaluating and setting standards for measuring quality.
- **Broadening the revenue base.** By offering a wide range of non-traditional hospital-based services such as home nursing and medical equipment, hospitals have developed integrated health care systems which support the bottom line and ensure the availability of health resources to their communities.
- **Setting priorities for investing in new technology.** The decisions made today by hospitals affect the future availability of resources to the community. No longer able to simply purchase every new piece of equipment, hospitals are being forced to evaluate and prioritize new technology.
- **Finding and keeping the best health care professionals.** Recruiting, training and retaining medical professionals

in today's competitive environment is difficult. As the availability of trained professionals decreases, hospitals are finding new solutions and innovations to protect their most important resource.

- **Contributing to the economic viability of their communities.** Hospitals are seen as sources for the health and well-being of individuals, but they're also critical to the economic health of their community. Hospitals provide millions of dollars to the community in salaries and wages, supply purchases, community involvement and health education.

In future articles, we'll explore these efforts by hospitals to provide quality care while remaining financially strong.

Social service or business? As they seek solutions to the challenges of the medical marketplace, hospitals clearly must be both.

For a reprint of this, or any other article in this series, please call 828-GBMC (4262) or write: Community Relations, 6701 North Charles Street, Baltimore, MD 21204.

# Our Members Are Not Dying For A Free Tail.

Strangely enough, some companies are trying to sell Maryland physicians a professional liability policy that requires them to die or become permanently disabled in order to get a free tail. At Medical Mutual, our members can get a free tail while they are very much alive.

We make the tail available at no extra cost for those of you who are planning to retire from the practice of medicine after five consecutive years on our claims made and/or occurrence policy. If retirement is not in your plans, our tail is free at any age after 15 consecutive years on our claims made policy. As an added feature, you may step down from a higher rated specialty to a lower rated one with no tail charge for making the change.

Your broker or our Member Services Representatives can answer your questions about tail provisions for Medical Mutual members.

Of course, we also give a free tail in the event of your permanent disability or death.

We just don't think this should be your only choice.

# Making the right choices means asking the right questions.

You know the questions to ask your patients. Questions that will provide the information you need to make an informed decision about medical treatment.

When it comes to choosing a medical malpractice insurer, knowing which questions to ask--and how to interpret the answers--is no less important. Because just as your treatment decisions may have a lasting impact on your patient's long-term health, your choice of insurer may make all the difference to your professional and financial well-being in the years ahead.

In an uncertain medical situation, you might consult a specialist. When you're making decisions about insurance, why not consult with an insurance specialist? An expert who can suggest which

questions to ask, guide you through the technical jargon, and help you select the coverage that's right for you.

That's where Princeton's network of independent insurance agents comes in. Our agents understand the insurance needs of health care professionals. They'll show you how to compare costs and benefits, and help you avoid gaps or duplications in coverage.

Do ask an agent why Princeton should be your choice. Ask about our financial strength, about our claims management philosophy that vigorously defends physicians against meritless claims...and about our new office package policy that offers protection for your practice and premises. We think you'll like the answers.

***Quality Service to Our Physicians and Patients!***

# JUMBO MORTGAGE CLIENTS PREFER CHASE.

**WHY?** Because Chase Professional Banking offers the flexibility, financing options, and service designed to meet the needs of the busy executive or professional.

- ✓ **Large loan amounts.** Loans for purchase or refinance from \$250,000 to \$1,000,000 or more help you maximize your buying power.
- ✓ **Competitive rates and low closing costs.** Chase does not require tax or insurance escrows, or private mortgage insurance. This can substantially reduce your initial expenses. Zero-point quotes are available.
- ✓ **Fast response.** Chase professional bankers guarantee a timely response to your loan request.
- ✓ **Exceptional service.** All mortgages remain in our portfolio, ensuring superior service over the life of the loan.

Chase Professional Banking also offers:

- A variety of high-yield deposit products.
- Home equity lines of credit up to 95% of the value of your home.
- Unsecured lines of credit up to \$50,000.
- Luxury auto loans with terms up to 7 years.
- Marine loans up to \$250,000.

Chase Professional Banking is the choice for executives and professionals. Our resources and services are at your disposal--at your convenience.

Chase Bank of Maryland is a subsidiary of the  
Chase Manhattan Corporation.

# At the SurgiCenter, we've found a way to relieve the most common discomfort of all.

Tired of the paperwork and red tape most hospitals put you through?

Then consider operating out of the SurgiCenter of Baltimore.

Thanks to the latest in state-of-the-art medical equipment, a supporting staff of the area's most caring and capable nurses and technicians, and a comfortable, intimate setting, we're able to fully meet your same-day surgical needs.

Without causing you or your patients any undue stress or discomfort.

And unlike high-traffic hospitals, we're committed to one thing

and one thing only — outpatient surgery. So we can operate more efficiently, and with less overhead. A point your patients are sure to appreciate come billing time.

We're also easy to get to. And we'll bend over backwards to make sure you have a room when you need it.

Plus, we have agreements with all the major insurance carriers and HMO's in the state.

So drop by for a tour. Any time. Or call 356-0300 for more information.

Find out why nearly 100 of the area's finest physicians and

surgeons are operating at the SurgiCenter of Baltimore.

And turn what used to be a complex and painful procedure into a breeze.

# EPIDEMIOLOGY & DISEASE CONTROL PROGRAM

201 W. Preston Street, Baltimore, Maryland 21201 (301)225-6700

August, 1991

## SELECTED COMMUNICABLE DISEASES IN MARYLAND IN 1990

(Continued)

### HAEMOPHILUS INFLUENZAE

#### DISEASE (57)

1.2/100.000 (U.S. Not Available)

A decline of *H. influenzae* disease by 22% from 1989 and by 53% from 1988 was noted in 1990 (Figure 3). Table 1 (see July, 1991 issue) shows the number of cases by county. More than 40% of the cases were reported from Prince George's (16) and Montgomery (7) coun-

Figure 3

ties. More illness occurred during the first part of the year; the peak month was April (11 cases). The male to female ratio was 0.7:1.0. The ratio of whites to blacks was 1.9:1.0; one patient was Hispanic.

The number of cases by age group from 1986 to 1990 is presented in Figure 3. Over the past 4 years there has been a large decrease in the age group between 3 month and 15 months, even though no vaccine was licensed for these children. Forty-seven (82.5%) of the cases in 1990 were less than 6 years of age, including 6 newborns. As expected, 0 through 4 year old children had the highest age-specific incidence rate for 100,000 population (14.0

overall; 11.1 for males, and 17.0 for females). Of the 8 (14.0%) cases in 1990 who were eligible for Hib vaccination (18 months to 5 years of age), 6 had not been immunized, one 2 year old child had been vaccinated at approximately 17 months of age, and 1 had unknown vaccination status.

Information on ampicillin resistance of *H. influenzae* isolates from 30 patients showed that 57.0% were resistant to ampicillin, compared to 33.8% (68 isolates tested) in 1985 and 15.4% (39 tested) in 1981.

The type of illness caused by *H. influenzae* disease included meningitis (58.9%), bacteremia (26.1%), pneumonia (7.1%), conjunctivitis (3.6%), and epiglottitis 1.8%. Five cases are known to have died (for a case fatality of 8.8%), 44 survived, and the outcome for 8 patients was unknown. Use of the recently licensed Hib vaccines for infants beginning at 2 months of age should lead to further decreases in Hib disease.

### HEPATITIS A (866)

18.1/100,000 (U.S. 11.4/100,000)

The trend of hepatitis A from 1980 to 1990 is illustrated in Figure 4. In 1990 there was a 28% decline from 1989. Decrease was observed in every jurisdiction,

Figure 4

including the metropolitan Baltimore area (Baltimore City, Baltimore County and Anne Arundel County) (Figure 6), and Frederick County, all of which experienced outbreaks of hepatitis A in 1989 (Table 3). In 1990 the Baltimore metropolitan area contributed 88.3% of all cases in the State. The number of cases by county is shown in Table 1 (see July, 1991 issue).

**Table 3. Hepatitis A Cases and Incidence Rates in the Baltimore Metropolitan area and Frederick County, 1989-1990**

Jurisdiction	1989		1990	
	Cases	Rate per 100,000	Cases	Rate per 100,000
Anne Arundel	140	32.7	49	13.1
Baltimore City	626	84.0	554	75.3
Baltimore County	226	32.9	155	22.4
Frederick	58	40.5	4	2.7

More than 63% of the 846 cases with known onset of illness occurred in January through May. The peak (130 cases) was in January; thereafter, a slow decline during each consecutive month brought the cases down to 23 in December.

**Figure 5**

The male to female ratio was 1.5:1.0. The ratio of whites to blacks was 1.5:1.0; 6 cases were Hispanic, 1 Asian, 6 other race, and the race of 208 (24.0%) cases was not specified.

Age- and sex-specific rates per 100,000 population are presented in Figure 5. The highest incidence rates occurred in males and females 20 to 29 years of age, (40.4 and 29.2 respectively). Among the cases with known sex and race in age group 15 to 39 years (566), the rate in non-white males (42.4) was 1.6 times higher than the rate in white males (26.3); the rate in non-white females (32.8) was twice as high as the rate in white females.

Of the 237 adult patients with known occupation, (excluding retired, unemployed, homemakers, etc.), 21 (8.5%) were health care providers, 20 (8.1%) were foodhandlers, 3 (1.4%) were day care facility employees. Of the 345 cases with known workplace, school, day care

facility, etc., 21 (6.1%) were working in foodhandling businesses, 20 (5.8%) worked in hospital or institutions for the disabled, 11 (3.2%) in day care facilities, kindergarten, etc.

A known or suspected source of infection was reported for only 173 (20.0%) of the cases. Of these, 88 (51.0%) had contact with a confirmed or suspected hepatitis A case, 31 (17.9%) used illegal drugs, (compared to 22.7% in 1989 and 13.0% in 1988), 15 (8.8%) had consumed potentially contaminated food, 10 (5.8%) were refugees/immigrants, 9 (5.2%) were employees or children in nursery, day care or pre-school facility, or had contact with such and 20 (12%) had other exposure. In a more detailed study conducted in Baltimore City, of 343 patients interviewed, 105 (43.2%) of 242 adults with hepatitis A admitted use of illegal drugs, and 105 of 343 adults and children (30.6%) indicated contact with a case of hepatitis A, 41 (12.0%) had contact with a child under 2 years of age, and 68 (19.8%) did not indicate any risk factors.

## HEPATITIS B (545)

**11.4/100 (U.S. 7.9/100,000)**

Hepatitis B has been declining since 1987 (Figure 4) and in 1990 was at its lowest level in 10 years. The number of cases by county is shown in Table 1 (see July, 1991 issue). The most noticeable decline in numbers and incidence rates per 100,000 population was observed in Baltimore City (from 39.5 in 1989 to 26.1 in 1990), Harford county (from 22.7 to 10.4), and Cecil County (from 21.4 to 15.4). Slight increases of hepatitis B rates occurred in Montgomery and Prince George's counties.

The only seasonal difference in onset of illness was a slight preponderance in the summer months. The male to female ratio was 1.5:1.0. The incidence rate in males was 14.5/100,000; in females 9.0/100,000. The rates per 100,000 population by age group and sex are presented in Figure 6. The highest rates were observed in males (29.7) and females (27.4) 20 to 29 years of age. The ratio of whites to nonwhites was 1.1:1.0, the race of 73

**Figure 6**

individuals was not known. The incidence rates per 100,000 population in nonwhites was 2.6 times higher than the rate in whites. The highest rate was observed among non-white males (21.1), followed by the rates in nonwhite females (15.8), white males (9.0) and white females (5.3).

Information on exposure during the 6 months prior to onset of illness and the probable source of infection was available for only 168 (31.1%) cases. Of these, 52 (31.0%) admitted drug use (a decrease from 46.5% in 1989 and 40.9% in 1988), 45 (26.8%) had contact with confirmed or suspected hepatitis B case, 45 (26.8%) had hetero- and unspecified sexual exposure, 9 (5.4%) -blood transfusion, 3 (1.8%) - homosexual exposure, 3 (1.5%) - needle stick, 1 (0.6%) - percutaneous exposure, other than I.V. drug use, tattoo, etc., 1 (0.6%) -perinatal exposure, 1 (0.6%) -dental work, 1 (0.6%) -human bite, and 6 (4.5%) - other exposure.

## HEPATITIS NON A - NON B (C) (45)

0.9/100,000 (U.S. 1.1/100,000)

The trend of nonA-nonB (C) hepatitis from 1980 to 1990 is illustrated in Figure 4. The decline which started in 1985 reversed in 1990 into an increase of 60.7% from 1989, when 28 cases were reported. The introduction in May, 1990, of a screening test for detection of antibodies to hepatitis C, initially used in blood donor centers, might have helped diagnose cases that otherwise would have been classified as unspecified hepatitis or remained unrecognized or unreported. Many persons with positive hepatitis C test results were investigated, examined, and, after excluding acute hepatitis A and B, were found to meet the CDC case definition of nonA-nonB hepatitis. The number of reported cases by county is shown in Table 1 (see July, 1991 issue). Even though Baltimore County was leading with eleven cases, the highest incidence rate was noted in Wicomico County (5 cases; 6.7/100,000). Cases occurred throughout the year; no seasonal pattern was observed.

Figure 7

The male to female ratio was 1.4:1.0; the ratio of whites to blacks was 4.3:1.0. Males, 30 to 39 years old (12 cases) had the highest incidence rate (3.1/100,000).

Suspected source of infection during the 6 months prior to the onset of illness was reported for only 10 of the cases (22.2%): 5 were illegal drug users, 2 had received blood or blood products by transfusion, 2 had sexual contact with cases of nonA-nonB hepatitis, and 1 had been exposed to a nonA-nonB case.

## LEGIONELLOSIS (48)

1.0/100,000 (U.S. 0.5/100,000)

Legionellosis was reported throughout the year from 14 jurisdictions. The number of cases by county is shown in Table 2 (see July, 1991 issue). The incidence rate in Washington County (13.2/100,000), the highest in Maryland, was due to an outbreak during the first part of 1990. The male to female ratio was 1.1:1.0.

Ages ranged from 11 to 90 years (mean 61.4, median 67 years). The incidence rate by age group is shown in Figure 7. While incidence rates per 100,000 for males and females were similar (1.1 and 1.0, respectively), age-specific incidence rates of persons older than 59 years of age (the most affected age group) were 5.4 for males and 3.7 per 100,000 for females. The ratio of whites to non-whites among the 39 persons with known race was 6.8:1.0.

Information on underlying medical conditions at the time of onset of legionellosis was available for 23 patients: 5 were undergoing systemic corticosteroid treatment, 4 had diabetes mellitus, 1 had cancer, 7 were smokers (>10 cigarettes/day), and six did not indicate underlying illness. There were 4 deaths; 35 survived and the outcome for 9 was unknown.

## LYME DISEASE (238)

5.0/100,000 (U.S. Not Available)

A case of Lyme disease in Maryland is defined as any person with erythema migrans (at least 5 cm in diameter) diagnosed by a physician, or any patient with at least one late manifestation (rheumatologic, neurologic, or cardiac) and laboratory confirmation of infection (CDC. Lyme Disease National Surveillance Case Definition, July 1990). It should be emphasized that this case definition is intended for surveillance and reporting purposes only. Decisions regarding treatment should be based on a clinical assessment.) The laboratory confirmation may include isolation of the spirochete, *Borrelia burgdorferi*, from tissue or body fluid, detection of IgG or IgM antibodies to *B. burgdorferi* in serum or CSF, or detection of significant change in antibody levels in paired acute and convalescent serum

samples. The trend of Lyme disease in Maryland from 1986 to 1990 is shown in Figure 8.

In 1990 every county, except Garrett and Somerset reported Lyme disease; 15 counties contributed to the overall increase of almost 70 percent from 1989. The number of reported cases and the incidence rates per 100,000 by county in 1989 and 1990 is shown in Table 4.

**Table 4. Lyme Disease Cases and Incidence Rates by County, 1989-1990**

Jurisdiction	1989		1990	
	Cases	Rate per 100,000	Cases	Rate per 100,000
Allegany	0	0.0	1	1.3
Anne Arundel	15	3.5	27	6.3
Baltimore	21	3.1	39	5.6
Calvert	9	18.4	71	3.6
Caroline	2	8.1	3	11.1
Cecil	7	10.0	15	21.0
Charles	14	14.0	23	22.7
Dorchester	3	10.0	1	3.3
Frederick	3	2.1	3	2.0
Garrett	0	0.0	0	0.0
Harford	4	2.4	27	14.8
Howard	3	1.7	10	5.3
Kent	11	64.7	9	50.4
Montgomery	15	2.1	13	1.7
Prince George's	8	1.1	10	1.4
Queen Anne's	11	33.0	10	29.5
St. Mary's	3	4.2	5	6.6
Somerset	0	0.0	0	0.0
Talbot	2	6.9	1	3.3
Washington	1	0.9	3	2.5
Wicomico	2	2.7	6	8.1
Worcester	2	2.7	6	8.1
Baltimore City	6	0.8	12	1.6
Maryland Total	143	3.1	238	5.0

Eighty-four percent of the cases had onset of illness in May through September; the peak incidence was in June (67 cases) and July (60) (Figure 9).

The male to female ratio was 1.1:1.0; 206 (85.1%) were white, 13 (5.4%) black, 3 (1.2%) other race, and the race of 20 (8.3%) was not known. Ages ranged from 1 to 83 years (median 30 years). The highest age-specific incidence rates per 100,000 were noted in males, 5-9 years old (12.9), 10 to 14 years old (8.8), and 50 to 59 years old (8.7), and females, 60 to 69 (9.0).

Information about symptoms was available in over 95% of the cases. Of these, 179 (75.5%) had erythema

**Figure 9**

migrans, 62 (26%) had arthritis and 88 (37.9%) had arthralgia. Neurological symptoms were present in 22 cases (9.4%): Bell's palsy in 10, carpal tunnel syndrome in 5, meningitis in 1, and miscellaneous neuropathies in the remainder. Cardiac symptoms were uncommon, only occurring in 6 patients (2.6%): 5 had palpitations and one had an unspecified EKG abnormality.

Less than 10% of the patients required hospitalization. Definite tick bite prior to onset of illness was reported by 93 of 230 (40.4%) responding to the question. In most cases, the county where exposure was reported to have occurred was the same as the county of residence.

## MALARIA (57)

**1.2/100,000 (U.S. 0.5/100,000)**

The number of cases by county is shown in Table 1 (see July, 1991 issue). Montgomery and Prince George's counties reported 78.9% of all cases in 1990. Ages of patients ranged from 2 to 85 years (median 32 years); almost 65% were 20 through 45 years of age. Twenty-eight were black, 10 Asian, 6 Hispanic, 5 white, and 8 were of unknown race. The male to female ratio was 1.8:1.0. Of those with known status (34 individuals), 28 (82.4%) were refugees or recent immigrants to the U.S.

The type of malaria was as follows: *Plasmodium falciparum* (22), *P. vivax* (13), *P. ovale* (2), *P. malariae* (2), and unspecified (18). Malaria was acquired in Africa (33 cases, including 18 in Nigeria), Asia (10, including 7 in India and Vietnam) and Central (5) and South (1) America; the country of exposure for 8 patients was not specified. In general, *P. falciparum* malaria was contracted most often in Africa (19 cases) and *P. vivax* malaria in Asia and Central America. No data on chloroquine resistance of *P. falciparum* were available.

**To be concluded in September, 1991.**

**IF YOU EVER  
SHOT DRUGS GET  
TESTED BEFORE  
YOU GET PREGNANT.**

**DON'T MAKE THEM  
THE AIDS GENERATION.**

Almost all babies with AIDS have mommas who shoot up or who sleep with men who have shot up. Babies with AIDS can't live very long.

If you or your partner ever shot drugs, even if it was only once, you probably shared needles or works.

Many drug users have gotten AIDS that way and passed it on to their babies.

If you want a baby, you and your sex partner should have the AIDS test first, before you get pregnant. Until then, help protect yourself and your partner from AIDS by using condoms.

Protect your baby. Get into treatment. The sooner you stop shooting drugs the safer you and your baby will be.

**STOP SHOOTING UP AIDS.**  
GET INTO DRUG TREATMENT.

## *1991 Semiannual Meeting*

---

Mark your calendars! Med Chi's Semiannual Meeting will be held September 13, 14 and 15 at the Carousel Hotel and Resort in Ocean City, Maryland. In addition to continuing medical education credits and exhibitors, attendees will have an opportunity to express their opinions during discussions on policies governing the future of medicine including:

- Radiation technologist regulations,
- Mammography screening, and
- AIDS and HIV testing of physicians.

The Med Chi Council will convene on Friday, September 13, 1991 at 3:00 pm. The House of Delegates will meet on Saturday, September 14, 1991 at 1:00 pm.

U.S. Surgeon General Antonia Novella MD and AMA Trustee Robert McAfee MD are featured guest speakers. Families wishing to visit Ocean City are strongly encouraged to attend this year's meeting which will feature special events and activities for spouses and children.

For hotel reservations, call 1-800-641-0011. For registration and meeting information, call 1-301-539-0872 or 1-800-492-1056. For registration forms, see the "Meet at the Beach" ad on page 642 of this *MMJ*.

---

## *Medical Assistance Provider Fee Project Update*

---

Med Chi has received many inquiries about the Maryland Medical Assistance Program's new Provider Fee Project (PFP). A letter explaining this project was mailed in July to physicians participating in the Medical Assistance Program. On June 13, 1991, Med Chi's Executive Committee met with Nelson Sabatini, Secretary to the Department of Health and Mental Hygiene (DHMH), who indicated he would be willing to appear before any component medical society to present information about the PFP and to answer questions from physicians about this project. If you are interested in such a meeting, please contact Roseanne M. Matricciani, Assistant Executive Director for Healthcare Policy, at 301-539-0872 or 1-800-492-1056.

The Executive Committee also helped resolve two critical issues pertaining to this project. The first issue concerned the new PFP billing form received by physicians. Many physicians complained that the form was confusing and their billing clerks/accountants could not discern the amount of money to be posted to each patient's record. During the Executive Committee meeting, Mr. Sabatini assured Med Chi that the billing form would be clarified to ease financial recordkeeping.

The second issue dealt with the reporting of the increase in allowable income on a physician's 1099 report of income caused by the PFP. Many physicians are concerned that reporting this increase would be inappropriate because they do not actually receive the increase in allowable income under the PFP. Med Chi's Executive Committee related this concern to Mr. Sabatini who stated he would seek a ruling from the Internal Revenue Service.

If you have other concerns about the PFP which you would like Med Chi to address, contact Roseanne M. Matricciani, Assistant Executive Director for Healthcare Policy, at 301-539-0872 or 1-800-492-1056.

---

## *Protocol for Physicians with HIV*

---

Med Chi physicians wishing to comment on a practice protocol for physicians with HIV may attend the next meeting of the Committee on AIDS to be held Tuesday, August 6, 1991 at 4:30 pm in the Med Chi Faculty Building. If you are interested in attending this meeting, contact Betsy Newman, Public Relations Director, at 301-539-0872 or 1-800-492-1056.

---

## Medicare Historical Payments

---

In a continued effort to improve communication with physicians regarding the new Medicare regulations, Maurice Hartman, Regional Administrator for the Health Care Financing Administration (HCFA), has developed the following:

### *Transition to the Physician Fee Schedule*

When the ball drops in Times Square announcing 1992, a new system for reimbursing physicians for their care of Medicare patients will go into effect. A Medicare fee schedule will be established and the same payment amount will be made for the same procedure to each physician billing in the same geographic locality. A doctor's specialty will not impact on the amount of reimbursement.

However, while the fee schedule amounts will be uniform for each procedure, Congress required that the fee schedule be phased-in over several years to lessen the immediate impact on some physicians. This phase-in is required in situations where there are significant variations between what is currently being paid for a procedure, what is known as the historical payment, and what would be paid under the fee schedule.

In situations where the historical payment varies from the fee schedule amount by at least 15 percent, either above or below, a blended payment will be made in 1992 and an updated blended payment will be made thereafter. If it varies by less than 15 percent, then the fee schedule amount will be paid.

Some examples may help illustrate this situation:

- (a) The historical payment in a locality for procedure 99999 is \$80. The Medicare fee schedule amount is \$100. Since the difference is 20 percent, a blended payment amount will be used in 1992. The payment would be the sum of the historical payment (\$80) plus 15 percent of the fee schedule amount ( $\$100 \times 15$  percent or \$15). Thus, the payment amount for that procedure in 1992 would be \$95 ( $\$80 + \$15$ ).
- (b) In another locality, the historical payment for procedure 99999 is \$90. Since the Medicare fee schedule amount is \$100, the difference is less than 15 percent. Therefore, in that locality the fee schedule amount of \$100 will be paid for services performed on or after January 1, 1992.

The historical payment is a calculation that represents the average allowed amount in a locality for each procedure. Obviously, the calculation of this amount is critical to the implementation of the physician fee schedule and the determination of whether a transition payment will be made for a given procedure. Your Medicare carrier will be making this calculation this summer and using it as a comparison this fall when HCFA publishes the final fee schedule relative value units and conversion factor in October. Each individual physician will be notified in late November of the payment rates for pertinent procedures which will go into effect in 1992.

---

## Licensure Renewal and Continuing Medical Education Credits

---

The Board of Physician Quality Assurance (BPQA) mailed out licensure renewal forms on or about June 30, 1991 for physicians with last names beginning M-Z. The packets included the standard Part A and a new Part B. Both forms are to be completed and returned to the BPQA by September 30, 1991.

The Maryland Office of the Attorney General recently sent a letter to Med Chi outlining the following options for physicians who submit licensure renewal applications with insufficient continuing medical education (CME) credits:

1. The physician can withdraw the application and resubmit before September 30, 1991, after completing the necessary continuing education courses; or
2. The physician can apply for a waiver of CME credits. However, the BPQA only grants waivers in cases of extreme hardship. In conformity with H.O. § 14-316, extreme hardship is found only in those cases where the enforcement of CME requirements "would so reduce the number of physicians in a community as to jeopardize the availability of adequate medical care in

that community." To request a waiver, the physician must submit a detailed written explanation as to how failure to renew the license would cause hardship to the community; or

3. The physician can apply for an inactive license under H.O. § 14-320. The application for inactive status must be received by September 30, 1991. Under inactive status, the physician CANNOT PRACTICE MEDICINE AND CANNOT PRESCRIBE. When the physician has enough CME credits, the physician can apply for reinstatement of his/her license; or
4. The physician can simply let the license lapse by not submitting an application. The physician can then apply for late renewal or reinstatement by submitting the requisite amounts of CME, depending on how much time has elapsed; or
5. The physician can accept a public order whereby his/her license is suspended and the suspension stayed, effective on October 1, 1991, for ninety days while the physician completes the CME credits. During this time the physician can practice medicine.

For questions regarding options for physicians with insufficient CME credits to request for licensure, contact the BPQA at 301-764-4777.

---

## 1991 AMA Annual Meeting

---

A resolution submitted by the Maryland Delegation to the American Medical Association (AMA) was passed during the AMA Annual Meeting held June 23-27, 1991 in Chicago. The resolution calls for the AMA to honor the contributions made by women serving in the U.S. military by supporting the Vietnam Women's Memorial Project, Inc. This project will lead to the establishment of a Vietnam women's memorial near the site of the Vietnam Veteran's Memorial in Washington, DC.

---

## Conference on Addiction and Physician Health

---

Med Chi's Second Annual Conference on Addiction and Physician Health will be held on Saturday, November 16, 1991 in the Med Chi Faculty Building. Sponsored by the Committee on Physician Rehabilitation and the Committee on Alcoholism and Chemical Dependency, the conference is designed to help health care professionals recognize and treat patients impaired by drugs or alcohol. Slated to fulfill 11 continuing medical education credits, the preliminary program is as follows:

### Preliminary Schedule

8:00 am - 8:45 am	Registration/Check-in
8:45 am - 9:00 am	Conference Overview
9:00 am - 10:00 am	The Role of the Primary Care Physician in the Treatment of Chemical Dependence Dan H. McDougal MD, Med Chi Committee on Physician Rehabilitation
10:00 am - 11:00 am	Assessment and Treatment of Alcoholism in Different Age Groups Franklin T. Evans MD, Chairperson, Med Chi Committee on Alcoholism and Chemical Dependency
11:00 am - 11:15 am	Break
11:15 am - 12:30 pm	Session A: Sexual Exploitation of Patients: Evaluation and Treatment of Sexual Addiction Richard Irons MD, Coordinator, Professional Assessment Program, Golden Valley Treatment Center  Session B: Assessment of Adolescent Chemical Dependency Rev. Edward Reading MDiv, NCAC - II, Assistant Director, Physicians' Health Program, Medical Society of New Jersey

	Session C: Primary Prevention of Impairment in Medical Students Susan Kalia MD, Director, University Health Services, The Johns Hopkins University
12:30 pm - 1:30 pm	Lunch
1:30 pm - 2:30 pm	The Impaired Physician David Canavan MD, Medical Director, New Jersey Physician Health Program
2:30 pm - 3:30 pm	Session A: Drug Testing for Physicians and other Health Providers Stanley R. Platman MD, Vice President for Medical Affairs and Chief of Department of Psychiatry, Addictions and Behavioral Medicine, Homewood Hospital Center, an Affiliate Hospital of the The Hopkins Health System; Chairperson, Med Chi Committee on Physician Rehabilitation
	Session B: The HIV Positive Physician Speaker to be announced
	Session C: Utilizing a Traditional Addiction Treatment Approach in the Treatment of Eating Disorders Townsend Pennington MD, Medical Director, Willough Treatment Center
3:30 pm - 3:45 pm	Break
3:45 pm - 5:45 pm	How to Help Your Patients Stop Smoking Carmine M. Valente PhD, Med Chi Deputy Executive Director and Kevin Scott Ferentz MD, Asst. Prof., Dept. of Family Medicine, University of Maryland School of Medicine

---

## *Doctor/Lawyer/ Teacher Partnership Against Drugs*

---

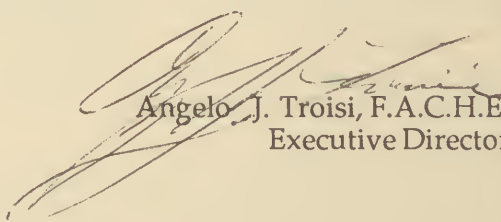

With the new school year just around the corner, Med Chi is seeking physicians who are willing to share their medical expertise and help prevent students from using drugs and alcohol. To volunteer, or for more information about the Doctor/Lawyer/Teacher Partnership Against Drugs, contact Betsy Newman, Med Chi Public Relations Director, at 301-539-0872 or 1-800-492-1056.

---

## *Med Chi Handbook and Bylaws*

---

Copies of the Med Chi *Handbook* for 1991-1992 and the May 1991 edition of the *Bylaws* are now available to all members. The *Handbook* provides a listing of all Med Chi officers, delegates, councilors, and committee members, as well as listings of component medical societies. The *Bylaws* are a guide to the Faculty administration. Members can request a **free** copy of either publication by calling Med Chi's Communications Department at 301-539-0872 or 1-800-492-1056. Non-members may purchase copies of the *Handbook* for \$21.00 and the *Bylaws* for \$10.00.

  
Angelo J. Troisi, F.A.C.H.E.  
Executive Director

# **We pay attention to every detail.**

With today's advanced medical technology, we're able to produce diagnostic images of remarkable complexity, clarity and detail. Which is why our head and body MRI imaging services are so valuable to you and your patients.

Magnetic Imaging of Baltimore's (MIB) dedicated radiologists and staff provide your patients with the care and experience you expect. We are able to schedule your patients within 24 hours of their request at our convenient location on the campus of Greater Baltimore Medical Center.

At Magnetic Imaging of Baltimore, we realize what a difference the details can make. So take a closer look. You might discover something your patients should know about.

# ***The Personality Disorder Treatment Program of Sheppard Pratt Hospital***

Very often, specialized inpatient evaluation and treatment is a critical step in the effective care of a borderline patient.

The Personality Disorder Treatment Program at Sheppard Pratt offers a combination of services that may help to untangle difficult clinical questions and facilitate your patient's continued outpatient treatment.

We offer:

- ☐ Short-term and intermediate-term specialized inpatient treatment
- ☐ Extended-term intensive inpatient treatment
- ☐ Comprehensive diagnostic evaluation
- ☐ Psychotherapy and psychopharmacology consultation
- ☐ Intensive individual and group psychotherapy provided by our staff of psychiatrists and psychologists
- ☐ Long-term treatment planning

If you would like to know more about the Sheppard Pratt approach to the borderline patient and other patients with severe personality disorders, contact the Adult Admissions Office at:

(301) 938-3800  
6501 North Charles Street  
Baltimore, Maryland 21285-5815

▪ ***Sheppard Pratt***

### Legal and Ethical Concerns of Your Medical Practice

*This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation, and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the State. The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIII, Section I). For more information, please refer to the Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland.*

### DEMPAQ: Development and Evaluation of Methods to Promote Ambulatory Care Quality

The Federal Health Standards and Quality Bureau (HSQB) was given a legislative mandate to conduct, through the Peer Review Organization (PRO) program, a pilot project to review care provided to Medicare beneficiaries in physicians' offices. As a result of this mandate, the Delmarva Foundation for Medical Care, Inc. (DFMC) was awarded \$3,000,000 in federal funding from the Health Care Financing Administration (HCFA) for its unsolicited proposal to develop and evaluate methods for reviewing the *quality of care* provided to Medicare beneficiaries in physicians' offices. DFMC serves as the Peer Review Organization (PRO) for Medicare beneficiaries in Maryland and the District of Columbia.

The title of this pilot project is DEMPAQ (Development and Evaluation of Methods to Promote Ambulatory Care Quality). It is a collaborative effort which will include the following team of researchers: R. Heather Palmer MB, BCh, SM - Harvard School of Public Health; Deborah Garnick ScD - Harvard School of Public Health; Jinnet Fowles PhD - Park Nicollet Medical Foundation; and Jonathan Weiner DrPH - The Johns Hopkins School of Hygiene and Public Health. Two other PROs will also be involved in the project: The Iowa Foundation for Medical Care (IFMC) and the Alabama Quality Assurance Foundation. DFMC, however, will be the prime contractor and will manage the contract.

The goal of the DEMPAQ project is "to develop, implement, and review methodologies that could be used for mandatory office-based review of care received by Medicare beneficiaries and to derive recommendations for full-scale implementation of such a review system within the PRO program."<sup>1</sup> The project will address problems concerning quality of care and those associated with underutilization and overutilization of services.

The review methods used in the project will be *claims profiling* and *medical record review*. "Medicare Part B claims data from the Common Working File will be used to generate computerized profiles of quality and utilization

indicators."<sup>2</sup> (The Common Working File is a Social Security file maintained by the carrier. When a claim is being processed, the carrier queries the file for eligibility information. Once the claim is approved, the carrier updates the file with the most current information concerning the beneficiary.) The profile format will be critiqued by physician consultants prior to sharing the data with profiled physicians. "In order to establish a physician profile, Medicare beneficiaries will be associated with the primary care physician who provides most of the office care for the patient."<sup>3</sup>

Two types of claims profiles will be used: *generic profiles* and focused, *condition-specific profiles*. Generic profiling may include hospitalization, visits to the primary care physician, visits to other physicians, use of ancillary services, and types of visits. Condition-specific profiles may look at a particular diagnosis in relation to visits and testing. Individual physicians will receive their own profiles along with comparison information and will be asked to critique the profiles for relevance and usefulness in relation to the quality of care. The profiles being developed relate to quality assessment and are not to be confused with the profiles (Comparative Performance Reports) developed by HCFA relating to physician payment.

The medical record review portion of the project will examine office-based medical records. The record documentation assessment (RDA) portion will look at six criteria: date of visit, patient complaint or reason for visit, observations regarding the patient, conclusions or diagnosis, plan for patient care or evaluation, and identification of clinician. The clinical performance assessment (CPA) portion will review clinical functions such as: drug prescribing, test ordering, the following of management plans, procedure performance, patient complaint workups, the making of diagnoses, and the provision of prevention/screening.

Physician volunteers will be asked to participate in the medical records review process. General practitioners, family practitioners, and internists will be selected randomly

from a list of doctors who submitted bills to Medicare between July 1, 1989 and June 30, 1990. Each physician volunteer will be requested to provide approximately twenty-five patient records selected randomly from among the patients for whom the physician provided care. The physician participants will be asked to submit records for a two-year period from July 1, 1989 through June 30, 1991. Approximately one hundred physicians from Maryland will be asked to participate in this project.

Physician volunteers who participate in the medical records review will be reimbursed five dollars per chart to cover copying expenses. If the physician does not have copy capabilities, DFMC will go to the physician's office with a portable copier and copy the medical records. "All information submitted will be strictly confidential. No physician or patient-specific information will be released by the project staff, except to the physician in question for educational purposes."<sup>2</sup>

The results of the data collection will be given to HCFA, the Congress who commissioned the project, medical organization liaisons, and participating volunteer physicians. All data, except for the confidential results given to participating volunteer physicians, will be in aggregate form only.

### Physician Consultants

The Medical and Chirurgical Faculty of Maryland (Med Chi) was invited to appoint a physician representative to the DEMPAQ project who would act as a physician consultant. The physician consultant will review a series of technical supplements including draft versions of the Record Review and Claims Profiling criteria. S(he) will provide specific critical comments representative of typical viewpoints of his/her colleagues so that these views can be incorporated into the review instrument.

Med Chi has appointed Robert Ruderman MD, Chairperson of the Faculty's PRO Monitoring Committee, to act as consultant to the DEMPAQ project. Med Chi has requested that Dr. Ruderman provide input into the design, interpretation, and review portion of the project.

### DEMPAQ Meetings

The Maryland Society of Internal Medicine (MSIM) hosted two meetings on November 27, 1990 and February 5, 1991 with DFMC and R. Heather Palmer MB, BCh, SM, Chief Researcher for the DEMPAQ project. Med Chi representatives were invited to these meetings as well as representatives from the American Society of Internal Medicine and the Maryland Academy of Family Practitioners, and the American College of Physicians' (ACP) Governor for Maryland.

Some concerns expressed by physician representatives at the first MSIM meeting on November 27, 1990 were:

1. Studies with a similar focus have been conducted by physicians but HCFA has not been interested in these studies.
2. It is difficult to look at charts from both the standpoint of utilization and acceptable care at the same time and with the same guidelines.
3. A physician must justify every decision s(he) makes in this type of study.
4. Whereas hospital review focuses on the primary diagnosis, physicians in an office setting deliver care to elderly patients who have a variety of complications and problems.
5. Quality of care is difficult to determine from chart review.
6. Physicians are being asked to participate in a study in which HCFA may use the results in a negative manner.
7. Physicians do not trust DFMC's involvement with the research because past experiences have shown DFMC to be insensitive to physician concerns.
8. Many physicians are convinced that the goal of this project is to reduce reimbursement for services and not to increase quality of care.

At the second meeting with DFMC and Dr. Palmer on February 5, 1991, physician representatives emphasized the need to inform physicians that their participation in this project was strictly *voluntary*. Furthermore, the physicians stressed the importance of having reviewers who were familiar with the entire system. A suggestion was made to provide medical groups with the opportunity to review charts determined to be outliers. Concern was also expressed over further modifying the HCFA 1500 form.

Med Chi is committed to keeping the viewpoints and opinions of Maryland physicians before the researchers and DFMC. Therefore, Med Chi representatives will continue to meet with Dr. Palmer and DFMC in the future.

### Report to Council

In a report presented to Med Chi's Council on March 21, 1991, the PRO Monitoring Committee gave a detailed analysis in which it was concluded that the DEMPAQ study had many defects which could be classified as defects of design/intent and defects of credibility. Criticism was directed at the choice of the fiscal intermediary chosen to retrieve the data for the claims profile review, thus opening the study not only to technical errors, but also eliminating a huge segment of practicing physicians in the Washington DC metropolitan area from the study.

Although confidentiality rules apply to PRO reviews, the

Committee felt that there should be no such secrecy involved in a pilot study having such a potential impact on physicians' practices. The credentials of those analyzing the study should be revealed.

It has also been alleged that the project's main intent was to design a Uniform Ambulatory Encounter Form designed to modify the HCFA 1500 forms, and to develop "parameters of care" which, in essence, would mean complete governmental control of medical care and the practice of medicine.

The PRO Monitoring Committee's report to Council concluded that the DEMPAQ study results should be published in a reputable medical journal, such as the *Maryland Medical Journal*, so that the study could be critiqued and analyzed by practicing physicians before any attempt is made to promulgate federal regulations or further studies. Furthermore, Med Chi's PRO Monitoring Committee will be carefully monitoring the activities of the DEMPAQ project and updating the Faculty on the progress of the project.

### Conclusion

While physicians welcome research efforts that focus upon improving the quality of care, it is difficult to view projects funded by HCFA in a positive manner when the PRO is involved. The reason physicians view such an effort with skepticism stems from the fact that the PRO's main function concerns the management of costs and the regulation of physicians. It is understandable that a group, which views physicians critically with an eye on denying reimbursement, is not embraced with physician trust. Certainly physicians have the right to question the PRO's involvement and input in a project that further intrudes into the practice of medicine.

Although the DEMPAQ researchers seem genuinely interested in improving the care delivered in ambulatory settings, the participation of the PRO seems to verify that the whole purpose of this project is to regulate the cost of care delivered by physicians in their offices. The promulgation of such regulations would be highly disruptive to patient care and would further impinge upon the physician-patient relationship.

Whereas cost containment is a legitimate concern with regard to the delivery of health care, adding on another layer of administrative costs to the PRO and to HCFA does not appear to be the answer to that concern. In fact, a research project which should focus upon educating the physician population should not be tied to a special interest group that does not educate physicians but only sanctions them.

It is Med Chi's sincere hope that physician input into the DEMPAQ project will provide the researchers with valuable knowledge concerning medical practice. Toward this end, Med Chi will continue to inform the project collaborators of the concerns and issues vocalized by physicians in Maryland.

For your insulin-mixing  
or NPH-using patients

## Humulin<sup>70/30</sup> makes life easier

**Rapid onset and sustained  
duration insulin activity  
in a single vial**

- May offer enhanced control through a more physiologic activity profile
- Accurate dosing—eliminates mixing errors
- Convenient premixed dose for better compliance
- Easy to use—for patients who find mixing difficult

**Specify**  
**Humulin<sup>70/30</sup>**  
*70% human insulin  
isophane suspension  
30% human insulin injection  
(recombinant DNA origin)*

**Humulin has  
just the right mix**

Any change of insulin should be made cautiously and only under medical supervision.

Changes in refinement, purity, strength, brand (manufacturer), type (regular, NPH, Lente®, etc), species (beef, pork, beef-pork, human), and/or method of manufacture (recombinant DNA versus animal-source insulin) may result in the need for a change in dosage.

### Evaluation of Patients with Liver Tumors for Resectability

Several factors must be considered in the preoperative evaluation of the patient being considered for liver surgery. These include the nature of the lesion and its symptoms, the location of the lesion in relation to the inflow and outflow vessels, the condition of the rest of the liver, and the general condition of the patient.

Asymptomatic patients with simple cysts of the liver, cavernous hemangiomas, focal nodular hyperplasia, and liver cell adenoma should be followed for a period of time and operated on only if there is evidence of growth or if symptoms develop.

Since the late 1980s, most of the patients with acute pyogenic abscess of the liver are being treated, at least initially, by antibiotics and radiographically controlled catheter drainage rather than by operative drainage. On the other hand, hydatid cysts with viable parasites must be managed operatively, but not by resection. Sterilization of the cyst contents with hypertonic saline solution or silver nitrate followed by removal of the endocyst is easily done; this is as effective and much safer than resection.

Primary liver cancer occurring in the noncirrhotic liver should be resected if possible. This is particularly true for patients with fibrolamellar variant which is eminently curable. Primary liver tumors in cirrhotic patients should probably not be resected for several reasons. These include: (1) borderline hepatocellular function, which may decompensate after anesthesia and surgery; (2) inability of the liver to regenerate; (3) possible multifocal origin of hepatocellular carcinomas in cirrhotic patients; (4) poor prognosis and dismal long-term survival rates in those patients with cirrhosis who have survived an operation for primary cancer.

Localized and limited metastatic colorectal cancer and soft tissue sarcoma should be resected if there is no evidence of metastasis outside the liver. Liver resection for metastasis for most other common cancers has not been proven to be of any benefit. Palliative resection of metastatic tumors (i.e., debulking, leaving known residual disease in the liver or elsewhere) should not be done. A possible exception to this rule is justified in patients with very slow growing tumors (e.g., metastatic carcinoid tumors to the liver) for whom the size of the tumor or its hormonal production has made life unbearable and for whom there is no other effective therapy.

The nature of a liver lesion can usually be determined preoperatively by the use of selective laboratory tests and imaging. A careful history and physical examination may raise suspicion of abscess, hydatid cyst, or primary or secondary liver cancers. Elevation in the blood levels of alpha-fetoprotein, carcinoembryonic antigen, or echinococcal

serologic tests suggest a specific diagnosis. Focal nodular hyperplasia, and liver cell adenoma must be considered in young women.

Ultrasonography is effective in distinguishing cystic from solid masses and is quite useful in determining the proximity to or involvement of major vessels, especially if used intraoperatively. Computed tomography (CT) is more effective in determining the size and number of lesions. Magnetic resonance imaging (MRI) may be utilized for more detail in some cases, but it *should not* replace CT scanning for two reasons: (1) It is more expensive and may not add any more information than the CT and (2) CT scans give better imaging of the retroperitoneal space and the status of the lymph nodes. However, MRI can be used after CT, based on the radiologist's request, to evaluate an infiltrative process in the liver or to help in the diagnosis of cavernous angiomas of the liver. Nucleotide scan with tagged red blood cells can be helpful in the diagnosis of cavernous hemangiomas. Angiography currently plays a less important role in making the diagnosis of liver tumor. However, it remains essential for preoperative evaluation to provide a road map of the feeding arteries and veins of the liver. Recently, CT-angiography has been very valuable in preoperative evaluation of lesions in the liver, their proximity to vessels, and the architecture of the blood supply to the liver.

Needle biopsy is not effective with cystic lesions and even dangerous in patients with hydatid cysts, hemangiomas, and some hypervascular tumors. Needle aspiration for cytologic diagnosis may be useful for the diagnosis of some primary or metastatic cancers, but it will not be adequate for the diagnosis of most benign tumors. When doubt persists about the nature of the lesion, open wedge biopsy will be needed. It is the clinician's responsibility to rule out the presence of curable cancer, either by establishing another diagnosis or by demonstrating unresectability.

The resectability of an isolated liver lesion is determined by its proximity to the structures in the liver hilum and to the inferior vena cava, keeping in mind the necessity of securing a margin of normal liver tissue. Hemangiomas and adenomas do not invade adjacent vessels and, therefore, can be enucleated even if they are distorting major veins. Direct invasion of major vessels is characteristic of hepatomas and usually precludes curative resection. It is highly recommended that a 1 cm margin of resection be obtained at the time of resection. Resectability can thus be defined as the ability to remove a lesion without compromising the inflow and outflow vessels and ducts to a residual healthy liver that can sustain life. Implicit in this definition is the functional

status of the liver parenchyma uninvolved by the disease. Hyperbilirubinemia is a grave prognostic sign. In addition to adequate liver function, safe major liver resection can be done only in patients with intact hemostasis and a cardiovascular system capable of tolerating some hemodynamic instability. Coagulopathies, particularly those with diminished platelet function, should preclude elective resections. In spite of the most meticulous technique, innumerable small vessels will be transected without surgical control, and the outcome will depend on the patient's ability to provide hemostasis.

## A Clinical Moment With ... Diabetes

### Diabetes Education

*Doctor, When I was diagnosed as having insulin dependent diabetes two weeks ago, I spent three days in the hospital before being sent home. While there, I had a crash course in self-monitoring of blood glucose, insulin administration, and meal planning. One month ago I was well. Now I have diabetes which places many restrictions on my lifestyle that I do not understand. I want to control my diabetes as well as possible and prevent complications, but I need help.*

This is a typical situation for an acute onset insulin-dependent diabetic patient in the current system of diabetes management. Because of hospital utilization rules, hospital stays are not long enough for patients to obtain complete training in the care of their problem. Emergency issues (blood glucose testing, insulin administration techniques, and beginning diet instruction) are taught in a crash course fashion. The patient is then discharged to an outpatient program for further instruction and management. Administratively, a brief hospital stay is mandated in order to save funds for the insurance programs, but practically, it is also good for the patient since the final stage of diabetes regulation should be done in a normal living situation. Unfortunately, diabetes instruction ceases for many patients on discharge from the hospital.

In Maryland, there are approximately one hundred instructors qualified as Certified Diabetes Educators (CDEs) who are distributed fairly evenly throughout the State. CDEs are available to help physicians and patients with the next stage of diabetes management -- Education. A good diabetes education program consists of forty hours of training, of which four to six hours should be meal planning and evaluation of packaged food labels. Other segments cover foot care, exercise, hypoglycemia and hyperglycemia manage-

ment, management of other complications of diabetes, traveling, eating out, insurance, purchasing of supplies, pregnancy, and emotional aspects of long-term illness. Group programs are usually more effective than individual instruction because of the interaction of the attendees. Diabetic patients should attend an update or refresher program of four to six hours duration on an annual basis. If a patient participates in adequate diabetes training programs, the initial stay in the hospital should be the only admission for diabetes in his or her lifetime except for pregnancies, surgeries, or other special situations.

CDEs and diabetes education programs may be contacted through a hospital or the local branch of the American Diabetes Association. It is the physician's responsibility to recommend a diabetes education program in which s(he) has confidence and with which s(he) has regular contact. At the completion of the program, the physician should receive an evaluation which includes suggestions as to any areas in which the patient may need training.

# Our Pictures Are Worth A Thousand Words.<sup>TM</sup>

## Case #16

A 56 year old female fell and immediately experienced posterior ankle and calf pain.  
**DIAGNOSIS: Torn Achilles tendon.**

The sagittal (A) and coronal (B) MR images demonstrate discontinuity (arrows) of the Achilles tendon with retraction and laxity of the musculotendinous junction as well as increased signal within the tendon.

MRI provides a comprehensive evaluation of the integrity of both the osseous structures and soft tissues of the traumatized painful ankle. With respect to Achilles tendon pathology, MRI permits the differentiation of partial tear, complete tear, tendonitis and

peritendinous retrocalcaneal bursitis. In the context of traumatic tears, MRI defines the site of injury relative to the calcaneus and musculotendinous junction and quantitates the degree of tendon retraction.

Figure C demonstrates a diffusely thickened but intact Achilles tendon in a patient with chronic tendonitis. A normal Achilles tendon is illustrated in Figure D. Also note the subchondral osteonecrosis in the talus (arrowhead).

At Drs. Copeland, Hyman & Shackman, P.A. we are proud of our high resolution, state-of-the-art imaging. We look forward to consulting with you on any diagnostic imaging procedure in order to best serve you and your patients in the most expeditious and economic manner.

We provide convenient evening and weekend hours at both MRI locations, double-readings for quality assurance, and FAX capabilities for delivering reports immediately.

**T**he meeting was called to order at 10 am on Wednesday, May 8, 1991 by the President, Reynaldo L. Lee-Llacer MD, at the University of Maryland, University College Center for Adult Education, College Park, Maryland.

## ■ County Flags

It was noted that the county banners representing the component societies would be on permanent display in Osler Hall. Dr. Lee-Llacer thanked those physicians who were instrumental in assisting in this project to obtain and display the colorful symbols of each of the twenty-four counties of the State.

## ■ Invocation

Leslie R. Miles, Jr. MD, Chairperson of the Committee on Medicine and Religion, delivered the invocation.

(l to r) George S. Malouf, Sr. MD, Ted Lewers MD, and J. David Nagel MD confer before a meeting of the House of Delegates.

## ■ Americana Slide Show

The AMA's videotape, "Americana," celebrating the history and accomplishments of the many people who make up our great country was shown as a patriotic salute to our common heritage.

## ■ Parris N. Glendenning

Parris N. Glendenning, the Prince George's County Executive presented a proclamation to Med Chi and opened the program by proclaiming the week of May 7 to 11 as "Doctors Week in Prince George's County." He went on to describe the close association the County has always had with the medical profession.

After his presentation, Mr. Glendenning was presented with a Certificate of Appreciation.

## ■ Visiting Dignitaries

Visiting dignitaries to this annual meeting were acknowledged as follows: Dr. John Tupper, President of the AMA; Dr. Alex Alexander, President of the American College of International Physicians; Dr. James Marvel, Delaware Medical Society; Dr. Gordon McCloud and his wife, Jane, from the Pennsylvania Medical Society; Dr. John Owen, Jr. and his wife, Wanda, from the Virginia Medical Society; Dr. William E. Ryan from the New Jersey Medical Society; and Dr. Michael Stump and his wife, Priscilla, from the West Virginia Medical Society.

■ **Laughlin Award for Citizenship**

Maryland's Lieutenant Governor Melvin ("Mickey") Steinberg was presented with the *Dr. Henry P. and Page Laughlin Award for Citizenship*. Following the presentation, Lt. Governor Steinberg spoke on the important role physicians have in the legislative process, as well as to the citizenry of Maryland.

■ **Minutes of the Previous Meeting**

The minutes of the September 15, 1991 Semiannual Meeting were approved.

■ **Necrology**

In the absence of the Secretary, Harold B. Bob MD, the President-elect, J. David Nagel MD, read the list of deceased members.

■ Memorial Resolutions

On motions of the Secretary, the following resolutions, read by J. David Nagel MD, President-elect, were adopted unanimously by the House, each on a separate division vote:

**ARIS T. ALLEN MD**  
1910-1991

Whereas, Delegate Aris T. Allen MD was born in San Antonio, Texas and his early education included both informal and formal training in a wide variety of disciplines from automobile mechanics to drafting. In 1936, Dr. Allen obtained a federal job in Washington DC which allowed him to work days and complete his high school and undergraduate education in the evenings.

Whereas, Dr. Allen graduated from the Howard University Medical School in 1944 with his medical degree. Since 1945, Dr. Allen practiced medicine in Annapolis, Maryland. As an active member of numerous civic, professional, and political organizations, Dr. Allen held positions of leadership and received many awards for his services.

Whereas, Dr. Allen is notable as being the first black physician to serve as an officer in the state medical society, the Medical and Chirurgical Faculty; to represent Anne Arundel County in the state legislature; to win nomination to statewide office in 1978 as the running mate of Republican gubernatorial candidate, J. Glenn Beall, Jr.; and to become Chief of Staff at the Anne Arundel General Hospital. Dr. Allen represented Anne Arundel County in the House of Delegates from 1967-1974 and in the Senate from 1979-1982. As a former state Republican Party chairperson, Dr. Allen returned to the legislature after an eight-year absence by winning election in November 1990 to his former seat in the 30th District.

Whereas, He will be remembered for his irrepressible wit, his indomitable spirit, as an inspiration to all who knew him, and his courage and humor are a legacy that will be cherished; and

Whereas, His death will leave a very real void in the lives of his family, friends, former patients, constituents, and colleagues, therefore, be it

*Resolved,* That this House of Delegates of the Medical and Chirurgical Faculty of Maryland on May 8, 1991 adopts this Resolution with an expression of profound sorrow on the death of Dr. Allen; and be it further

*Resolved,* That this resolution be spread upon the minutes of this meeting and a copy sent to his wife, Dr. Faye Watson Allen, in recognition of the high esteem in which Dr. Allen was held and will be remembered.

**J. RAYMOND GLADUE MD**  
1922 - 1990

Whereas, J. Raymond Gladue MD, a native of Woonsocket, Rhode Island, attended the University of Rhode Island and the University of New Hampshire. He served in the Army during World War II before completing his education at the University of Rochester Medical School in 1948. He served his internship and residency at Baltimore City Hospitals (now the Francis Scott Key Medical Center).

Whereas, He retired about two years ago after ten years as Assistant Medical Director at the Deaton Hospital and Medical Center and had been Medical Director of the Jenkins Memorial Home for about fifteen years. Earlier, Dr. Gladue had been a staff doctor for the Veterans Administration and maintained a private practice in Internal Medicine in Baltimore.

Whereas, He founded and served as president of the American Association of Nursing Home Physicians. He also served as a consultant to the Social Security Administration and held other governmental posts, as well as enjoying memberships in many professional and religious organizations.

Whereas, Dr. Gladue served with dedication as a member of the Baltimore City Medical Society and the Medical and Chirurgical Faculty of Maryland.

Whereas, He will be remembered for his irrepressible wit, his indomitable spirit, and as an inspiration to all who knew him, and his courage and humor are a legacy that will be cherished; and

Whereas, His death will leave a very real void in the lives of his family, friends, former patients, and colleagues, therefore; be it

*Resolved,* That this House of Delegates of the Medical and Chirurgical Faculty of Maryland on May 8, 1991 adopts this resolution with an expression of profound sorrow on the death of Dr. Gladue; and be it further

*Resolved,* That this resolution be spread upon the minutes of this meeting and a copy sent to his wife, Mrs. Dorothy Whittington Gladue, in recognition of the high esteem in which Dr. Gladue was held and will be remembered.

**JAMES PATRICK GALLAHER MD**  
1925 - 1991

Whereas, James P. Gallaher MD, born in St. Mary's, West Virginia in 1925, received his medical degree from the University of Maryland, interned at Reading Pennsylvania Hospital and served his residency in Obstetrics and Gynecology at University Hospital, Baltimore, Maryland; and

Whereas, He began his practice of Obstetrics and Gynecology in Salisbury in 1955; and

Whereas, Dr. Gallaher then served devotedly as a physician for his beloved patients, as a dependable colleague for his fellow professionals, and as a leader within the Medical Staff of Peninsula General Hospital Medical Center; and

Whereas, He served as President of the Wicomico County Medical Society in 1960 and remained an active member even though semi-retired from his private practice; and

Whereas, He was a Fellow of the American College of Surgeons and of the American College of Obstetrics and Gynecology; and

Whereas, He served with pride as a member of the Medical and Chirurgical Faculty of Maryland; and

Whereas, He will be long remembered for his incisive mind, his devotion to his friends and colleagues, his inspiration to many and particularly by the multitude of patients whose lives he touched and whose pain and joy he witnessed; and

Whereas, His untimely death has created a terrible void in the lives of his family, friends, former patients, and colleagues; and

Whereas, the Wicomico County Medical Society and the Medical and Chirurgical Faculty of Maryland express their sympathy to his family; therefore, be it

*Resolved*, That this House of Delegates of the Medical and Chirurgical Faculty of Maryland on May 8, 1991 adopts this resolution with an expression of profound sorrow on the death of Dr. Gallaher; and be it further

*Resolved*, That this Resolution be spread upon the minutes of the House of Delegates at its annual meeting, with a copy sent to his wife, Mrs. Sara Gallaher.

#### ■ Fifty-Year Members

Fifty-year certificates were presented to the following members:

##### —Baltimore City

<i>Max Baum MD</i>	<i>Herman H. Baylus MD</i>
<i>Herman K. Goldberg MD</i>	<i>C.E. Leach MD</i>
<i>Edward F. Lewison MD</i>	<i>Ephraim T. Lisansky MD</i>
<i>Joseph R. Myerowitz MD</i>	<i>Gilbert E. Rudman MD</i>
<i>Frederick Vollmer MD</i>	<i>Daniel G. Wehner MD</i>
<i>Gibson J. Wells MD</i>	

##### —Baltimore County

*Roger G. Windsor MD*

##### —Howard County

*Charles S. Whitaker MD*

##### —Wicomico County

*Marion H. Gillis MD*

Dr. Lee-Llacer asked for a round of applause for all who had attained the honor of fifty years of membership in the Medical and Chirurgical Faculty of Maryland. He indicated the fifty-year members would have their certificates mailed to them.

#### ■ AMA-ERF Checks

The American Medical Association-Education and Research Foundation (AMA-ERF) checks to the medical schools in Maryland were presented by Mrs. Lindhardt and Mrs. Figueroa, President of the Auxiliary.

A check for \$14,120 in unrestricted funds and a check for \$7,804 in restricted funds was presented to Dr. H. Frank Herling, Assistant Dean of Student Affairs, The Johns Hopkins University School of Medicine.

A check for \$1,755 in unrestricted funds and a check for \$2,514 in restricted funds was presented to Col. Robert Fechner on behalf of the Uniformed Services University of Health Sciences, Henry M. Jackson Foundation.

A check for \$22,164 in unrestricted funds and a check for \$8,350 in restricted funds was presented to Dr. Richard Richards, Acting Dean of the University of Maryland School of Medicine.

#### ■ Wyeth-Ayerst Laboratories Physician Award

The Wyeth-Ayerst Laboratories Physician Award for Community Service (formerly the A.H. Robins Award) was presented to Dr. Donald Theodore Lewers by Raymond Langston, the District Manager of the Eastern District of Wyeth-Ayerst. The Award is presented each year to a physician who has provided outstanding service to his or her community outside the field of medicine. Dr. Lewers has devoted countless hours to the preservation of wildlife and the environment on Maryland's Eastern Shore.

#### ■ Physician's Practice Digest

*Physician's Practice Digest*, a new quarterly magazine published by Med Chi focusing on administrative needs of physicians (as opposed to scientific matters, which will continue to be included in the *Maryland Medical Journal*), won a special award in the national competition for excellence in medical journalism sponsored by Sandoz Pharmaceuticals. The award was presented to the President, by Ms. Barbara Stern, a Sandoz Pharmaceuticals representative. Dr. Lee-Llacer thanked Ms. Stern for the beautiful award.

Members of the Auxiliary engage in conversation while waiting for a lecture to begin at the 1991 Annual Meeting at College Park, Maryland.

■ **Certificates of Recognition**

Dr. Lee-Llacer presented certificates of recognition to four Med Chi committee chairpersons for their outstanding service and dedication. Certificates were presented to Dr. Sidney B. Seidman, Chairperson of the Peer Review Committee; Dr. Stanley R. Platman MD, Chairperson of the Committee on Physician Rehabilitation; Dr. Fred C. Gill, Chairperson of the Committee on AIDS; and Dr. John Bartlett, Vice Chairperson of the Committee on AIDS.

■ **Doctor/Lawyer/Teacher Partnership Against Drugs**

A special certificate was presented to Dr. Hiroshi Nakazawa, Chairperson of the Public Relations Committee and Statewide Coordinator for the Doctor/Lawyer/Teacher Partnership Against Drugs program, by Dr. Lee-Llacer to thank him for his ongoing dedication to the endeavors of Med Chi.

Last year, under the leadership of Dr. Raymond Atkins, the Public Relations Committee initiated this program. Doctors and lawyers visit schools in their communities to talk with students about the medical and legal consequences of drug and alcohol use. To date, more than 345 classes have been visited and the program has been presented to over 10,380 students.

On behalf of the AMA, Dr. John Tupper, the President of the AMA, presented an award to Med Chi for its Doctor/Lawyer/Teacher Partnership Against Drugs Program. Accepting the award on behalf of Med Chi were Dr. Reynaldo Lee-Llacer; Dr. Raymond Atkins, Past President; Dr. Nakazawa; and Alan Rifkin of the Maryland Bar Association. Mr. Rifkin mentioned that he will turn the award over to Seymour Stern of the Maryland Bar Association who helped make this program successful.

The audience joined the President in a round of applause and appreciation for the combined efforts of literally dozens of physicians and lawyers who made this program a reality.

■ **11th Annual Photo Contest**

The Public Relations Committee sponsored Med Chi's 11th Annual Photo Contest. Faculty and Auxiliary members entered a total of thirty-three photos. The first place winner was David Paul MD and the second place winner was Michael Liteanu MD. The President presented the awards to the winners.

■ **Award for Excellence in Organized Medicine**

The Award for Excellence in Organized Medicine recognizes the contributions Maryland medical students make to organized medicine. The President presented two awards to two medical students: Elliot E. Casez from the University of Maryland School of Medicine and Martin J. Citardi from The Johns Hopkins School of Medicine.

■ **SeniorReach Partnership Award**

Senator Rosalie Abrams, Director, Maryland Office on Aging, presented a plaque to the Faculty highlighting its SeniorReach partnership on behalf of senior citizens of Maryland. The President accepted the award on behalf of Med Chi.

■ **Emeritus Membership**

Dr. Schneider, Chairperson of Council, moved to dispense with the reading of the list of emeritus members since the list was included on the agenda for the meeting. The motion was adopted.

On motion of Dr. Schneider, the following members, having received the recommendation of their component societies, were elected to emeritus membership:

— **Allegany County**

*Thomas D. Graff MD*

— **Anne Arundel County**

*Harvey R. Butt, Jr. MD*

*Jose Angel Palancar MD*

*Hewitt I. Varney MD*

— **Baltimore City**

*Daniel Bakal MD*

*Joseph R. Cowen MD*

*William A. Dear, Jr. MD*

*Francis M. Dugan MD*

*Earl P. Galleher, Jr. MD*

*Charles M. Henderson MD*

*James E. T. Hopkins MD*

*Nathan B. Hyman MD*

*Edward J. Kowalewski MD*

*Albert C. Montague MD*

*Alfred G. Ossman, Jr. MD*

*Homayoon Taavon MD*

*M. Lee Williams MD*

— **Baltimore County**

*John E. Carroll, Jr. MD*

*Donald S. Carter MD*

—Affiliate Members

*William B. Long, Jr. MD      George M. Simons MD*

■ Report of Council

Dr. Schneider, Chairperson of Council, summarized subjects addressed by the Executive Committee and Council during the 1990-91 operational year. Action was taken on more than sixty committee meeting minutes and reports. Med Chi, in coordination with the entire medical community, was able to either assist in passing favorable legislation or defeating undesirable legislation affecting public health, medical practice, and health care financing issues. Dr. Schneider mentioned that a full report highlighting Council and Executive Committee actions during the year would be available at the Friday House of Delegates meeting.

Some of the subjects mentioned by Dr. Schneider were: Health Access America, Medicaid and the Open Enrollment Program, No-Fault Insurance, Hospital Medical Bylaws and the Springfield Hospital Center issue, PRO Monitoring, Proper Referral of AIDS Patients, and Review of Healthcare Credentials Verification, Inc. application forms.

■ Treasurer's Report

Dr. Jose M. Yosuco, Treasurer, gave his report. He noted that a budget was attached to the agenda. No vote is required as the budget is presented for information only in accordance with instructions from the House of Delegates.

The auditor's statement for 1990 was accepted.

■ Board of Physician Quality Assurance

Dr. Ira Brecher, a member of the Board of Physician Quality Assurance (BPQA), reported on the activities of the BPQA and stated that the number of outstanding cases has dwindled.

■ Maryland Medical Political Action Committee

Dr. Fred Hatem reported that the Maryland Medical Political Action Committee (MMPAC) enjoyed a high level of success and influence last year and thanked Dr. Harold Bob for his help with the Committee. Dr. Hatem noted that 96 percent of the candidates supported by MMPAC won their races in the Maryland legislature. He mentioned that candidate support is central to MMPAC's existence and that political education is also important; both require funding. Dr. Hatem went on to state that only one-third of the House members are dues paying members at this time and asked that everyone join today. He also said he would be present on Friday to accept their \$100 dues.

■ Bylaws Committee

The President advised the members of the House that the "Consent Calendar" procedure would be used for the report of the Bylaws Committee. Following a review of the issues of the report by Kevin N. Hennessey MD, Chairperson of the Bylaws Committee, Items 3, 5 and 8 were extracted for discussion.

After discussion, it was decided to adopt Items 3 and 5. Item 8 was remanded back to the Bylaws Committee for further study.

Dr. Hennessey, on behalf of the Bylaws Committee, moved adoption of Bylaw amendments, Items 1, 2, 4, 6, and 7 of the report. These items were adopted as presented.

■ 1. Proposed Bylaw Amendment to the Med Chi Insurance Fund, Article X, Section 1 - ADOPTED

*Rationale* – To clarify verbiage in the bylaws.

*Amend Article X, Section 1*, as follows – [ ] indicate deletion; CAPS indicate change.

Section 1. – There shall be a Med Chi Insurance Fund composed of seven Directors and it shall have the powers and duties provided from time to time by the [Articles of Incorporation] MED CHI INSURANCE FUND BYLAWS and any amendments thereto.

■ 2. Proposed Bylaw Amendment to Finance Committee, Article X, Section 10 - ADOPTED

*Rationale* – To increase the size of the committee from five to seven members.

*Amend Article X, Section 11*, as follows – [ ] indicate deletion; CAPS indicate change.

Section 11. – A Finance Committee to advise and counsel the Treasurer regarding the Faculty's financial and investment program shall be [composed] COMPRISED of the Treasurer and [four] SIX other members, [one] TWO of whom shall be appointed by the President each year for a [four] THREE-year term. The President shall annually designate the Chairman of the committee.

■ **4. Proposed Bylaw Amendment to the PRO Monitoring Committee, Article XI, Section 29 - ADOPTED**

*Rationale* – To more accurately reflect the activities of the PRO Monitoring Committee by adding verbiage to allow the PRO Monitoring Committee to respond in a timely manner to inappropriate actions taken by the PRO (which has the contract with HCFA for the Maryland area) against physicians.

*Amend Article XI, Section 29, as follows* – [ ] indicate deletion; CAPS indicate change.

Section 29. – The PRO Monitoring Committee shall be appointed by the President. The President shall designate the Chairman. All members shall be chosen for their knowledge, experience, and interest in the activities of the Professional Review Organizations. The committee shall act as an analytical group to review the effect of programs carried out by the appropriate designated organization which has the contract with respect to the cost and quality of medical care. **THE COMMITTEE SHALL BE RESPONSIBLE FOR COMMUNICATING DIRECTLY WITH THE PRO IN INSTANCES WHERE THE COMMITTEE FINDS EVIDENCE THAT INAPPROPRIATE ACTION HAS BEEN TAKEN AGAINST PHYSICIANS RESULTING IN THE PRO ASCRIBING QUALITY POINTS AND/OR SANCTIONS.** The committee will also assist in providing informational and educational activities to such groups and individuals as may be appropriate, and advise other health care agencies on the issues of medical care quality.

■ **6. Proposed Bylaw Amendment to Ad Hoc Committee on Focused Professional Education, Article XI, Section 41 - ADOPTED**

*Rationale* – To redesignate this ad hoc committee to a standing committee.

*Amend Article XI, Section 41, as follows* – [ ] indicate deletion; CAPS indicate change.

**COMMITTEE ON FOCUSED PROFESSIONAL EDUCATION**  
**SECTION 41. – A COMMITTEE ON FOCUSED PROFESSIONAL EDUCATION, COMPRISED OF AT LEAST SIX MEMBERS, EACH OF WHOM SHALL BE APPOINTED BY THE PRESIDENT FOR A THREE-YEAR TERM ON A STAGGERED BASIS. THE PRESIDENT SHALL APPOINT THE CHAIRPERSON ANNUALLY FROM AMONG THE COMMITTEE MEMBERS. THE COMMITTEE SHALL PLAN, DEVELOP, AND COORDINATE EDUCATIONAL PROGRAMS SPECIFICALLY TO MEET THE NEEDS OF INDIVIDUAL PHYSICIANS. THE COMMITTEE'S PROGRAMS WILL FOCUS ON THE IDENTIFIED DEFICITS IN A PHYSICIAN'S PRACTICE, ASSESS THE PHYSICIAN'S NEEDS, ADDRESS THOSE NEEDS THROUGH SPECIFIC EDUCATIONAL ACTIVITIES INCLUDING INTERACTION WITH A PRECEPTOR, AND EVALUATE THE PROGRAM AT ITS CONCLUSION. THE COMMITTEE SHALL RECEIVE REFERRALS FROM THE BOARD OF PHYSICIAN QUALITY ASSURANCE OF PHYSICIANS WHO AS A RESULT OF THE PEER REVIEW PROCESS HAVE BEEN IDENTIFIED AS NEEDING EDUCATION; IT MAY RECEIVE REFERRALS FROM OTHER SOURCES SUCH AS THE FACULTY'S PHYSICIAN REHABILITA-**

**TION PROGRAM OR OTHER MEDICAL REVIEW ORGANIZATIONS. INDIVIDUAL PHYSICIANS MAY ENTER THIS FOCUSED EDUCATION PROGRAM EITHER ON A VOLUNTARY OR NONVOLUNTARY BASIS. PHYSICIANS ENTERING THIS PROGRAM MAY BE REQUIRED TO PAY EXPENSES ASSOCIATED WITH THE DEVELOPMENT OF THEIR SPECIFIC PROGRAM, COSTS ASSOCIATED WITH THE PRECEPTOR PROGRAM OR COSTS ASSOCIATED WITH HOSPITAL OR MEDICAL SCHOOL INVOLVEMENT.**

■ **7. Proposed Bylaw Amendment to Membership, Article II, Section 2 (c) - ADOPTED**

*Rationale* – To add that membership on the Focused Professional Education Committee be restricted to Med Chi members as is already established for the other peer review committees.

*Amend Article II, Section 2 (c), as follows* – [ ] indicate deletion; CAPS indicate change.

Section 2. – (c) Associate members all have the right to attend and participate in General Meetings; subscribe to the *Maryland Medical Journal*; have the privileges of the building, the reading room, the use of the books and to hold such meetings in the building as meet with the approval of the Executive Committee. They shall not have the right to vote or hold office in their component societies, but may be appointed to serve on committees of the Faculty, except the Committee on Physician/Patient Relations, the Committee on Peer Review, the Peer Review Management Committee, [and] the Committee on Drugs, **AND THE FOCUSED PROFESSIONAL EDUCATION COMMITTEE.** Those associate members who are Doctors of Medicine engaged in the clinical practice of medicine, shall have the right of physician's defense.

■ **3. Proposed Bylaw Amendment to Committee on Small Area Practice Variation, Article XI, Section 34 - ADOPTED**

*Rationale* – To delete as a standing committee. In the future, should the need for a specific study or studies occur, such studies may be submitted to an existing standing committee based on the subject of the study or to the Committee on Specialty Societies for inter-specialty coordination or the President may establish an ad hoc committee in accordance with existing bylaws.

*Amend Article XI, Section 34, as follows* – [ ] indicate deletion.

[Section 34. – A Committee on Small Area Practice Variation consisting of at least five members shall be appointed by the President. The President shall designate the Chairman. All members shall be chosen for their knowledge, experience and interest in small area analysis and medical practice variation. The committee shall act as an analytical group to review studies conducted by outside organizations and shall be authorized to conduct independent studies upon approval by the Executive Committee.]

A comment was made as to the rationale behind deletion of this Committee. The rationale contained in the report was clarified and no further discussion was made. The Chairperson of the

Bylaws Committee recommended this amendment for adoption and the Committee on Small Area Practice Variation was deleted.

■ **5. Proposed Bylaw Amendment to Music Medicine Clearinghouse Committee, Article XI, Section 40 - ADOPTED**

*Rationale* – To have editorial changes made to the Bylaws to reflect the new name and charge of the committee.

*Amend Article XI, Section 11, as follows* – [ ] indicate deletion; CAPS indicate change.

[Music Medicine Clearinghouse Committee]

[Section 40. – A Music Medicine Clearinghouse Committee of at least five members shall be appointed annually by the President to collect, organize, and disseminate information relating to the medical problems of musicians. The goal is to acquire original copies of books, journal articles, and other published materials in all languages, encompassing both traditional medical viewpoints and various alternative therapies. The collection will include items of rare or historical importance as well as archival materials. Clearinghouse information will be stored and organized so that it is available and useful to physicians, other health care professionals, musicians, educators, and researchers. Materials will be made available as widely as possible.]

COMMITTEE ON MEDICINE AND THE PERFORMING ARTS

SECTION 40. – A COMMITTEE ON MEDICINE AND THE PERFORMING ARTS, CONSISTING OF AT LEAST FIVE MEMBERS WHO SHALL BE APPOINTED BY THE PRESIDENT FOR A ONE-YEAR TERM, WILL STUDY THE ILLNESSES AND INJURIES TO WHICH PERFORMING ARTISTS ARE SUBJECT. FROM TIME TO TIME, THEY WILL REPORT ON THE MEDICAL ASPECTS OF SUCH CONDITIONS AND RECOMMEND PREVENTIVE AND PROTECTIVE ACTIONS THAT WILL BENEFIT THE ARTISTS AND THEIR PERFORMANCES. THE COMMITTEE ON MEDICINE AND THE PERFORMING ARTS WILL CONTINUE THE CLEARINGHOUSE ACTIVITIES THAT HAVE BEEN UNDERTAKEN BY THE MEDICAL AND CHIRURGICAL FACULTY. THE CLEARINGHOUSE, AN INTERNATIONALLY RECOGNIZED COLLECTION OF INFORMATION RELATING TO THE MEDICAL AND SURGICAL PROBLEMS OF MUSICIANS, WILL MAKE THESE RESOURCES AVAILABLE TO PHYSICIANS, MUSICIANS, EDUCATORS, AND RESEARCHERS. THE COMMITTEE WILL COOPERATE WITH OTHER GROUPS INTERESTED IN THE FUNCTIONAL PREPARATION OF ARTISTS, MAINTENANCE OF THEIR PHYSICAL SKILLS, AND REHABILITATION AFTER INJURY OR ILLNESS. THE PRESIDENT SHALL APPOINT THE CHAIRPERSON ANNUALLY.

A question was raised as to whether this Committee would only be concerned with problems of musicians or of participants in other performing arts as well (e.g., dancers). The Chairperson stated that the purpose of this Bylaws change was to insure such expansion. There was some discussion as to the need for this being a standing committee; however, no motion was made. The Bylaws Committee

Chairperson recommended adoption and the amendment was adopted as presented.

■ **8. Proposed Bylaw Amendment to Officers, Article IV, Section 6 - REMANDED TO COMMITTEE**

*Rationale* – To amend the current bylaws now requiring a delay of one year before certain elective officers assume the position to which elected. (Should this bylaw amendment be adopted by the House of Delegates it shall not take effect until the conclusion of the Annual Session 1993. Also, the Nominating Committee for 1992 will not consider nominees for the three Vice Presidents, Secretary, and Treasurer - these positions being filled by action of the 1991 Nominating Committee.)

*Amend Article IV, Section 6, as follows* – [ ] indicate deletion; CAPS indicate change.

Section 6. – Elective Officers except Councilors shall hold office for a term of one year or until their successors are elected. Councilors shall hold office for a term of three years, **PROVIDED THAT THEY MAY NOT SERVE MORE THAN TWO CONSECUTIVE TERMS.** [with the exception of] The representative of the Committee on Specialty Societies [who] shall serve for a term of one year, or until their successors are elected. [provided that they may not serve more than two consecutive terms.] Elective officers, except Councilors, shall assume their duties at the close of the annual session [one year after their election, except that the President shall assume that office at the close of the annual session] at which [he is] **THEY ARE** elected. Councilors in each newly elected annual class shall assume their duties at the close of the annual session immediately preceding which they were elected.

It was moved and adopted to remove this matter back to the Bylaws Committee because of its lack of clarity:

■ **Nominations**

The Chairperson of the Nominating Committee, Dr. Raymond Atkins, presented the list of nominees for House of Delegate offices as follows:

—**President-elect (1991-92)**

*Jose M. Yosuido MD, Baltimore City*

—**First Vice President (1992)**

*Gary L. Rosenberg MD, Baltimore City*

—**Second Vice President (1992)**

*Benjamin Maldonado MD, Prince George's County*

—**Third Vice President (1992)**

*Alex Azar MD, Wicomico County*

—**Secretary (1992)**

*Albert L. Blumberg MD, Baltimore County*

—**Treasurer (1992)**

*Lawrence H. Fink MD*, Montgomery County

—**Committee on Scientific Activity (1992-1998)**

*Esther Edery MD*, Baltimore County

—**Finney Fund Committee (1992-1997)**

*Daniel C. Finney*, Baltimore City

—**Delegates to the AMA**

*J. David Nagel MD*, Baltimore County

*Neil Novin MD*, Baltimore City

*Cheryl E. Winchell MD*, Montgomery County

*R. Marshall Ackerman MD*, Montgomery County

*Mary M. Newman MD*, Baltimore City

*Karakat S. Gokulanathan MD*, Prince George's County

After the Chairperson of the Nominating Committee presented the slate of nominees, Dr. Lee-Llacer asked if there were any further nominations. There were no further nominations from the floor for President-elect, First Vice President,

Second Vice President, Third Vice President, Secretary, Treasurer, Nominee for the Committee on Scientific Activity, three AMA alternate delegate positions, or the AMA (Resident) alternate delegate position. Therefore, the nominations for these positions were closed.

The nominee for the Finney Fund Committee was Dr. Daniel C. Finney. Since Dr. Finney is no longer a Med Chi member, Dr. Joseph H. Hooper (Baltimore City) was nominated for this slot. There were no other nominations for this position. The House approved this nomination.

The slate of nominees for the three positions of Delegates to the AMA included Drs. J. David Nagel, Marvin Schneider, and Lawrence H. Fink. Also nominated from the floor were Drs. Michael Dobridge, Joseph Snyder, and John H. Hebb.

Dr. Lee-Llacer stated that if there were no objection to all offices or positions not contested, the ballot will be dispensed with for those positions. Since no objection was heard, this was so ordered.

Dr. Lee-Llacer mentioned that ballots would be prepared for all contested positions and balloting would be by plurality vote on Friday, May 10. It was stated that plurality vote would be such that if more than three nominees were contesting three positions, unless there were objections, the three receiving the highest number of votes would be declared the winners. There were no objections and the plurality vote position was accepted.

The nominations to the Board of Physician Quality Assurance (BPQA) were then discussed. Dr. Atkins announced that Dr. Susan Owens had asked that her name be withdrawn. Dr. Lee-Llacer read the list of nominees as follows: Drs. Reynaldo L. Lee-Llacer, Francis C. Mayle, K. George Dritsas, Suresh C. Gupta, Neil Novin, Cheryl E. Winchell, R. Marshall Ackerman, Mary M. Newman, and Karakat S. Gokulanathan. Dr. Lee-Llacer asked if there were any other nominations from the floor. Nominated were Drs. Charles Hobelman, Jr., Murli N. Mathur, and J. Andrew Sumner. These additional nominations to the BPQA slate were approved by the House. The highest number of votes will be submitted to the Governor. Twice the number of names as vacancies must be submitted. Since there are four vacancies, eight names will be submitted. Voting will take place on Friday and the vote will be by plurality.

Dr. Lee-Llacer mentioned that following the House of Delegates meeting, the Committee Chairpersons would be presented with certificates of appreciation for work done during the year.

There being no further business, the meeting was adjourned at 1:30 pm.

# The experience of a nationwide laboratory.

Wouldn't it be great if you could enjoy all the advantages of a nationally—  
accredited testing laboratory—right here in your own neighborhood?

Well, now you can.

- The nation's largest full-service clinical laboratory network
- Over 25 years experience in laboratory toxicology
- Accredited by the College of American Pathologists (CAP)
- Licensed by the U.S. Department of Health and Human Services

- Local courier network works on your schedule around the clock

- 24-hour turnaround time on most routine tests

- Extensive internal quality control program ensures the accuracy you need to prescribe proper treatment for your patients

- A commitment to serve and serve well.

## Minutes of the Annual Session of the Med Chi House of Delegates (334th Meeting)

Medical and Chirurgical Faculty of Maryland  
May 10, 1991

The 334th meeting, second of the 193rd Annual Session of the House of Delegates of the Medical and Chirurgical Faculty, was held on Friday, May 10, 1991 at the University of Maryland, University College Center for Adult Education, College Park, Maryland.

Officers present were Reynaldo Lee-Llacer MD, President; Jose M. Yosuco MD, Treasurer; Marvin Schneider MD, Chairperson of the Council; Gary Rosenberg MD, Vice Chairperson; and J. David Nagel MD, President-elect. Also present but not on the podium was Lawrence H. Fink MD, Treasurer-elect.

The following delegates (or alternates) were registered as being in attendance; an asterisk (\*) next to a name denotes an alternate delegate.

*Members of the Faculty's staff were also present.*

**T**he meeting was called to order at 2:00 pm on Friday, May 10, 1991 by the President, Reynaldo Lee-Llacer MD.

#### ■ Introduction of Visitors

The President introduced visiting dignitaries as follows: Dr. John Owen, Jr. and his wife, Wanda, from the Virginia Medical Society; and Dr. William E. Ryan from the New Jersey Medical Society.

#### ■ Election

There being only one candidate for each office, the ballot was dispensed with by unanimous consent on Wednesday and the following were elected by voice vote:

*Jose M. Yosunico MD, President-elect  
Gary L. Rosenberg MD, First Vice President  
Benjamin Maldonado MD, Second Vice President  
Alex Azar MD, Third Vice President  
Albert L. Blumberg MD, Secretary  
Lawrence H. Fink MD, Treasurer  
Esther Edery MD, Committee on Scientific Activity  
Joseph H. Hooper MD, Finney Fund  
Raymond M. Atkins MD, Alternate Delegate AMA  
Alex Azar MD, Alternate Delegate AMA  
Reynaldo L. Lee-Llacer MD, Alternate Delegate AMA  
Clinton H. Leinweber MD, Alternate Delegate AMA  
(Resident)*

The next election was for Delegates to the American Medical Association (AMA). The nominees for the three positions were:

*Michael R. Dobridge MD  
Lawrence H. Fink MD  
John H. Hebb MD  
J. David Nagel MD  
Marvin Schneider MD  
Joseph Snyder MD*

A question was raised concerning the appropriateness of the plurality versus majority vote. Dr. Lee-Llacer reminded the House of Delegates that on Wednesday, May 8, the same issue had been raised and there had been no objection. Therefore, his position was to accept the view of the House meeting on Wednesday; the vote for AMA Delegates should be by plurality. Several other members rose, some supporting the plurality vote concept, others espousing a majority vote concept. The Chairperson turned the matter over to the Parliamentarian who

reiterated that the outcome of the Wednesday meeting was such that a plurality vote was appropriate in that the House addressed that issue and made that decision. Some members persisted and Dr. Lee-Llacer again discussed the issue with the Parliamentarian. He returned to the podium presenting his position that since there were numerous questions concerning the matter, the vote would be by majority vote. This position satisfied those present.

Dr. Lee-Llacer appointed tellers to distribute the ballots. Appointed were Dr. Paul Stagg, Chief Teller, and Drs. Fitzpatrick, Figuero, DeLeon, and Fastow.

The Chairperson stated that the nominees or persons wishing to speak on behalf of the nominees were allowed to speak for a period not to exceed two minutes. When all who wished to speak had concluded, the tellers distributed the ballots and the Chairperson inquired if everyone who wished to vote had voted. There were no objections to the ballots being taken away by the tellers. The tellers left the auditorium and completed the ballot count. After returning, the Chief Teller announced that two candidates for AMA Delegates had received a majority of the votes cast. Dr. Lee-Llacer announced that Drs. John H. Hebb and J. David Nagel won by a majority of the votes cast. He also announced that another ballot was needed since there were originally three vacant seats. At this time, Dr. Lawrence H. Fink requested the privilege of the floor. He stated he wished to withdraw his name as a candidate for the AMA Delegation. Several members of the House endorsed some of the remaining candidates for the last position. When all discussion was completed, the ballots for the second election were distributed. Once again, Dr. Lee-Llacer asked if all had voted who wished to vote; there were no requests for an extension of time. The tellers removed the ballots from the auditorium for the ballot count. Upon his return, Dr. Paul Stagg, Chief Teller, reported to the President that a third nominee had obtained a majority vote. Dr. Lee-Llacer announced that the third Delegate was Dr. Marvin Schneider. At this point, Dr. Michael Dobridge received the privilege of the floor. He thanked those present for their past support of him as a Delegate to the AMA. Dr. Joseph Snyder also thanked those present for their support for him.

Dr. Lawrence H. Fink requested the privilege of the floor. He stated that effective immediately, he was resigning from all offices of the Faculty and suggested that both Drs. Dobridge and Snyder do the same since they had not been endorsed by the Montgomery County Medical Society for the positions to which they had sought re-election. Also, inasmuch as the Montgomery County Medical

Society had not supported them, they should not have been asked to be placed on the ballot. At this point in time, Dr. Fink left the auditorium.

Dr. Lee-Llacer announced that the next item of business was the selection of eight nominees to be submitted to the Governor to fill positions on the Board of Physician Quality Assurance (BPQA). This ballot would be by a plurality vote. There were no challenges to the floor on this matter and Dr. Lee-Llacer announced the nominees. The nominees were:

- R. Marshall Ackerman MD*
- Raymond M. Atkins MD*
- K. George Dritsas MD*
- Karakat S. Gokulanathan MD*
- Suresh C. Gupta MD*
- Charles F. Hobelmann, Jr. MD*
- Reynaldo L. Lee-Llacer MD*
- Murli N. Mathur MD*
- Francis C. Mayle MD*
- Mary M. Newman MD*
- Neil Novin MD*
- James A. Sumner MD*
- Cheryl E. Winchell MD*

Ballots were handed out to the Delegates, collected, and counted. The Chairperson inquired if everyone who wished to vote had voted. Hearing no objection, the ballots were collected and the tellers left the auditorium for the ballot counting. The Chief Teller gave the results of the ballot to

the Chairperson who announced the names of the eight names to be submitted:

*R. Marshall Ackerman MD*

*Raymond M. Atkins MD*

*K. George Dritsas MD*

*Charles F. Hobelman, Jr. MD*

*Reynaldo L. Lee-Llacer MD*

*Francis C. Mayle MD*

*Mary M. Newman MD*

*Cheryl E. Winchell MD*

### ■ Dr. Raymond Scalletar

The President asked Dr. Ray Scalletar, a member of the Board of Trustees of the AMA and a member of the District of Columbia Medical Society to come forward. Dr. Lee-Llacer, on behalf of all members of the Medical and Chirurgical Faculty, stated that he was honored to present a Certificate of Appreciation to Dr. Scalletar for his personal efforts and the assistance he provided in ensuring compliance with hospital medical staff bylaw standards of the Joint Commission on Accreditation of Healthcare Organizations. The standards require the active participation of the hospital medical staff in the development of the hospital medical staff bylaws.

Dr. Scalletar spoke briefly, offering his sincerest appreciation for the opportunity to be present and to be heard by the House of Delegates of the Med Chi Faculty.

### ■ The Honorable Steny Hoyer

The President introduced Congressman Steny Hoyer to the House of Delegates as one who could always be counted on to support physicians. Congressman Hoyer spoke about the issues facing medicine and Congress in the 1990s. His speech was loudly applauded by the House of Delegates. After his presentation, Dr. Reynaldo Lee-Llacer presented Congressman Hoyer with a Med Chi Certificate of Achievement for all his past work.

### ■ Auxiliary Report

Dr. Lee-Llacer recognized Mrs. Josefina Figueroa, President of the Auxiliary, who gave the Auxiliary report. She highlighted several of the projects carried out by component auxiliaries and thanked the House of Delegates for its continued support.

### ■ MMPAC

Dr. J. David Nagel spoke on behalf of Dr. Fred Hatem, spokesperson for MMPAC. He reiterated the importance of joining MMPAC and stated that staff would be available to accept checks from anyone who wished to join today.

### ■ Announcement

The President noted that the Council will meet immediately following the adjournment of the House of Delegates for the purposes of electing a Chairperson and Vice Chairperson, and the transaction of other business that may properly come before it.

### ■ President's Farewell Speech

The outgoing President, Reynaldo L. Lee-Llacer MD, addressed the House. He asked for a moment of silence in honor of all Americans who served and lost their lives in the Persian Gulf war and paid tribute to all Maryland physicians who were called to action in Operation Desert Storm. He mentioned that the highest service any person can provide is to protect the life of another human being. Dr. Lee-Llacer closed by sharing a prayer of Maimonides and thanked the House for the opportunity to serve as President.

### ■ Change of Presidency

The Chairperson then asked the incoming President, J. David Nagel MD, and his wife, Dianne, to step forward. The oath of office for the President of the Medical and Chirurgical Faculty of Maryland was administered. Dr. Nagel was presented with the President's Medallion, which is to be worn when he visits other states, as well as during official ceremonies of Med Chi.

Dr. Nagel then presented the Past President's Medallion to Dr. Lee-Llacer. Dr. Lee-Llacer, in turn, presented Dr. Nagel with the gavel signifying the change in the presidency. Dr. Nagel addressed the House and called for a commitment on behalf of all of the members, asking all the members to become more involved with the practice of medicine and within the Med Chi committee structure. At the conclusion of his presentation, the House gave both Dr. Lee-Llacer and Dr. Nagel a standing ovation.

### ■ Adjournment

There being no further business, the meeting was adjourned *sine die* at 4:00 pm.

# COMING OUT OF THE DARK

Med Chi's Physician Rehabilitation Committee deals with the substance abuse and mental health problems of Maryland physicians, with a confidential and nondisciplinary focus...Addiction, Marital/Family Conflicts, Psychiatric Illness, Organic Impairment, Physical Handicap...If these problems exist, we can help find the solution. Call us.

The Physician Rehabilitation Committee of Med Chi is available to all Maryland physicians, and their families.

The Committee is NONDISCIPLINARY and information is kept CONFIDENTIAL. If you, a colleague, or family member is in need of our services call (301)962-5580 or call toll free (800)992-7010, or leave a message 24 hours a day, 7 days a week at (301)727-1020.

*HELPING IS OUR BUSINESS...All donations to the Physician Rehabilitation Committee are used for the delivery of services to Maryland physicians in need of help. If you wish to help further the work of the Committee through a tax deductible donation send your check to: The Medical and Chirurgical Faculty Charitable/Educational Foundation, 1204 Maryland Avenue, Baltimore, Maryland 21201 Please note on your donation: "Physician Rehab"*

# Meet the new team in town.

Maryland General Hospital of Baltimore has teamed up with Bryn Mawr Rehab of Malvern, Pennsylvania, one of the premier physical medicine and rehabilitation facilities in the country to form *Maryland General-Bryn Mawr Rehab Center*.

The new center, staffed by 50 of the finest rehab physicians, therapists, nurses and clinical specialists in the area, will offer the highest quality, comprehensive inpatient and outpatient rehabilitation services.

*Maryland General-Bryn Mawr Rehab Center* features 33 inpatient rehab beds with 15 devoted

to brain injured patients and 18 designated for orthopedic and neurological rehabilitation. Outpatient services are available at the Maryland General Campus in Baltimore and at our satellite health care centers in the neighboring communities of Catonsville and Timonium.

We invite you to meet the new team in town. Call Mary Filippelli, our Administrative Director at (301) 225-8380 to get all the details and to arrange for a tour of our new facility.

*Maryland General-Bryn Mawr Rehab Center.* When it comes to rehab care, we're strictly major league.

## Committee on AIDS

*Mr. President and Members of the House of Delegates:*

**T**he Committee on AIDS had a very productive year during 1990-1991. It was responsible for the enactment of several new Med Chi policies and programs dealing with AIDS and HIV infection, and also encouraged new State laws on the disease.

In July, the Committee identified three subjects as initial goals for the Committee: (1) to improve screening for HIV infection; (2) to improve access and treatment for HIV infected people; and (3) to eliminate discrimination of persons with AIDS in Maryland.

### ■ HIV and AIDS Legislation

To improve screening for HIV infection, the Committee agreed to encourage Med Chi to lobby for and propose legislation expanding HIV testing laws in Maryland. The Committee worked in conjunction with the Legislative Committee and Med Chi's lobbyist to develop draft legislation requiring individuals who serve as the source of significant exposure to health care workers to be tested for HIV. Introduced by Senator Murphy as Senate Bill 156, this legislation would have provided for mandated testing of patients when there had been a significant exposure between that patient and a health care worker. SB 156 did not pass.

The Committee also supported Senator Hollinger's HIV health care providers bill, SB 203. This legislation was passed during the 1991 session and signed by Governor Schaefer in May. SB 203 differs from SB 156 in that it requires informed consent prior to the testing of patients. The bill is based on the premise that 90 percent of all those who are requested to take an HIV test will give consent. Of the remaining ten percent, seven to eight percent will have either died or become incompetent or comatose and will, therefore, be unable to give informed consent. For those individuals, SB 203 allows for substitute consent. The bill also includes an amendment requiring Med Chi to consult with the Centers for Disease Control, the Maryland AIDS Administration, and the Maryland Hospital Association to develop practice protocols for health care workers infected with HIV. The protocols are to be submitted to the Legislature on December 2, 1991.

The Committee also supported SB 97, a bill repealing a requirement for laboratories to report HIV results to the State Health Department. Under current law, both physicians and medical labs report HIV test results which lead to duplicate information. This bill was signed into law in May 1991.

Several Committee members represented Med Chi before the Governor's Council on AIDS and testified before the Legislature this Session.

### ■ Faculty Position Paper on AIDS

In February 1991, Med Chi's Executive Committee accepted the Committee's revisions to the Faculty Position on AIDS, establishing a formal position on the following topics:

- education, prevention, and treatment programs;
- discrimination;
- protection of health care workers and patients;
- refusal of treatment because of a positive HIV antibody test;
- mandatory reporting; and
- access to care.

Under the new Faculty Position, Med Chi supports legislation for mandatory testing of individuals who serve as sources of significant HIV exposure for health care workers. The Faculty Position maintains that "Similar testing of health care workers and patients should be done when a significant exposure has taken place between the health care worker and the patient in order to protect the patient." In addition, the Faculty Position states, "Physicians who are aware of their HIV positive status have an ethical responsibility to report their HIV status appropriately."

### ■ Access to Care

The new Faculty Position includes a section entitled, "Access to Care," that attempts to fulfill the Committee's second goal for 1990-1991:

- The allocation of funds for AIDS care severely limits reimbursement rates for professional services at a time when increasing numbers of physicians are needed to care for patients with HIV infection. This has a negative impact on the care of economically disadvantaged persons including an increasing number of intravenous drug users with HIV infection. Med Chi encourages adequate funding of care that will provide for management of HIV infection at all stages of the disease.

Committee members met with representatives from the Maryland Medical Assistance Program in an effort to solve this problem.

In addition, Vice Chairman John G. Bartlett MD conducted studies on drug costs and social work issues for HIV patients in an effort to improve treatment for these patients.

Dr. Bartlett presented the results of a study of various drug regimens and their cost to HIV patients. He concluded that

using less costly drug therapies for HIV patients results in substantial savings without sacrificing quality of care. The Committee hopes to present the results of this study to the Maryland AIDS Administration for its consideration and comments.

In his examination of social work issues, Dr. Bartlett presented a paper examining various social work problems for AIDS patients at The Johns Hopkins Hospital. The paper illustrated the variety of barriers many AIDS patients confront before receiving the special social work assistance they require. Dr. Bartlett also observed that many of the barriers to social work help are unnecessary or avoidable. The Committee hopes to work with the Department of Social Services and the AIDS Administration in order to alleviate these problems for patients.

#### ■ Education

In May 1991, the Committee presented a session during the Med Chi Annual Meeting, "HIV Today: Testing, Transmission and Treatment."

Panel speakers included:

- Committee Vice Chairman John G. Bartlett MD who spoke on "Interpretation of HIV Tests";
- Baltimore Academy of Surgeons President Thomas R. Gadacz MD who described the "Risk of HIV Transmission from Health Care Workers to Patients";
- David Henderson MD, Associate Director of Quality Assurance and Hospital Epidemiology for the National Institutes of Health, who explored ways to "Control HIV Transmission in Hospitals"; and
- Henry Masur MD, Chief of Critical Care Medicine for the National Institutes of Health, who spoke on "New Aspects in AIDS Treatment."

The Committee on AIDS looks forward to the coming year and thanks the membership and leadership of Med Chi for their support. As Chairperson, I thank all the members of my Committee who have helped make this a productive and successful year.

## Committee on Alcoholism and Chemical Dependency

*Mr. President and Members of the House of Delegates:*

**T**he Committee on Alcoholism and Chemical Dependency continued its efforts toward raising awareness of the dangers of alcohol and substance abuse, including smoking.

The Committee presented two resolutions to Council: the banning of cigarette vending machines, and the banning of tobacco product advertising at the Stadium. The resolutions, aimed at reducing the consumption of tobacco products by youths, were approved by Council. Unfortunately, they were defeated in the 1991 State Legislature.

The Committee supported legislation to increase the excise tax on the sale of tobacco products in Maryland. The bill was passed by the State Legislature.

In concert with the Committee on Drugs and the Physician Rehabilitation Committee, the Committee on Alcoholism and Chemical Dependency sponsored a highly successful two-day conference, "Practical Clinical Management: Drug Abuse Education for the Primary Care Physician," which took place on October 20 and 21, 1990.

The Committee also cosponsored the presentation, "Drug Utilization Review," at Med Chi's 193rd Annual Meeting. The presentation, given by Richard D. Baylis PharmD, Director, Maryland Pharmacy Association, was well-received.

The Committee continues to work diligently to address a wide range of concerns about substance abuse. As the year ends, the Committee is in the process of working on supporting the recognition of Addiction Medicine as a Board Certified Specialty and is looking forward to sponsoring workshops on training physicians in smoking cessation techniques. The Committee is also planning to cosponsor another drug conference in the fall of 1991.

I wish to thank the Faculty, the Committee members, and the staff for their assistance and support this past year.

*Franklin T. Evans MD, Chairperson*

*Claude R. Feinstein MD*

## Bylaws Committee

*Mr. President and Members of the House of Delegates:*

**A**t the Semiannual Meeting, September 15, 1990, the Bylaws Committee recommended the following bylaw amendments to the House of Delegates for its consideration:

### ■ 1. Proposed Bylaw Amendment to the Ad Hoc Music Medicine Clearinghouse Committee

*Rationale* — To change the status of the Ad Hoc Music Medicine Clearinghouse Committee to make it a standing committee of the Faculty.

*Amend By Addition of Article XI, Section 40, as follows* — [ ] indicate deletion; CAPS indicate change.

SECTION 40. — A MUSIC MEDICINE CLEARINGHOUSE COMMITTEE OF AT LEAST FIVE MEMBERS SHALL BE APPOINTED ANNUALLY BY THE PRESIDENT TO COLLECT, ORGANIZE, AND DISSEMINATE INFORMATION RELATING TO THE MEDICAL PROBLEMS OF MUSICIANS. THE GOAL IS TO ACQUIRE ORIGINAL COPIES OF BOOKS, JOURNAL ARTICLES, AND OTHER PUBLISHED MATERIALS IN ALL LANGUAGES, ENCOMPASSING BOTH TRADITIONAL MEDICAL VIEWPOINTS AND VARIOUS ALTERNATIVE THERAPIES. THE COLLECTION WILL INCLUDE ITEMS OF RARE OR HISTORICAL IMPORTANCE AS WELL AS ARCHIVAL MATERIALS. CLEARINGHOUSE INFORMATION WILL BE STORED AND ORGANIZED SO THAT IT IS AVAILABLE AND USEFUL TO PHYSICIANS, OTHER HEALTH CARE PROFESSIONALS, MUSICIANS, EDUCATORS, AND RESEARCHERS. MATERIALS WILL BE MADE AVAILABLE AS WIDELY AS POSSIBLE.

The Bylaws Committee recommended adoption of this proposed amendment.

### ■ 2. Proposed Bylaw Amendment to the Committee on Drugs, Article XI, Section 7

*Rationale* — To establish staggered terms of office for appointed members of the committee.

*Amend Article XI, Section 7, as follows* — [ ] indicate deletion; CAPS indicate change.

Section 7. — A Committee on Drugs of at least five members WHO SHALL SERVE ON A THREE-YEAR STAGGERED TERM BASIS. THE PRESIDENT SHALL SELECT ONE-THIRD OF ITS MEMBERS EACH YEAR FOR A THREE-YEAR TERM. THE PRESIDENT WILL ALSO APPOINT THE CHAIRMAN. THE COMMITTEE shall be responsible for evaluating the appropriateness of prescribing controlled dangerous drugs and shall work closely with appropriate governmental authorities in controlling the abuse of controlled dangerous substances by physicians and be alert to legislative

and regulatory proposals regarding prescription drugs, standing ready to provide expertise in this area to such agencies or groups as request it; may provide educational material in the form of lectures and other didactic information on the current knowledge concerning prescribing controlled substances; may provide support and advice to the Department of Health and Mental Hygiene to urge that there are adequate facilities available 24 hours a day to treat all of the victims, both professional and otherwise, of drug abuse and its complications. [Its chairman and members shall be appointed annually by the President.]

The Bylaws Committee recommended adoption of this proposed amendment.

### ■ 3. Proposed Bylaw Amendment to Physician/Patient Relations Committee, Article XI, Section 25

*Rationale* — To establish staggered terms of office for appointed members of the committee.

*Amend Article XI, Section 25, as shown below* — [ ] indicate deletion; CAPS indicate change.

Section 25. — A Physician/Patient Relations Committee composed of at least nine members WHO SHALL SERVE ON A THREE-YEAR STAGGERED TERM BASIS. THE PRESIDENT SHALL SELECT ONE-THIRD OF ITS MEMBERS EACH YEAR FOR A THREE-YEAR TERM. THE PRESIDENT WILL ALSO APPOINT THE CHAIRMAN. THE COMMITTEE shall hear and determine all grievances or complaints growing out of the practice of medicine as provided by these bylaws and mediate all problems involving or growing out of the practice of medicine. [The chairman shall be appointed by the President.]

The Bylaws Committee recommended adoption of this proposed amendment.

### ■ 4. Proposed Bylaw Amendment to the Peer Review Management Committee, Article XI, Section 24

*Rationale* — To establish staggered terms of office for appointed members of the committee.

*Amend Article XI, Section 24, Peer Review Management Committee, as follows* — [ ] indicate deletion; CAPS indicate change.

Section 24. — A Peer Review Management Committee (PRMC) shall consist of not less than nine members WHO SHALL SERVE ON A THREE-YEAR STAGGERED TERM BASIS and be selected from nominees submitted by component societies. Appointments shall be based on the nominees' experience on the medical review committee. [The chairman and members shall be appointed by the President.] THE PRESIDENT SHALL SELECT ONE-THIRD OF ITS MEMBERS EACH YEAR FOR A THREE-YEAR TERM. THE PRESIDENT WILL ALSO APPOINT THE CHAIRMAN. The Chairman or his designee may serve in an ex-officio capacity on the Board of Physician Quality Assurance. It shall be the duty of the committee to receive and record cases referred by the Board of Physician Quality Assurance; to identify the guidelines to be used in conducting reviews; refer cases to the appropriate Med Chi committee, component, specialty society or regional commit-

tee; to monitor the status of each case; to review reports received from investigating committees to determine adequacy of the review and the report and either transmit the report to the Board of Physician Quality Assurance or return it to the investigating committee with any inadequacies specified. Further, it shall be the duty of this committee to provide educational programs throughout Maryland to emphasize the elements of peer review; to provide organizational assistance to any review committee in Maryland; and to gather, analyze, and report statistical information annually for use by the Board of Physician Quality Assurance, Med Chi, and component societies in evaluating and upgrading the peer review process.

The Bylaws Committee recommended adoption of this proposed amendment.

## ■ 5. Proposed Bylaw Amendment to the House of Delegates, Article VI, Section 2

*Rationale* — To delete for clarification of language.

*Amend Article VI, Section 2*, as follows — [ ] indicate deletion.

Section 2. -- Regular meetings of the House of Delegates shall be held during the annual and semiannual sessions. At the annual session it shall meet on the opening day and at any session it may adjourn to meet from time to time as it may deem necessary, provided that its meetings shall conflict as little as possible with General Meetings. Special sessions may be called by the President [of the Council] and shall be called on the written request of 50 Delegates.

The Bylaws Committee recommended adoption of this proposed bylaw amendment.

**A**t the May 1991 Annual Meeting, the Bylaws Committee recommended the following bylaw amendments to the House of Delegates for its consideration:

## ■ 1. Proposed Bylaw Amendment to the Med Chi Insurance Fund, Article X, Section 1

*Rationale* — To clarify verbiage in the bylaws.

*Amend Article X, Section 1*, as follows — [ ] indicate deletion; CAPS indicate change.

Section 1. — There shall be a Med Chi Insurance Fund composed of seven Directors and it shall have the powers and duties provided from time to time by the [Articles of Incorporation] MED CHI INSURANCE FUND BYLAWS and any amendments thereto.

The Bylaws Committee recommended adoption of this proposed amendment.

## ■ 2. Proposed Bylaw Amendment to Finance Committee, Article XI, Section 10

*Rationale* — To increase the size of the committee from five to seven members.

*Amend Article X, Section 11*, as follows — [ ] indicate deletion; CAPS indicate change.

Section 11. — A Finance Committee to advise and counsel the Treasurer regarding the Faculty's financial and investment program shall be [composed] COMPRISED of the Treasurer and [four] SIX other members, [one] TWO of whom shall be appointed by the President each year for a [four] THREE-year term. The President shall annually designate the Chairman of the committee.

The Bylaws Committee recommended adoption of this proposed amendment.

## ■ 3. Proposed Bylaw Amendment to Committee on Small Area Practice Variation, Article XI, Section 34

*Rationale* — To delete as a standing committee. In the future, should the need for a specific study or studies occur, such studies may be submitted to an existing standing committee based on the subject of the study or to the Committee on Specialty Societies for inter-specialty coordination, or the President may establish an ad hoc committee in accordance with existing bylaws.

*Amend Article XI, Section 34*, as follows — [ ] indicate deletion.

[Section 34. — A Committee on Small Area Practice Variation consisting of at least five members shall be appointed by the President. The President shall designate the Chairman. All members shall be chosen for their knowledge, experience and interest in small area analysis and medical practice variation. The committee shall act as an analytical group to review studies

Presidential Banquet receiving line (l to r):

Angelo J. Troisi FACHE, Terry Troisi, Ernest E. Harmon MD, Elsie Harmon, Dianne Nagel, J. David Nagel MD, Josefina D. Figueroa, Zorayda Meneses Lee-Llacer MD, Reynaldo L. Lee-Llacer MD, Augusto Figueroa MD.

conducted by outside organizations and shall be authorized to conduct independent studies upon approval by the Executive Committee.]

The Bylaws Committee recommended deletion of Article XI, Section 34.

## ■ 4. Proposed Bylaw Amendment to the PRO Monitoring Committee Article XI, Section 29

*Rationale* — To more accurately reflect the activities of the Professional Review Organization (PRO) Monitoring Committee by adding verbiage to allow the PRO Monitoring Committee to respond in a timely manner to inappropriate actions taken by the PRO (which has the contract with the Health Care Financing Administration (HCFA) for the Maryland area) against physicians.

*Amend Article XI, Section 29*, as follows — CAPS indicate change.

Section 29. — The PRO Monitoring Committee shall be appointed by the President. The President shall designate the Chairman. All members shall be chosen for their knowledge, experience, and interest in the activities of the Professional Review Organizations. The committee shall act as an analytical group to review the effect of programs carried out by the appropriate designated organization which has the contract with respect to the cost and quality of medical care. THE COMMITTEE SHALL BE RESPONSIBLE FOR COMMUNICATING DIRECTLY WITH THE PRO IN INSTANCES WHERE THE COMMITTEE FINDS EVIDENCE THAT INAPPROPRIATE ACTION HAS BEEN TAKEN AGAINST PHYSICIANS RESULTING IN THE PRO ASCRIBING QUALITY POINTS AND/OR SANCTIONS. The committee will also assist in providing informational and educational activities to such groups and individuals as may be appropriate, and advise other health care agencies on the issues of medical care quality.

The Bylaws Committee recommended adoption of this proposed amendment.

## ■ 5. Proposed Bylaw Amendment to Music Medicine Clearinghouse Committee, Article XI, Section 40

*Rationale* — To have editorial changes made to the Bylaws to reflect the new name and charge of the committee.

*Amend Article XI, Section 11*, as follows — [ ] indicate deletion; CAPS indicate change.

[Music Medicine Clearinghouse Committee]

[Section 40. — A Music Medicine Clearinghouse Committee of at least five members shall be appointed annually by the President to collect, organize, and disseminate information relating to the medical problems of musicians. The goal is to acquire original copies of books, journal articles, and other published materials in all languages, encompassing both traditional medical viewpoints and various alternative therapies. The collection will include items of rare or historical importance as well as archival materials. Clearinghouse information will be stored and organized so that it is available and useful to physicians, other health care professionals, musicians, educators, and researchers. Materials will be made available as widely as possible.]

COMMITTEE ON MEDICINE AND THE PERFORMING ARTS  
SECTION 40. A COMMITTEE ON MEDICINE AND THE PERFORMING ARTS, CONSISTING OF AT LEAST FIVE MEMBERS WHO SHALL BE APPOINTED BY THE PRESIDENT FOR A ONE-YEAR TERM, WILL STUDY THE ILLNESSES AND INJURIES TO WHICH PERFORMING ARTISTS ARE SUBJECT. FROM TIME TO TIME THEY WILL REPORT ON THE MEDICAL ASPECTS OF SUCH CONDITIONS AND RECOMMEND PREVENTIVE AND PROTECTIVE ACTIONS THAT WILL BENEFIT THE ARTISTS AND THEIR PERFORMANCES. THE COMMITTEE ON MEDICINE AND THE PERFORMING ARTS WILL CONTINUE THE CLEARINGHOUSE ACTIVITIES THAT HAVE BEEN UNDERTAKEN BY THE MEDICAL AND SURGICAL FACULTY. THE CLEARINGHOUSE, AN INTERNATIONALLY RECOGNIZED COLLECTION OF INFORMATION RELATING TO THE MEDICAL AND SURGICAL PROBLEMS OF MUSICIANS, WILL MAKE THESE RESOURCES AVAILABLE TO PHYSICIANS, MUSICIANS, EDUCATORS, AND RESEARCHERS. THE COMMITTEE WILL COOPERATE WITH OTHER GROUPS INTERESTED IN THE FUNCTIONAL PREPARATION OF ARTISTS, MAINTENANCE OF THEIR PHYSICAL SKILLS, AND REHABILITATION AFTER INJURY OR ILLNESS. THE PRESIDENT SHALL APPOINT THE CHAIRPERSON ANNUALLY.

The Bylaws Committee recommended adoption of this proposed amendment.

## ■ 6. Proposed Bylaw Amendment to Ad Hoc Committee on Focused Professional Education, Article XI, Section 41

*Rationale* — To redesignate this ad hoc committee to a standing committee.

*Amend Article XI, Section 41*, as follows — CAPS indicate change.

COMMITTEE ON FOCUSED PROFESSIONAL EDUCATION  
SECTION 41. — A COMMITTEE ON FOCUSED PROFESSIONAL EDUCATION, COMPRISED OF AT LEAST SIX MEMBERS, EACH OF WHOM SHALL BE APPOINTED BY THE PRESIDENT FOR A THREE-YEAR TERM ON A STAGGERED BASIS. THE PRESIDENT SHALL APPOINT THE CHAIRPERSON ANNUALLY FROM AMONG THE COMMITTEE MEMBERS. THE COMMITTEE SHALL PLAN, DEVELOP, AND COORDINATE EDUCATIONAL PROGRAMS SPECIFICALLY TO MEET THE NEEDS OF INDIVIDUAL PHYSICIANS. THE COMMITTEE'S PROGRAMS WILL FOCUS ON THE IDENTIFIED DEFICITS IN A PHYSICIAN'S PRACTICE, ASSESS THE PHYSICIAN'S NEEDS, ADDRESS THOSE NEEDS THROUGH SPECIFIC EDUCATIONAL ACTIVITIES INCLUDING INTERACTION WITH A PRECEPTOR, AND EVALUATE THE PROGRAM AT ITS CONCLUSION. THE COMMITTEE SHALL RECEIVE REFERRALS FROM THE BOARD OF PHYSICIAN QUALITY ASSURANCE OF PHYSICIANS WHO AS A RESULT OF THE PEER REVIEW PROCESS HAVE BEEN IDENTIFIED AS NEEDING EDUCATION; IT MAY RECEIVE REFERRALS FROM OTHER SOURCES SUCH AS THE FACULTY'S PHYSICIAN REHABILITATION PROGRAM OR OTHER MEDICAL REVIEW ORGANIZATIONS. INDIVIDUAL PHYSICIANS MAY ENTER THIS FOCUSED EDUCATION PROGRAM EITHER ON A VOLUNTARY OR NON-VOLUNTARY BASIS. PHYSICIANS ENTERING THIS

PROGRAM MAY BE REQUIRED TO PAY EXPENSES ASSOCIATED WITH THE DEVELOPMENT OF THEIR SPECIFIC PROGRAM, COSTS ASSOCIATED WITH THE PRECEPTOR PROGRAM OR COSTS ASSOCIATED WITH HOSPITAL OR MEDICAL SCHOOL INVOLVEMENT.

The Bylaws Committee recommended adoption of this proposed amendment.

■ **7. Proposed Bylaw Amendment to Membership, Article II, Section 2 (c)**

**Rationale** — To add that membership on the Focused Professional Education Committee be restricted to Med Chi members as is already established for the other peer review committees.

**Amend Article II, Section 2 (c)**, as follows — [ ] indicate deletion; CAPS indicate change.

Section 2. — (c) Associate members all have the right to attend and participate in General Meetings; subscribe to the *Maryland Medical Journal*; have the privileges of the building, the reading room, the use of the books and to hold such meetings in the building as meet with the approval of the Executive Committee. They shall not have the right to vote or hold office in their component societies, but may be appointed to serve on committees of the Faculty, except the Committee on Physician/Patient Relations, the Committee on Peer Review, the Peer Review Management Committee, [and] the Committee on Drugs, AND THE FOCUSED PROFESSIONAL EDUCATION COMMITTEE. Those associate members who are Doctors of Medicine engaged in the clinical practice of medicine, shall have the right of physician's defense.

The Bylaws Committee recommended adoption of this proposed amendment.

This concludes the report of the Bylaws Committee.

Reynaldo L. Lee-Llacer MD (r) presents J. David Nagel MD with the Med Chi President's Medallion.

## Computers in Medicine Committee

*Mr. President and Members of the House of Delegates:*

The Computers in Medicine Committee held several meetings throughout the course of the year. The Committee maintains the Maryland Med-Sig -- the computerized bulletin board system of the Medical and Chirurgical Faculty. Dr. H. Gerald Oster has been the system operator (SYSOP) of Med-Sig since its inception.

The Committee is involved in a joint effort with the Med Chi Library, under the direction of the Executive Director, to design and implement an on-line CD-ROM system which runs MEDLINE, a computerized literature application; the members of the Committee have been chosen to help in the testing and debugging.

The Committee continues to give computer demonstrations to hospital medical staffs using a computer with a modem, a phone line, and a projection system. Under the direction of Dr. Rafael C. Haciski, the Committee's Chairperson, a three-hour demonstration was given at the Faculty's Annual Meeting dealing with office computerization on the industry's leading equipment. The seminar dealt with office management software, medical software, and some of the new experimental programs being used on the Apple computer, as well as the IBM compatible.

The Committee demonstrated the Med-Sig bulletin board system at the Faculty's Semiannual Meeting in Ocean City last September.

The Committee is planning a similar demonstration for the Faculty's Semiannual Meeting to be held at Ocean City in September 1991.

Potential projects are:

- Starting a physicians' computer-user group for both novices and advanced users.
- Evaluating medical software.
- Providing physicians with a computer equipment buyers' group.
- Continuing in the education of physicians using computers.
- Promoting Med-Sig as a communication tool for physicians in Maryland.

## Continuing Medical Education Review Committee

*Mr. President and Members of the House of Delegates:*

**T**he Continuing Medical Education (CME) Review Committee met six times during this past year. Med Chi's program of accreditation of sponsors of CME in Maryland was officially surveyed in July by the Committee on Recognition and Review (CRR) of the Accreditation Council for Continuing Medical Education (ACCME). The program continues to be in full compliance with all of the CRR requirements and has been granted full reaccreditation status through 1994.

The Committee sponsored a workshop on "Guidelines for Accreditation of Continuing Medical Education in Maryland" at the Annual Meeting. Over fifty physicians and staff support personnel attended the session on Wednesday, May 8, 1991.

The Committee was saddened by the passing of John W. Bullard PhD in November. Dr. Bullard served on the Committee for ten years as an advisory member. Recognition of his dedication and faithful service to the work of the Committee was given unanimous endorsement at the January meeting.

Review, accreditation, and reaccreditation actions were made with regard to the following sponsors:

1. American Cancer Society, Maryland Division
2. American Heart Association, Maryland Affiliate
3. American Lung Association of Maryland
4. Anne Arundel General Hospital
5. Baltimore County General Hospital
6. Bon Secours Hospital
7. Carroll County General Hospital

### Advisory Members

*John W. Bullard PhD  
Jack L. Mason PhD*

*Charles E. Osborne EdD*

## Committee on Drugs

*Mr. President and Members of the House of Delegates:*

The primary focus of the Committee on Drugs is the evaluation of the prescribing practices of physicians referred by the Board of Physician Quality Assurance (BPQA). These referrals are the result of consumer complaints or, in some instances, routine pharmacy surveys that identify questionable prescriptions of controlled substances.

The Committee met six times during the past year to discuss ten cases referred by the BPQA. In addition to reviewing pharmacy surveys and chart reviews, three physicians were interviewed by the full Committee.

As part of its educational activities, the Committee developed and sponsored a major drug abuse education program during the past year. This seminar, "Practical Clinical Management: Drug Abuse Education for the Primary Care Physician," was held October 20 and 21, 1990 at the Baltimore Convention Center and was well-attended.

The Committee continues to strive to maintain a balance between educating physicians about their prescribing practices and supporting discipline for those who abuse these privileges.

The Chairperson appreciates the continued dedication and commitment of members and staff to the education of physicians in this important aspect of their practice.

*Nelson G. Goodman MD, Chairperson*

*Harbhajan Ajrawat MD  
George H.A. Bone MD  
Lewis H. Dennis MD

Patrick J. Sheehan MD  
John R. Smith MD*

*Nelson G. Goodman MD (r) thanks Reynaldo L. Lee-Uacer MD for his Certificate of Appreciation as Chairperson of Med Chi's Committee on Drugs*

## Emergency Medical Services Committee

*Mr. President and Members of the House of Delegates:*

The Committee on Emergency Medical Services (EMS) is pleased to report that it conducted three meetings during the report period. A number of subjects, including legislative bills affecting emergency medicine, were discussed and acted on. The major areas of significance are discussed below.

### ■ Emergency Department Overcrowding

The issue of emergency department (ED) overcrowding was carried over from the prior year because of the Maryland Chapter, American College of Emergency Physicians (MD ACEP) survey which found overcrowding in 75 percent of Maryland hospitals. During this reporting year, additional meetings were held involving the Maryland Institute for Emergency Medical Services System (MIEMSS), MD ACEP, the Emergency Nurses Association (ENA), the Maryland Hospital Association (MHA), and several hospital administrators.

MD ACEP and ENA conducted another survey, the results of which were shared at the May meeting. Committee member, Ameen I. Ramzy MD, is analyzing "by-pass" data. Available information was reviewed at the May meeting.

In general, the new survey indicated a reduction of overcrowding. This may be the result of actions taken based on the first ED Overcrowding Survey. The Committee will continue to study this issue.

### ■ Health Maintenance Organization Agreement on Managed Care

Although time constraints did not allow for its public release, the Committee was successful in getting the Conjoint Managed Care Task Force's Health Maintenance Organization (HMO) Agreement finalized and approved by the Med Chi Council and Executive Committee. However, the HMO Agreement must be revised to incorporate regulatory requirements of bills just passed during the 1991 Legislative Session. This will be one of the charges for the Committee next year.

### ■ Emergency Medicine Legislative Issues

There were approximately eight bills directly affecting emergency medicine and a half dozen others of lesser concern. The Committee witnessed and participated in a strenuous campaign with MD ACEP to help enact favorable

emergency medicine legislation. Ultimately, four bills passed the Senate and the House and were forwarded to the Governor for signature. They are: SB 317/HB 416 - HMO Prompt Payment; SB 701 - HMO Subscribers; and SB 1120 - Basic Insurance Benefits Policy. It is important to note that HB 567 (Mandatory Assignment) was defeated.

Theodore E. Harrison MD (l), President of the Maryland Chapter of the American College of Emergency Physicians, presents the Emergency Medicine Journalism Award to Daniel Kohn MD

## ■ MIEMSS Director Search

The Committee has learned of the intent of the President of the University of Maryland at Baltimore to form a Search Committee to replace the current Director at the completion of his term of office. Because of the importance of this position to the practice of emergency medicine, the EMS committee is seeking representation on the Search Committee. The Committee has communicated its intent to the President of the University.

Other issues reviewed and discussed include:

- The role and influence of Med Chi versus MIEMSS.
- Medicare audits and the reimbursement policy for comprehensive exam billing as it pertains to emergency medicine.
- Access to care for the elderly.
- Motorcycle helmet legislation.
- EMS protocols.
- Disaster planning in light of ED overcrowding.
- Interface problems with managed care plans.

- Dangers of the extrication process.
- Emergency medicine article for the *Maryland Medical Journal*.

It has been my pleasure to serve Med Chi as the Chairperson of this Committee.

*Peter M. Fahrney MD, FACEP, Chairperson*

*Barbara J. Bach MD*

*Alexander P. Cadoux MD*

*Randy S. Ellis MD*

*Sergio B. Mateo MD*

*Ameen I. Ramzy MD*

*Walter L. Scheetz MD*

*Michael A. Stang MD*

*Lawrence F. Blob MD*

*John B. DeHoff MD*

*Jeffrey L. Fillmore MD*

*William K. Mysko MD*

*Bradford A. Ross MD*

*Keith T. Sivertson MD*

## Finance Committee

*Mr. President and Members of the House of Delegates:*

The Finance Committee met three times to develop the 1991 budget. The budget is much more sophisticated than in the past. In addition to the estimated total income and projected expenditures for the entire organization, departmental budgets were prepared. Also, a program budget was included as part of the entire plan of revenue and expenditures.

The Bowman Financial Management Company continues to manage the investment portfolios. The market values of the investments as of December 31, 1990 were as follows:

Consolidated Fund	\$1,720,215
Steiner Fund	\$ 819,502
Pension Fund	\$1,147,382

There was a great deal of volatility in the equity markets in 1990. All of the market indices showed a negative change for the year. Our portfolios were down, but not to the extent of the individual market indices.

The Faculty remains in a solid financial condition and the outlook for 1991 is very positive.

*Lawrence H. Fink MD, Chairperson*

*Albert M. Antlitz MD*

*Francis C. Mayle, Jr. MD*

*Gerald A. Glowacki MD*

*Jose M. Yosucio MD*

## Focused Professional Education Committee

*Mr. President and Members of the House of Delegates:*

**O**n March 21, 1991, the Med Chi Council voted to recommend to the Bylaws Committee the establishment, as a standing committee, of the Focused Professional Education Committee. Med Chi has charged the Focused Professional Education Committee with the creation of a process through which information gathered in the course of peer review activities by the Faculty, by hospitals, and by specialty organizations, may be used to create a network of effective focused medical education. Through this network, information in peer review reports, rather than being used for purely punitive purposes, can be used to *benefit* physicians. The Committee's program will serve as a resource for physicians who wish to preserve their licenses and improve their care of patients. The program will focus on the identified deficits in a physician's practice, assess the physician's needs, and address those needs through specific, individualized, educational activities. To accomplish this, the Committee will solicit the involvement of specialty societies.

Both the Faculty and the Focused Professional Education Committee are fortunate to have the volunteer services and advice of Edward J. Kowalewski MD, Professor Emeritus, Department of Family Medicine, University of Maryland. Since 1974, Dr. Kowalewski has directed a focused education program at the University of Maryland, serving over 500 physicians. Under Dr. Kowalewski's guidance, the program at Med Chi will continue to plan and monitor educational programs. The information gathered during and at the conclusion of each course will be used to make improvements in the program and to prepare periodic reports on how a physician has improved his or her practice -- for that will be the final measure of the program's success.

*Ronald J. Cohen MD, Chairperson*

*Pablo E. Dibos MD*

*Jesse M. Hellman MD*

*David S. McHold MD*

*Karakat S. Gokulanathan MD*

*Edward J. Kowalewski MD*

*Sidney B. Seidman MD*

## Committee on Hospital Medical Staffs

*Mr. President and Members of the House of Delegates:*

**T**he Committee on Hospital Medical Staffs, whose membership includes representation from hospital medical staffs throughout the State, is expected to consult with the Maryland Department of Health and Mental Hygiene (DHMH), medical staffs, professional liability insurers, and the Maryland Hospital Association regarding quality assurance and risk management programs, complaint investigations, and any other matters concerning the establishment of medical standards in hospitals, as well as hospital legal issues including medical staff bylaws.

This involvement with hospital medical staff bylaws exposed the Committee to a JCAHO (Joint Commission for the Accreditation of Healthcare Organizations) standard violation wherein coordination in developing the bylaws did not occur.

Allegedly, the Hospital Administration at Springfield Hospital Center had unilaterally developed hospital staff bylaws which were adopted by the hospital. Consultation and mediation with the hospital medical staff and the administration were unsuccessful in resolving the issue. Consequently, in cooperation with the American Medical Association (AMA) and through the efforts of the Committee, an amicus curiae brief was filed in the Court of Special Appeals of Maryland in support of the Springfield Hospital Medical Staffs' position. This brief received wide distribution and was specifically made available to the JCAHO survey team that conducted a Commission survey in July 1990. Although the hospital received JCAHO accreditation, the Committee, with the help of Med Chi's AMA delegation and the AMA Joint Commissioners, continued to pursue this issue and was instrumental in a re-evaluation of this issue during a focus survey conducted in March 1991.

At the time of the preparation of this report, the results of this survey were not available.

Other issues in which the Committee has become involved are:

- Legal Services for physicians under Professional Review Organization (PRO) or Board of Physician Quality Assurance (BPQA) review.
- Guidelines for hospital medical staff bylaws.
- Hospital medical staff drug-testing.

- DHMH licensing and certification surveys of hospitals.
- Peer review confidentiality.
- Economic credentialing and the awarding of hospital privileges based on procedures, cases, and admissions.
- MIEMSS (Maryland Institute for Emergency Medical Services Systems) Shock Trauma Center and its problems related to staff appointment and the University of Maryland academic appointment system.
- Healthcare Credentials Verification, Inc. (HCV) application questionnaires.
- Use of hospital resources for entrepreneurial ventures.
- Medical Miranda warnings (Patient Self-Determination Act), i.e., the requirement to advise patients of their rights to refuse care and to name proxies in case they become incompetent.

The Committee has been charged by Council with Med Chi's oversight responsibility for Healthcare Credentials Verification, Inc. As the House of Delegates is aware, this organization, which provides a centralized credentialing service for hospital medical staff members, was jointly organized by Med Chi and the Maryland Hospital Association. The Committee was actively involved in assuring that HCV application forms included only those questions pertinent in providing information related to federal and state law or JCAHO standards.

As Chairperson, I wish to express my sincere appreciation to the members of the Committee for their dedication and commitment. On behalf of the Committee, I would like to thank the Executive Committee and the Council for their continued support and encouragement.

## Immunizations and Infectious Diseases Subcommittee

Mr. President and Members of the House of Delegates:

The Immunizations and Infectious Diseases Subcommittee aggressively addressed immunization issues during 1990-1991.

Committee members discussed and reviewed the recommendations of the American Academy of Pediatrics and the Advisory Committee for Immunization Practices, as well as the policy of Maryland's Department of Health and Mental Hygiene (DHMH). As a result of these efforts, the Subcommittee was instrumental in encouraging Med Chi to adopt the position that a second dose of the measles-mumps-rubella (MMR) vaccine be given to all children age twelve with the option to give the vaccine to younger children ages four through six. Information concerning this recommendation was disseminated to physicians in the *Maryland Medical Journal*.

Further efforts of the Subcommittee focused on the devastating effects of *Haemophilus influenza* on very young children. After an extensive discussion and review of all the available data including information concerning licensed vaccines by Lederle and Merck, Subcommittee members were able to formulate a recommendation concerning immunization of young children which Med Chi adopted and published in the *Maryland Medical Journal*. Specifically, the Subcommittee made recommendations incorporating vaccination for *Haemophilus influenza* into the well-baby schedule and providing for immunization with either of the two licensed *Haemophilus influenza*, type B (HIB) vaccines produced by Lederle and Merck.

The Subcommittee is committed to pursuing immunization and infectious disease issues and channeling its efforts in the areas of educating, informing, and updating physicians on these critical issues.

## Laboratory Regulations Subcommittee

*Mr. President and Members of the House of Delegates:*

A Subcommittee to the Public Health Committee was appointed to study Maryland's laboratory regulations during the 1990-1991 year.

The Subcommittee was given the charge to evaluate the regulations concerning physician office and other point-of-care laboratories and submit recommendations to the Public Health Committee for presentation to the Executive Committee. There were seven physicians appointed to this Subcommittee. These physicians specialized in Internal Medicine, Family Practice, Hematology, Oncology, Pediatrics, Cardiovascular Diseases, Infectious Diseases, and General Preventive Medicine.

After a careful review of the physician laboratory regulations (Physician Office and Other Point-of-Care Laboratories, COMAR 10.10.06) and a review of comments submitted by Med Chi physicians, the Subcommittee determined that the Maryland laboratory regulations were unreasonably expensive and cumbersome and should be greatly simplified. To this end, the Subcommittee did a section-by-section revision of the regulations. Three sections of the regulations were not specifically revised since the Subcommittee felt that more expertise was required in subspecialty areas not represented on the Subcommittee.

The Subcommittee found that the amount of recordkeeping, documentation, and number of controls and calculations required by the regulations were unduly burdensome and the effect of the regulations would be to reduce vastly the number of physician office practices that could afford to perform laboratory work for patients. Therefore, accessibility to timely, efficient diagnosis and treatment would be significantly decreased. Furthermore, this situation would force physicians to send significantly ill patients for emergency room evaluation, thus increasing medical costs.

All of the Subcommittee's recommendations were submitted to the Public Health Committee, which strongly supported the recommendations and presented them to the Executive Committee. The Executive Committee approved of the recommendations and forwarded them to Jack DeBoy DrPH, Assistant Director, Laboratories Administration, Department of Health and Mental Hygiene (DHMH), for his department's consideration. Further-

more, Med Chi's Council demanded that full implementation of the laboratory regulations be withheld until a more reasonable and fair method of inspection and certification could be devised.

It was of particular concern to the Subcommittee and Med Chi's Council that the DHMH Laboratory Advisory Committee did not adequately address the realities of small office medical practice when it promulgated the laboratory regulations. Furthermore, the Subcommittee questioned excessive regulation in light of the fact that there was no published evidence of patient harm from simple office testing.

The Subcommittee is still a viable committee that is continuing a dialogue with DHMH about the laboratory regulations and the health care needs of the citizens of Maryland.

The Subcommittee would like to express its appreciation for the support and guidance provided by the Public Health Committee and the Executive Committee.

## Legislative Committee

*Mr. President and Members of the House of Delegates:*

**D**uring 1990-91, the Legislative Committee worked on many significant issues and supported the passage of public health measures while opposing extensive governmental interference in medical practice. An overview of legislation on which the Committee worked to pass or defeat on behalf of Med Chi physicians and their patients is summarized here.

### ■ Public Health Issues

**Smoking.** The medical community lent its full weight to efforts by the Maryland Coalition on Smoking or Health to push legislation aimed at preventing young people from becoming smokers. The Medical and Chirurgical Faculty joined the American Cancer Society - Maryland Division, the American Heart Association - Maryland Affiliate, and the American Lung Association of Maryland in an effort to increase the excise tax on cigarettes and to prohibit or limit the sale of cigarettes by vending machines. Senate Bill 454, "Tobacco Health Protection Fund," would have increased the State excise tax by 20 cents per pack (one cent per cigarette). It was expected that this would result in a comparable decrease in first-time smokers while raising eight million dollars in new revenue, much of it earmarked for health education programs. However, with many new legislators elected on "no new taxes" platforms, few expected any meaningful tax increases to pass.

Nonetheless, with additional pressure from Maryland physicians, the Legislature voted to increase the excise tax for the first time in ten years (by three cents per pack) and also to apply the State sales tax to cigarettes. Although the bill was amended to eliminate the dedication of funds to health education programs, the result will be at least a ten-cent increase in a pack of cigarettes and an expected decrease in new, young smokers.

Efforts to restrict minors' access to cigarettes did not fare as well. Five bills failed in committee despite testimony from voluntary health organizations and many physicians. HB 39 would have required the use of tokens in cigarette machines, HB 662 and SB 625 would have imposed restrictions on the location of cigarette vending machines, while HB 663 would have banned sales by vending machines altogether. HB 673 would have made vending machine operators criminally liable for sales to minors, just as any over-the-counter vendor is currently

liable. The Coalition is expected to renew its efforts next year to limit cigarette access to minors.

**Mandated Benefits.** In support of its specialty societies, Med Chi testified in favor of two proposals to require insurance carriers to cover specific medical procedures. As passed by the General Assembly, HB 407 and SB 749 will require coverage for mammography screening beginning with a baseline mammogram for women between the ages of thirty-five and thirty-nine, then every two years for women between the ages of forty and forty-nine, and annually for women fifty years of age and over. As originally introduced, HB 407 would have required any physician performing mammography after July 1, 1991 to be accredited by the American College of Radiology (ACR). This legislation has been introduced for the past four years in various forms and Med Chi has opposed it each year. As amended, HB 407 recognizes ACR accreditation as a valid form of quality assurance but also recognizes Health Care Financing Administration (HCFA) accreditation, as well as accreditation by a program yet to be developed by Med Chi in conjunction with the Maryland Radiological Association and the Department of Health and Mental Hygiene (DHMH).

Another series of bills failed in committee, despite approval by the Governor's Commission on Mandated Benefits and testimony by Maryland physicians. House Bill 801 and Senate Bills 505 and 724 would have mandated coverage for preventive child wellness services, including immunizations and office visits up to a specific age.

**Patients' Rights.** The General Assembly passed two major pieces of legislation affecting individuals' rights in health care settings while defeating a third in committee. First, HB 588 revises the current procedures that mental health facilities use to override a patient's refusal of medications. In a recent decision, Maryland's highest court found the existing procedures to violate the requirements of due process. This bill corrects the law to conform to the Constitution.

The Legislature this year passed a compromise abortion bill early in the Session, avoiding a lengthy filibuster like the one in 1990 that interfered with the passage of other important legislation. While Med Chi took no position on Senate Bill 162, it did provide information requested by the committee regarding the affect of abortion statutes on medical practice. The new law, as signed by the Governor, essentially repeals statutes that appear to violate the U.S. Supreme Court decisions that followed *Roe v Wade*, giving women a right to be free from government interference in choosing to terminate a first-trimester pregnancy. It also allows a physician to avoid parental

During the 1991 Annual Meeting at College Park, J. David Nagel MD thanks Med Chi members for electing him Med Chi President for 1991-1992.

notification prior to a minor's abortion if the physician determines the minor is "mature and capable of giving informed consent" or that notice "would not be in the best interest of the minor." Left open by the bill is whether a health care provider who refuses to perform an abortion may be held liable for failure to refer a patient to another provider who would.

The patients' rights bill that failed, SB 250, would have established minimum requirements for a patient to execute a durable power of attorney for the purpose of designating who can make health care decisions in the event he or she becomes disabled. The bill would have legitimized durable powers of attorney currently in use and would have given immunity to health care providers who follow the direction of such a document. Opponents claimed that such a law was unnecessary, since the Attorney General has already issued an opinion that such powers of attorney may be executed even without a statute in effect.

**Other Proposals.** Two other public health initiatives were defeated this year. HB 197 would have placed responsibility on parents to assure that firearms in the home were safely kept out of children's hands. Due to extensive pressure from the gun lobby, this measure was defeated in committee. Also, efforts to reinstate the prior law requiring motorcycle helmets (SB 130/HB 31) or protective headgear (HB 32) went down to defeat once more.

## ■ Medical Practice Issues

**AIDS.** Two important bills were introduced this year that related to the testing of individuals for the human immunodeficiency virus (HIV). Working with Senator Paula Hollinger, Med Chi was able to amend one bill to conform more closely to legislation Med Chi had proposed. Med Chi worked hard to defeat or modify the other bill.

HB 1156 would have required physicians to be tested periodically for the presence of HIV and to report their status to appropriate credentialing and licensing bodies. This legislation came in the wake of the situation at The Johns Hopkins Hospital in which a physician who subsequently died of Acquired Immunodeficiency Syndrome (AIDS) had been performing surgical procedures on various patients. This legislation was defeated in committee largely because of an amendment that was placed on the following bill, SB 203.

As passed, SB 203 allows for testing of certain individuals without informed consent using substituted consent as provided by certain Maryland statutes. The legislation further provides that the Med Chi Faculty, in consultation with the Centers for Disease Control (CDC), the Maryland Hospital Association (MHA), and DHMH, shall develop a practice protocol for physicians infected with HIV and report this practice protocol to the General Assembly on December 2, 1991.

**Immunity from Liability.** HB 1090, a very important piece of tort reform, provides that a physician for a sports program is not liable for any act or omission resulting from the rendering of services unless the act or omission constitutes willful or wanton misconduct, gross negligence, or intentionally tortious conduct.

**Physician Discipline.** Several bills were proposed that would have affected the State regulation of medical practice. As proposed, HB 678 would have stripped the Board of Physician Quality Assurance (BPQA) of its ability to discipline a physician for medical practices and procedures that are clearly outside accepted scientific thought and practice. The legislation was proposed by several physicians currently under investigation and review by the BPQA for questionable medical judgment. The hearing for this legislation lasted for over four hours and more than 203 witnesses testified in favor of the bill including former Secretary of the Department of Health and Mental Hygiene, Neil Solomon MD. Although Med Chi was the only health care group to testify against the legislation, the bill was defeated in committee.

As proposed, HB 876 would have established new disciplinary grounds for disciplining physicians who have sexual relations with their patients under various circumstances. Unfortunately, the way this legislation was drafted, a physician who happens to treat his or her spouse would likewise be prohibited from having sex with him or her during treatment or for as much as a year after treatment has ceased. Under intense pressure from physicians, the sponsor withdrew the legislation.

Another bill will significantly increase the resources that the BPQA will have available to handle its case load. As

passed, SB 579 establishes a Board of Physician Quality Assurance Fund and a Board of Nursing Fund in the State Treasury, the funds of which are to be used exclusively to cover the actual, documented, direct, and indirect costs of fulfilling the responsibilities of the BPQA and the Board of Nursing. All of the fees collected by the Board of Nursing and the BPQA (with the exception of those collected for the Physician Rehabilitation Program of Med Chi) are to be turned over to the Comptroller, who will then place 20 percent in the State's general fund, and the remainder in the Funds of the respective Boards. The Funds are continuing and nonlapsing; monies remaining in these Funds at the end of the fiscal year will not revert to the general fund but may be carried forward to the next year for the Boards to use. The Funds will be administered by the Chairpersons of the respective Boards.

*Office Practice Issues.* Three major bills impacting on physician office practices were introduced this Session.

During the 1990 General Assembly Session, legislation passed the House Environmental Matters Committee that would have prohibited a physician from referring patients to any entity in which the physician had a substantial financial interest. In an effort to prevent a prohibition bill from passing the 1991 Maryland General Assembly, Senator Paula Hollinger and the Health Subcommittee of the Senate introduced SB 169 requiring all health care providers to disclose the existence of the ownership of a significant beneficial interest, inform the patient that the patient may use another provider of such services, and require the patient to acknowledge in writing receipt of the statement. As drafted, this legislation is largely in conformance with the American Medical Association (AMA) and Med Chi ethical policies on referral of patients.

Two bills were introduced this Session that would have affected physician prescribing practices.

HB 1210 would have required physicians to use a pad with different colors for prescribing Schedule II, III, and IV drugs. As amended by the sponsor, SB 193 would have required the use of a serialized pad when prescribing Schedule II drugs. This is its second appearance in as many years before the Maryland General Assembly. The Senate bill was amended heavily in committee and, ultimately, was re-referred back to committee by Senator Hollinger for summer study. The house bill was killed in committee after the Senate action.

HB 408 presented an opportunity to correct a particularly intrusive and potentially damaging regulation of x-ray services offered by physicians in their offices. Regulations were promulgated which would have certainly abolished most forms of x-ray services offered by family

President Reynaldo L. Lee-Llacer MD (left) presents Lieutenant Governor Melvin A. Steinberg MD with a Certificate of Appreciation. Med Chi also presented the Lt. Gov. with the Dr. Henry & Page Laughlin Citizen of the Year Award.

practitioners and internists. The new regulation would have virtually required all physicians to employ radiation technologists to perform even the simplest x-rays. Although promulgated by DHMH, the BPQA ultimately drafted the regulation. An amendment to HB 408 directs the BPQA to work in conjunction with Med Chi in the creation of a new limited class of x-ray assistant who may perform simple x-rays under the direct supervision of a physician. This new class of assistant will assure access for patients who need basic radiological exams in a physician's office. The BPQA is further required to report back to the Senate Finance Committee and House Environmental Matters Committee by December 2, 1991 with a full description of this category so that legislation can be drafted and ready for introduction in the 1992 General Assembly.

*Other Health Care Providers.* The medical community also dealt with several issues relating to other types of health care providers. In each, Med Chi was able to assure that reasonable measures were enacted to protect the health and welfare of patients.

The purpose of SB 501 was to correct an unreasonable provision in the existing law relating to physician assistants. Currently the law requires a physician to sign any diagnostic orders by a physician assistant within twenty-four hours. The new bill will allow the supervising physician forty-eight hours to countersign these orders. This legislation rectifies the only major problem in DHMH-proposed regulations governing physician assistants identified by both the medical community and the physician assistants organization.

After HB 676 was defeated on the floor of the House, Senator Hollinger moved SB 428 out of the Senate to the House Environmental Matters Committee. The bill sat in committee until the last days of the Session. After it was

heavily amended, the bill passed the Assembly on the very last day. However, due to the lack of consensus in the orthopaedic community, the Governor decided to veto the bill. The bill expanded the scope of podiatry practice in hospitals and freestanding surgical centers, but required hospital credentialing of the podiatrist for the expanded procedures. Additionally, the bill allowed hospitals to approve the training program attended by the podiatrist.

HB 1211 was proposed by chiropractors who desired to be renamed Chiropractic Physicians. Even though the bill had the sponsorship of a chairperson of a major committee in the House of Delegates, it was defeated overwhelmingly in committee. The proponents have pledged to bring this legislation back.

As drafted, HB 1087 would have increased the role of non-physician acupuncturists. Additionally, the bill would have abolished the current requirement of physician supervision of patients seeking acupuncture as a treatment. The bill was defeated, although the non-physician acupuncturists intend to bring the measure back to the next General Assembly.

*Physician Fee Regulations.* Five major attempts to regulate physicians' fees were defeated after intense efforts by the physician community.

Last year during the 1990 Maryland General Assembly, a coalition, comprised of the Maryland Chamber of Commerce and the Maryland State and District of Columbia AFL-CIO, proposed legislation to include radiologists, anesthesiologists, and pathologists under the regulatory net of the Health Systems Cost Review Commission (HSCRC). This legislation was defeated. This year, this very same coalition brought two pieces of legislation forward. SB 700 would have studied the prospect of placing all hospital-based physicians under the HSCRC for purposes of fee regulation. Even though the legislation was limited to hospital-based physicians, the coalition made it quite clear that ultimately it would like to see all physicians controlled by the HSCRC. This legislation was defeated in the Senate Finance Committee. However, the coalition continues to be aggressive about its intent to control physicians' fees and intends to conduct a study this summer, paying for the study out of its own coffers.

SB 742 would have established a state agency to monitor and catalogue physicians' fees as well as their individual practice patterns. This bill was supported not only by the Chamber of Commerce and the AFL-CIO but by the Governor's Commission on Health Care Policy and Financing. SB 742 was also defeated in the Senate Finance Committee.

HB 567 would have instituted Mandated Medicare Assignment for all services offered in an emergency room

setting. This legislation is similar to mandated assignment bills introduced over the last four years, although it was limited in scope. The bill was soundly defeated in committee but it promises to be a recurring legislative theme.

Had it not been defeated in committee, HB 54 would have prohibited the Workers' Compensation Commission from ordering payment of medical bills unless the provider submitted a medical report, an itemized bill, and a request for payment in accordance with the Commission's *Medical Fee Guide*. While seemingly innocuous, the bill would have established a statutory basis for the Commission's current position that its *Fee Guide* is, in fact, a "cap." Another bill that failed, SB 263, would have allowed the Workers' Compensation Commission to revise its *Medical Fee Guide* periodically instead of every two years as is currently required.

### ■ Health Care Financing

*HMO Issues.* As introduced, SB 701 would have clarified that the prohibition on health care providers billing HMO subscribers for covered services applies only to providers under contract with the HMO.

However, during the debate on this issue, the Attorney General's office expressed strong concern over the consumer impact of such legislation. In response to this concern, the General Assembly adopted amendments requiring HMOs to pay noncontracting providers for covered services rendered pursuant to a written or verbal authorization by the HMO or a provider under contract with the HMO, in accordance with the prompt pay requirements and at the noncontracting provider's usual, customary, and reasonable rate. If the HMO's normal payment to contracting providers for the covered service is different (i.e., lower), the HMO would be responsible for collecting the difference from its own subscriber. In addition, the amended bill:

- subjects HMOs to the Unfair Claims Settlement provisions of Article 48A;
- clarifies that the "hold harmless" provision applies to subscribers of HMOs issued a Certificate of Authority in Maryland;
- requires providers, at the request of the HMO, to provide certain summary documentation supporting the claim; and
- provides that certain penalties for violations of these provisions apply.

As passed by the Legislature, SB 317/HB 416 requires HMOs to pay provider claims within thirty days of the receipt of a claim and, if the HMO does not comply, to automatically pay 1.5 percent interest monthly on the

unpaid balance. The interest penalty may be waived only if there is a good faith dispute regarding the legitimacy of the claim or the appropriate amount of the claim, and the HMO: (1) notifies the provider within fifteen days of receipt of the claim that the claim is disputed and the specific reasons for the dispute, and (2) pays any undisputed portion of the claim within thirty days.

HB 1263 requires that an HMO entering into an "administrative service provider contract" or a capitation agreement with any entity is ultimately responsible for payments to a provider who is not a party to the contract and renders covered health care services to a subscriber pursuant to a referral by the contracting entity. This legislation is designed to address the problem resulting from the failure of some physician groups under capitation agreements to pay for referral services rendered by other noncontractual health care providers.

*Insurance Issues.* Beginning January 1, 1992, SB 633/HB 803 expands the existing prompt pay requirements for insurers by requiring insurers:

- to either pay the claim within thirty days or send a "Notice of Receipt and Status of Claim" within thirty days of receiving a claim stating that the insurer refuses to pay the claim and stating the specific reason, or indicating that the insurer requires further specific information to make a determination on reimbursement;
- to automatically add the interest penalty for claims paid more than thirty days after the receipt of the claim; and
- to pay the undisputed portion of a claim within thirty days in order to qualify for the waiver of the current interest penalty for the disputed portion of the claim.

HB 618 builds on the existing prompt pay requirements for insurers by establishing progressively higher interest penalties for late payments. Under the bill, claims unpaid from 31 to 60 days after submission are subject to a 1.5 percent interest penalty; from 61 to 120 days a 2 percent interest penalty per month; and from 120 days and beyond a 2.5 percent monthly interest penalty. Consequently, a claim unpaid a year after submission would be subject to a 28 percent cumulative interest penalty.

SB 77 requires that all health insurance plans delivered in this State be provided in simplified language and approved by the Insurance Commission for compliance with simplified language standards. Regulations are to be adopted and consistent with the Life and Health Insurance Policy Language Simplification Model Act.

HB 1120 waives mandated health insurance benefit

laws and authorizes insurers to provide a limited benefits policy to individuals who have not been covered by any health insurance plan for the thirty-four-month period preceding the date of application and who are not eligible for coverage under Medicare and, on a group basis, to an employer with at least two but no more than twenty-five full-time employees. The bill limits the availability of this policy to individuals and groups to no more than three years, unless the General Assembly fails to enact a transition plan to assist employers in providing more comprehensive benefits.

The policy must provide at least:

- hospitalization coverage for either the first ten days of inpatient hospital and professional services per year whether for mental or physical illness, or the first ten days of inpatient hospital and professional services limited to physical illness only;
- ten office visits with a licensed health care provider;
- reasonable coverage of prenatal care;
- reasonable coverage of obstetrical care;
- reasonable coverage of medically necessary hospital emergency room care using the American College of Emergency Physicians (ACEP) definition of emergency;
- newborn childcare from birth; and
- preventive services.

The bill also calls for the development of small business health market reform that would limit medical underwriting and certain rating practices.

As introduced, SB 409/HB 342 would have required private utilization review agents to disclose their criteria for denying payment of medical care claims. While this provision was deleted from the bill before it passed, the amended version still contains a prohibition against a private review agent making referrals to a health care provider in which it has an interest.

Another bill worthy of consideration was SB 413, which would have prohibited a nonprofit health plan from charging a provider a processing fee if the claim is processed electronically. Under intense pressure from the insurance industry, the bill was defeated in committee.

Characterized in the press as a Medicaid "scam," HB 842 was intended to fund a sixty million dollar deficit in the Medicaid budget largely caused by federal cut-backs. Rather than impose cuts in payments to providers for care of Medicaid patients, the DHMH opted to double the amounts paid to providers, then take

back the surplus by means of a provider tax. The effect is to shift more of the financial burden back onto the federal government's matching funds without affecting the providers' net payment. Physicians will not have to change the amount they bill Medicaid, since they are now required to bill their usual and customary rate. Should this financing mechanism be repealed or declared invalid, the provider tax automatically terminates.

## Library and History Committee

*Mr. President and Members of the House of Delegates:*

**D**uring 1990-1991, the Library and History Committee met eight times. Three major issues were identified and addressed. They were: (1) the condition and value of the Faculty's rare book collection; (2) the implementation of a program to recruit physician volunteers to catalog the rare book collection; and (3) the development of a plan to publish a book on the history of medicine in Maryland for the Faculty's bicentennial in 1999.

Other issues addressed by the Committee included the updating of the library's gift donation policy, a review of the library's tax status regarding donations, issues related to the rental of the Louis A. Krause Room, ongoing projects with the Maryland Science Center, preliminary work on remote access to literature searching for members, and a comprehensive usage study of the library's journal collection.

### ■ Condition and Value of the Faculty's Rare Book Collection

In 1990, the Executive Committee requested a joint report from the Library and History Committee and the Finance Committee on how to best capitalize on the history of medicine collection. Dr. Nancy Nichols, on behalf of the Library and History Committee, issued a report on the condition of the Faculty's 10,000 volumes of medical texts published before 1900 and the 7,500 pre-1900 medical pamphlets in the collection. An estimated monetary value of the collection was included based on the condition of the books and the rare book selling market. Dr. Nichols also highlighted the recently implemented preservation policy for the collection, as well as future plans for its computerization.

### ■ Physician Volunteer Project

The Committee finalized plans with the library staff for the recruitment of senior physicians to volunteer their services to enter the rare book collection into the Faculty's computerized book catalog. During the summer, a notice was placed in the *MMJ*, and a letter seeking volunteers was sent by the Committee to emeritus members in the Baltimore area.

Over fifteen members expressed interest. They met with the library staff for two full days to receive instructions on cataloging. Thereafter, they met for four hours every other week and cataloged books into the collection under the supervision of Ms. Susan Harman, the Faculty's

Associate Librarian. The Committee recognizes the great amount of work needed to complete this project and will seek additional volunteers this summer.

### ■ Bicentennial Book Project

The Committee, after detailed discussions and an interview with a local medical author, submitted a recommendation to the Executive Committee that the Faculty form an Ad Hoc Bicentennial Publication Committee. This Committee, comprised of members from various other Faculty committees, would work to guide the project to completion.

The Executive Committee approved the recommendation in principle and asked the Library and History Committee to provide a financial statement with respect to the cost of this project. The Committee, led by Dr. Ronald Fishbein, met with local medical publishers and authors to discuss the financial arrangements for this work. At the end of the year, Dr. Fishbein, with the Committee's approval, drafted a financial report on the cost of the project.

The Committee is also pleased to report that one local book publisher has expressed serious interest in publishing this work.

### ■ Goals for 1991 - 1992

The Committee hopes to complete its work on the bicentennial book project early in the year and it will begin recruitment of additional volunteers for the cataloging project. The Committee plans to submit an article to the *MMJ* for publication consideration describing the work of the volunteers. The summer will also see the Committee complete work on the journal usage study.

The Committee hopes to develop to full-term the library's capabilities to provide the membership with remote access information. The Committee also plans to develop a closer relationship with the Maryland Science Center with respect to medical exhibits in the 1990s.

The Committee wishes to extend its thanks to Med Chi staff for their hard work and their cooperation with the Committee, and to Committee members for their cooperation, enthusiasm and support of the library. A special thanks goes to the commuting members of the Committee.

## Committee on Long-term Care and Geriatrics

*Mr. President and the Members of the House of Delegates:*

**T**he Committee on Long-term Care and Geriatrics met seven times during the 1990-1991 year to discuss topics related to long-term care and geriatric medicine.

Continuing its long-standing commitment to assuring the highest quality of care in long-term care facilities, the Committee concentrated its focus on establishing medical quality assurance guidelines in long-term care institutions. By means of a summer 1991 survey to nursing home medical directors, alternates, and members of the academic community, the Committee hopes to establish a statewide consensus on the minimum standards of care in nursing home medicine, enhancing the quality of medical care delivered in nursing homes. The survey addresses: standardization of documentation of mandated doctor/patient interactions; clarification of responsibilities by the medical staff for purposes of quality assurance, and license and certification surveys; and documentation necessary for a re-evaluation or for reimbursement for services.

The Committee cosponsored a scientific session with the Alzheimer's Association of Central Maryland at the 1991 Annual Meeting of Med Chi. The session was titled, "Alzheimer's Research and Resources in Maryland," and was designated as the Jesse C. Coggins MD Memorial Lecture. Attendance and response were very good.

The Committee looks forward to the coming year and will strive to provide appropriate education to physicians and the public. The Chairperson appreciates the dedication of the Committee members and the Med Chi staff.

## Committee on Managed Care and Third Party Liaison

*Mr. President and Members of the House of Delegates:*

**T**he Committee on Managed Care and Third Party Liaison was successful in bringing to resolution a number of key issues or grievances of long and short-standing. Major issues confronting the Committee included:

- *Delayed payments by health maintenance organizations (HMOs) and third party carriers.* This issue was resolved by legislation in which an interest penalty applies when clean bills are not paid within thirty days.
- *Prohibition of health care providers from billing any patient subscriber to an HMO.* Legislation was successfully introduced to provide for the billing of patients who voluntarily seek services outside of their HMO and for non-covered services of HMOs.
- *Global health policy by the Health Care Financing Administration (HCFA).* This policy resulted in a ground swell of objection based on the failure to differentiate between services provided for a defined entity and repeated services that may be required by a chronic or ongoing illness. HCFA has accepted Med Chi comments and agreed to further study the regulation to address the issues raised.
- *Independent third party peer review.* Third party carriers' determination of reasonable compensation based on internal or consultative appropriateness review was challenged on the basis of the arbitrary creation of a "board of quality assurance" which is not a recognized board of the American Medical Association (AMA), as well as other shields behind which third party carriers have avoided meeting their fiduciary obligations. The issue has been referred to legal counsel for assistance in challenging such artificially created entities.
- *Established guidelines for physicians joining HMOs or other managed care contracts to avoid egregious clauses.* This issue was referred to legal counsel to provide guidelines for such contractual arrangements, including third party carrier contracts prohibiting providers from billing patients until such time as their primary and secondary insurance pays for services; this prolongs provider compensation.

The issue will be addressed with medical directors of third party carriers and Medicare.

- *Individual grievances concerning failure to pay or delay payments.* In most instances, providers registering complaints had not exhausted standard appeal mechanisms and were specifically advised to do so.
- *The need for updating fee schedules from third party carriers.* This issue was referred to medical directors of Blue Shield and Medicare for consideration. A major responsibility of the Committee was met by participation in the HCFA regional meeting to alert physicians to changes in fee policy and regulations, including the global policy previously described. A significant accomplishment of the Committee has been the establishment of a much better relationship between the Med Chi Faculty and the medical directors of Blue Shield and Medicare.

## Physician's Practice Digest

During the past year, in an effort to improve communications and widen the scope of member services, Med Chi developed a new publication, Physician's Practice Digest. Issued quarterly, PPD features information related to medical practice management. The reaction to PPD has been overwhelmingly positive within Maryland as well as around the country. The publication won the 1990 Sandoz Pharmaceutical Award for Excellence in Medical Journalism.

Med Chi looks forward to Physician's Practice Digest becoming a reliable and up-to-date source of crucial practice management information for all physicians in Maryland. Submissions and suggestions are always welcome!

## Maryland Medical Journal Editorial Board

Mr. President and Members of the House of Delegates:

This report covers the calendar year 1990 (Volume 39). Throughout this period, the Editorial Board encouraged the submission of original research, case studies, review articles, medical history, and diagnostic and therapeutic updates, as well as commentaries and Letters to the Editor on all subjects of interest to Maryland physicians.

In all but three months there were special or thematic issues. The traditional legislative issue in January included Med Chi's Legislative Directory and four Faculty Position Papers. The May issue highlighted Reynaldo Lee-Llacer MD, the 1990-1991 Med Chi President, who took office May 11, 1990. The Faculty's annual reports appeared in the August issue.

Four issues were dedicated to clinical activities at local hospitals. Last featured in *MMJ* in September 1974, St. Agnes Hospital was the focus of the June issue. The articles and the Hospital's 128-year history reflect its continuing commitment to the health care needs of its community. In honor of the Centennial of The Johns Hopkins Hospital and School of Medicine, the April *MMJ* featured fifteen articles showing the present generation of physicians and scientists who are continuing the Hopkins tradition of excellence. In July, the growth and diversification of Baltimore County General Hospital during the past twenty-five years were highlighted in nine manuscripts. The Greater Baltimore Medical Center also celebrated its twenty-fifth anniversary in 1990, and the articles in the October issue outlined its services and advancements in technology and patient care.

The February issue, "AIDS: Living Long Living Well," presented thirteen articles and commentaries exploring both traditional and less established approaches to the treatment and prevention of AIDS. It has become one of the most requested issues of the journal.

Med Chi's Physician Rehabilitation Committee coordinated the production of the November issue, "Helping is our Business." The articles addressed physician addiction to pharmaceuticals, the effects of physician impairment on the family, and programs that identify and assist physicians experiencing problems.

There were twelve Editorial Board meetings during this period. A total of 145 manuscripts were reviewed, a twenty-seven percent increase over 1989. Ninety-five manuscripts were accepted, twenty-nine were not approved, two were withdrawn, and three were referred to the Faculty's new practice management publication, *Physician's Practice Digest*.

The remaining sixteen are manuscripts on which the Board requested revisions, but which have not yet been resubmitted. In addition, five Letters to the Editor were submitted, three of which were accepted.

The fourth annual Best Article Award was presented to Gerald A. Glowacki MD at Med Chi's Semiannual Meeting in September. Dr. Glowacki was chosen for his excellent treatise, "Estrogen Replacement Therapy: Risk/Benefit Ratio for Treatment," which appeared in the July 1989 issue.

The Editorial Board is most grateful to those specialists who graciously contributed their time and expertise in the reviewing of manuscripts. The following physicians assisted in *MMJ*'s review process during 1990: John G. Bartlett MD, Marian Damewood MD, Peter Hartman MD, Eugene Katz MD, Herman C. Maganzini MD, and Anthony Tommasello MD.

Total page count for Volume 39 was 1,136 (up 22 pages from the previous year). Distribution averaged 7,735 per month, up from 7,600 in 1989. Advertising space averaged 35 percent throughout the year, an increase from 33 percent in the previous year. Postage, paper and production costs continued to rise but income kept pace.

As always, those associated with the production of the *Maryland Medical Journal* appreciate the careful attention of individual department editors who monitor their columns for scientific accuracy and correct citations.

The Editorial Board encourages Med Chi members to communicate regularly and often about any and all facets of the publication.

## Maryland Medical Political Action Committee

Mr. President and Members of the House of Delegates:

**D**uring 1990, the Maryland Medical Political Action Committee (MMPAC) enjoyed a very high level of success and influence. Of the candidates supported by MMPAC, 96 percent won their races for the Maryland Legislature. The *Baltimore Sun* and the *Washington Post*

have reported MMPAC to be the most influential political action committee in the State.

Government is very much a part of the practice of medicine. Medical decisions are shaped by policy set by the legislators in Washington and Annapolis. We must work hard to influence those legislators, and we need all physicians as members.

Candidate support is central to MMPAC's existence, and political education is also very important. Both require substantial funding.

Please join today! The dues of \$100 will make you a member of both AMPAC (American Medical Political Action Committee) and MMPAC. Your future practice of medicine may depend on it.

I would like to thank all the members of the Committee for their time and effort. I would also like to add that it is with the greatest sorrow that the Committee mourns the passing of one of its members, Aris T. Allen MD. He is sorely missed.

## Maternal Welfare Subcommittee

Mr. President and Members of the House of Delegates:

The Maternal Welfare Subcommittee began its 1990-1991 year by increasing awareness of the problems associated with transmission of the hepatitis B virus. The Subcommittee printed information in the *Maryland Medical Journal* about the Department of Health and Mental Hygiene's (DHMH's) Hepatitis B Perinatal Prevention Program. The primary objective of this program is to prevent morbidity and mortality due to perinatal transmission of the virus. The Subcommittee also sent information about the program to nurse midwives in Maryland.

This year, the Subcommittee also addressed issues surrounding perinatal and maternal mortalities. The Subcommittee is presently pursuing activities related to the review of perinatal and maternal mortalities in the State. The purpose of these reviews is to target specific problems and address them in an educational format.

On the legislative front, the Subcommittee reviewed SB 162, an abortion bill passed by the Maryland Legislature. Committee members reviewed the parental notification aspects of the bill along with the language concerning viability of the fetus, abortion, and referral procedures. The Subcommittee chose not to provide written guidance to physicians practicing in this area since the members determined that the language in the statute was sufficiently clear and self-explanatory.

With regard to SB 615 (State Commission on Infant Mor-

tality), the Subcommittee reviewed the bill and supported the purpose of the Commission which is to reduce infant mortality in the State.

On the national level, the Subcommittee members familiarized themselves with the federal government's latest efforts at reducing infant mortality. The Health Resources Services Administration has targeted funds for reducing infant mortality. These funds will be distributed to ten cities that qualify for this new federal Healthy Start Program. Baltimore City qualifies for the program and Subcommittee members have recommended that Med Chi support the City's efforts to obtain this federal funding.

The Subcommittee is looking forward to another productive year aimed at improving the quality and delivery of health care with regard to maternal welfare issues.

## Liaison Committee with the Medical Assistance Program

Mr. President and Members of the House of Delegates:

During the 1990-1991 year, the Liaison Committee with the Medical Assistance Program focused on all of the issues surrounding implementation of the Maryland Access to Care (MAC) program. MAC is a program of managed care which is mandatory for certain Maryland Medicaid recipients. Under this program, a primary medical provider is responsible for coordinating all of the eligible recipient's health care.

One of the first items addressed by the Committee was the concern expressed by emergency room physicians that the MAC program would violate provisions of the Consolidated Omnibus Budget Reconciliation Act (COBRA) which contains a provision that patients can not be refused care simply because of their insurance status. The Committee was able to verify that the MAC program would not violate COBRA since, in fact, similar emergency room triage has been going on in other states for a number of years. Furthermore, the Department of Health and Mental Hygiene (DHMH) contacted a law professor specializing in COBRA issues and was

informed that the regulations of the MAC program would not violate any COBRA provisions.

Through the Committee's efforts, in conjunction with Med Chi's Executive Committee and Council, emergency room physicians' fees were increased. The increase is to be implemented concurrently with the increase in fees for primary care physicians under the MAC program.

In conjunction with DHMH, the Committee also provided continued support for and input into Med Chi's promotion of the MAC program. Mailings were sent to physicians alerting and informing them of the MAC program and encouraging them to sign up. MAC information and applications were made available at regional meetings. Information about the program was also disseminated in the *Maryland Medical Journal*. The Committee is proud to report that Med Chi's efforts at promoting this program, which will reduce medical costs and increase quality of care, resulted in over 1,400 physicians signing up to become primary care providers. Because of this participation, the MAC program was granted a waiver from the federal government.

Committee members provided input into the regulations drafted for the MAC program by providing staff participation at MAC Advisory Committee meetings held at DHMH.

At the present time, the Committee is continuing to work with DHMH to address physician concerns or inquiries about the MAC program. The program will officially begin on September 1, 1991. At that time, the increased fee schedule will go into effect and claims review will begin.

While much of the Committee's work was related to issues surrounding the MAC program, the Committee did review other Medicaid issues. In particular, Committee members addressed the following problems:

## ■ Computerized Medication Information Provided to Medicaid Patients But Not Provided to Treating Physicians

Conversations with DHMH revealed that this initiative was an educational effort to make the frail elderly more conscious of the need to inform their physicians of *all* of the medications they are taking. Confidentiality precluded DHMH from making this information available to the primary physician. Under the MAC program, this information can and will be provided to the primary physician.

## ■ Difficulty with the Provider 800 Information Line

DHMH immediately corrected 800 line problems as soon as it was made aware of them.

## ■ Updated Eligibility Requirements for Medical Assistance and Pharmacy Assistance

The updated eligibility information was printed in the *Maryland Medical Journal*.

## ■ Pharmacy Rebates

DHMH informed the Committee about pharmaceutical companies that had signed up for the rebate program under the Omnibus Budget Reconciliation Act of 1990 (OBRA 90). This information was sent to the component medical societies for dissemination to their membership.

## ■ Voucher Visits

Problems with voucher visits were presented to DHMH. DHMH is resolving this matter with the Department of Social Services.

## ■ Processing of Nursing Home Claims

DHMH is pursuing the issue of nursing home claims processing with Blue Cross/Blue Shield of Maryland. The matter was also referred to the Committee on Managed Care and Third Party Liaison for its input.

In the next year, the Committee will continue its efforts with the MAC program and will work with DHMH to assist physicians with issues concerning Medicaid.

## Subcommittee on Medical Radiation Technologist Regulations

*Mr. President and Members of the House of Delegates:*

**D**uring the 1990-1991 year, members were appointed to the Public Health Committee's Subcommittee on Medical Radiation Technologist Regulations. This Subcommittee was given the charge to evaluate the regulations concerning certification of medical radiation technologists and submit its recommendations to the Public Health Committee for presentation to the Executive Committee.

The Subcommittee was composed of a cross section of physicians whose practices included x-ray procedures. The twelve physicians appointed to the Committee specialized in Family Practice, Rheumatology, Internal Medicine, Pulmonary Diseases, Cardiovascular Diseases, Diagnostic Radiology, Nuclear Medicine, Gastroenterology, Otorhinolaryngology, Allergy, and Orthopedic Surgery. The Subcommittee thoroughly reviewed and evaluated the regulations concerning Certification of Medical Radiation Technologists and Nuclear Medical Technologists (COMAR 10.32.10), along with comments submitted by Med Chi physicians.

In considering the impact of the regulations on patient care, the Subcommittee addressed the following issues: exposure risk to patients and operators of x-ray equipment; the complexity of x-ray procedures; the availability of training programs and certified technologists; State inspection procedures; State requirements concerning x-ray equipment, shielding, exposure and film development; expediency of test results; and the lack of documentation at the State level about patient problems with office x-rays.

As a result of the Subcommittee's deliberations, it recommended that temporary certification be extended to those individuals who qualified and that a category entitled "x-ray assistant" be incorporated into the regulations. Under this category, an x-ray assistant would be an individual who is under the direct supervision of an office physician and who assists the physician in the performance of x-ray examinations that would *not* include fluoroscopy, invasive radiology, nuclear medicine, computerized and non-computerized tomography, radiation therapy, mammography, or xerography.

The Subcommittee's recommendations were forwarded to the Public Health Committee which strongly endorsed the recommendations and presented them to the Executive Committee. The Executive Committee approved of the recommendations and forwarded them to Israel H. Weiner MD, Chairperson, Board of Physician Quality Assurance (BPQA), for consideration as amendments to COMAR 10.32.10. Furthermore, a survey of 850 physicians with x-ray equipment in their offices was conducted to determine how these physicians viewed the impact of the current regulations on the quality of patient care and accessibility to care. Preliminary results revealed that the majority of physicians indicate that the current regulations would produce: a negative impact on their ability to diagnose and effectively treat patients; a negative effect on expediency of test results; and a negative effect with regard to the quality of care. These results were reported to all of the members of the BPQA on March 27, 1991 during a formal presentation of Med Chi's recommendations by J. David Nagel MD, Med Chi's President-elect; Herman C. Maganzini MD, Chairperson of the Public Health Committee; and Michael A. Sauri MD, Chairperson of the Subcommittee.

Legislative efforts in this area included amending HB 408 to incorporate the recommendations suggested and approved by Med Chi and presented to the BPQA. Under HB 408, the BPQA is directed to study and develop a proposal for an x-ray assistant classification in consultation with Med Chi and the Maryland Radiology Society. Toward this goal, the Subcommittee remains active.

The Subcommittee extends its appreciation to the Public Health Committee and the Executive Committee for their support and guidance over the past year.

## Committee on Mental Health

*Mr. President and Members of the House of Delegates:*

It is with deep regret that the Committee on Mental Health reports the passing of its Chairperson, Kenneth L. Malinow MD, on April 6, 1991. Dr. Malinow's wisdom and guidance will be sorely missed.

The Committee held four meetings during the past year. There were two major activities. The first was the submission of articles to the *Maryland Medical Journal* for publication consideration. A goal of the Committee has been to improve communication and collaboration between psychiatrists and other physicians in Maryland via the column, "Today's Psychiatry," in the *Maryland Medical Journal*.

The second activity was the cosponsorship of the presentation, "Current Treatment of Anxiety and Insomnia - Clinical and Epidemiological Aspects," with the Maryland Psychiatric Society at Med Chi's 193rd Annual Meeting. The presentation was well-received.

The Committee looks forward to a productive 1991-1992 year.

## Music Medicine Clearinghouse Committee

*Mr. President and Members of the House of Delegates:*

During 1990-91, the Music Medicine Clearinghouse Committee, which held three meetings, continued to move forward.

This past year, the Committee changed status from an ad hoc to a standing committee. Staff prepared a packet for the Executive Committee containing the new committee charge, an outline of the history of music medicine, a list of Clearinghouse users, a list of performing arts medicine clinics, the Clearinghouse bibliographies, and other information. The Committee's recommendation to the Executive Committee

was passed by the House of Delegates at the Semiannual Meeting in September.

In January, the Committee recommended that its name be changed to the Committee on Medicine and the Performing Arts, broadening its charge beyond the oversight of the Clearinghouse. The House of Delegates approved these editorial changes at the Annual Meeting in May.

In June, the Clearinghouse Coordinator contributed a paper at the Special Libraries Association (SLA) annual conference in Pittsburgh. The presentation, "The Music Medicine Clearinghouse--An Interdisciplinary Resource," provided a history of the Clearinghouse's development, described its services, and outlined its plans for the future.

In July, the Committee Chairperson wrote a letter to each state medical society and selected specialty societies, asking whether they had a committee concerned with music or arts medicine. Of approximately twenty specialty societies, only the American College of Occupational Medicine indicated it had a section or committee devoted to arts medicine. Neither the American Medical Association nor any other state medical society had such a committee.

Ties with the Peabody Conservatory's Office of Career Planning were maintained and talks with a newly appointed faculty committee from Towson State University's Music Department were begun. Staff from the music medicine clinics being developed at Children's Hospital and Sinai Hospital expressed interest in working with the Clearinghouse on future activities. During late summer, the Committee began liaison activities with other local organizations interested in arts medicine.

Clearinghouse staff examined several grant possibilities. The SLA's Awards Committee indicated an interest in Clearinghouse activities. Staff are also considering a grant application to the National Library of Medicine. A potential joint project between Med Chi and the International Arts-Medicine Association, funded by the National Endowment for the Arts, was explored.

In October, Clearinghouse staff were moved to a different part of the building and are now closer to the collection. Committee members assisted with refiling and reorganization. The acquisition of a second computer for Library Technical Services resulted in more computer time for Clearinghouse tasks. During this same period, Committee Member Jeffrey Palmer MD converted a portion of the bibliographies to a dBase program.

In March, the Clearinghouse celebrated *Music In Our Schools Month* with posters throughout the building, several informal flute recitals, and displays in the Krause Room. On March 7, a brown bag open house was held in conjunction with the viewing of the *World's Largest Concert* which was

sponsored by the Music Educators National Conference. A small group of physicians and musicians discussed the current state of music medicine locally, as well as prospects for the future.

For the third straight year, the Clearinghouse participated in the Faculty's Annual Meeting. The session was entitled "Upper Extremity Problems in Student Musicians: Diagnosis, Treatment and Prevention." Ralph Manchester MD of Rochester, NY discussed the prevalence and incidence of various problems and the prescribed treatments. Virginia Moratz OTR of Baltimore focused on physical and occupational therapies and instrument adaptations.

The year ended with many plans for the future. The Clearinghouse Coordinator submitted an abstract to be considered for the next *Symposium on Medical Problems of Musicians and Dancers* in Aspen. Staff began work on the SLA's Special Projects grant application. Communication from Hunter Fry MD (a recognized authority on overuse injuries) regarding his visit to the Baltimore/Washington area next January prompted renewed interest in a mini-symposium. The Peabody Conservatory, Towson State University, Sinai Hospital, and Children's Hospital have offered to assist Med Chi with planning such a meeting.

## Nominating Committee

*Mr. President and Members of the House of Delegates:*

**T**he Nominating Committee recommended the following slate of candidates for presentation to the House of Delegates on Wednesday, May 8, 1991. (Those elected will assume office for one year at the conclusion of the 1992 Annual Meeting unless otherwise indicated.)

### ■ President-Elect *1991-1992*

Jose M. Yosunico MD  
Baltimore, *Baltimore City*

### ■ First Vice President

Gary L. Rosenberg MD  
Baltimore, *Baltimore City*

### ■ Second Vice President

Benjamin Maldonado MD  
Upper Marlboro, *Prince George's County*

### ■ Third Vice President

Alex Azar MD  
Salisbury, *Wicomico County*

### ■ Secretary

Albert L. Blumberg MD  
Baltimore, *Baltimore County*

### ■ Treasurer

Lawrence H. Fink MD  
Laurel, *Montgomery County*

### ■ Committee on Scientific Activity *(6-year Term)*

Esther Edery, MD  
Towson, *Baltimore County*

### ■ Finney Fund Committee *(5-year Term)*

Daniel C. Finney MD  
Baltimore, *Baltimore City*

### ■ Delegates to the AMA

*January 1, 1992 - December 31, 1994*

J. David Nagel MD  
Lutherville, *Baltimore County*

*January 1, 1992 - December 31, 1994*

Marvin Schneider MD  
Wheaton, *Montgomery County*

*January 1, 1992 - December 31, 1994*

Lawrence H. Fink MD  
Laurel, *Montgomery County*

### ■ Alternate Delegates to the AMA

*January 1, 1992 - December 31, 1994*

Raymond M. Atkins MD  
Baltimore, *Baltimore City*

*January 1, 1992 - December 31, 1994*

Alex Azar MD  
Salisbury, *Wicomico County*

*January 1, 1992 - December 31, 1994*

### Occupational Health Committee

*Mr. President and Members of the House of Delegates:*

**T**he Occupational Health Committee met four times during the 1990-1991 year to discuss items related to occupational medicine.

The Committee continued its efforts to obtain data from Worker's Compensation Insurance Carriers on the treatment of lower back pain. Seven insurance companies were surveyed. The data were reviewed for possible guidelines for length of treatment for lower back pain.

Efforts were also made to change the regulations in the State code regarding Worker's Compensation. The areas of concern were: (1) approval of treatment in a defined time frame for disputed treatment and (2) payment from insurance carriers to providers in a defined time frame.

The Committee invited the Chairperson of the Medical Fee Guide Advisory Committee to report on the history, continued interest, and progress of the revision of the *Medical Fee Guide*.

The Committee sponsored a scientific session at the 1991 Annual Meeting of Med Chi. The session, "Shift Worker Injuries and Sleep Physiology," was designated as the George M. Boyer MD and McKendree Boyer MD Memorial Lecture. Those attending showed much interest.

The Committee looks forward to the coming year and will strive to provide appropriate education to physicians and the public. The Chairperson appreciates the dedication of the Committee members and Med Chi staff.

### Peer Review Committee

*Mr. President and Members of the House of Delegates:*

**T**he Peer Review Committee met ten times during the past year to carry on its work of evaluating physician practice patterns for the Maryland Board of Physician Quality Assurance (BPQA).

In addition to record reviews, personal interviews, and on-site visits to physicians' offices, Committee members attended monthly meetings to participate in the discussion and resolution of cases. Often the work of the members does not end with the conclusion of the Committee's investigation, since additional record reviews and meetings with members of the Attorney General's staff to prepare cases for legal action also may be required.

Due to the large volume of cases referred for investigation over the past two years, a significant backlog existed at the beginning of this year which has now been completely eliminated. To achieve this, sixty-two medical record reviews, twenty-five office visits, and eight interviews were

conducted resulting in seventy-six completed reports submitted to the BPQA.

In addition to eliminating the backlog, the Committee chose to concentrate on quality assurance by upgrading written reports and conducting comprehensive, focused reviews in a timely manner.

The Committee regularly employs nonmember physicians as specialty consultants and, recently, the Attorney General's office requested that at least three specialists participate in each review. Therefore, the Committee needs additional reviewers and welcomes any volunteers who wish to assist in this important work.

My sincere thanks to the dedicated members of this Committee, to our many specialty consultants, and to the Med Chi staff for their support and assistance during this past, very busy year.

## Peer Review Management Committee

*Mr. President and Members of the House of Delegates:*

**T**he Peer Review Management Committee (PRMC), in existence since June 1989, has continued its function of overseeing the peer review process, as specified in the *Peer Review Handbook for Maryland*. The Committee meets monthly and is responsible for the following duties:

- Receive and record cases referred to Med Chi by the Board of Physician Quality Assurance (BPQA).
- Identify the guidelines used in conducting the review.
- Refer cases to the appropriate medical review committee.

- Develop and maintain a monitoring procedure allowing for the immediate determination of the status of a peer review complaint and ensuring that the review is completed in a timely manner.
- Review reports received from investigating committees to determine their adequacy.
- In the event the Committee finds a report inadequate, to specifically identify the inadequacies in writing and return the report to the review committee.
- Transmit adequate reports to the BPQA.
- Forward a copy of final disposition reports received from the BPQA to the appropriate medical review committee.
- Identify areas in which medical review committees need education and arrange to have the necessary education provided.
- Provide organizational assistance to any medical review committee in Maryland.
- Periodically meet with the BPQA to decide what kinds of statistical information are needed by the BPQA, Faculty, and component societies to aid in evaluating and upgrading the review process.

Med Chi has distributed the recently developed *Peer Review Handbook for Maryland* to all components and existing peer review committees.

During 1990-1991, the BPQA worked diligently to eliminate its backlog and so did Med Chi. Med Chi review committees completed a combined total of 335 cases.

Because of the importance of investigations by physicians of the same specialty, PRMC made a special effort to involve more specialty societies in the peer review process. Several societies have expressed an interest in participating in the investigative process and in acting as consultants to standing peer review committees.

As a subcommittee of the Peer Review Management Committee, the Committee for Focused Professional Education continued its work under the Chairpersonship of Ronald J. Cohen MD. A plan for a professional educational program prototype was developed. The subcommittee is now a standing committee and the program is functioning. The program adds an option that was not formerly available to the BPQA. Until now, the BPQA was restricted either to punitive action against the physician, or to no action at all. In the course of peer review, aspects of medical practices may be identified that might be substandard, but which are of an overall quality that it would be inappropriate to take action against the physician's license. Although peer review committees often

make recommendations for changes in a physician's practice, subsequent reviews might reveal that insufficient change has occurred. The focused professional education program gives a physician who is weak in a specific area the opportunity to improve his/her practice habits.

The Chairperson thanks all the members of the Committee and the Med Chi staff for their efforts and support which ultimately enabled the PRMC to make a significant contribution to the efficacy and fairness of the review process.

## Ad Hoc Committee on Physician Licensure Regulations

*Mr. President and Members of the House of Delegates:*

On March 12, 1991, the Maryland Board of Physician Quality Assurance (BPQA) asked Med Chi to solicit physician reaction to proposed changes in physician licensure regulations. In response, Med Chi formed an Ad Hoc Committee on Physician Licensure Regulations to review and make recommendations regarding the proposed regulations as they pertain to the licensure and license renewal of all Maryland physicians. The Committee was charged to make recommendations that will continue to ensure quality patient care without placing undue restrictions on physician licensure.

The Committee met twice in April and agreed that several proposed provisions were excessively intrusive. It was the consensus of the Committee that the BPQA is seeking information from applicants applying for license renewal that goes beyond what is reasonable or appropriate. The Committee indicated ways in which to limit the scope of these provisions. It also suggested that the application process conform more closely to the hospital credentialing process developed by Healthcare Credentials Verification, Inc.

Preliminary comments were submitted to the Chairperson of the BPQA and the Chairperson of BPQA's Physician Licensure Committee.

## Physician/Patient Relations Committee

*Mr. President and Members of the House of Delegates:*

The Physician/Patient Relations Committee continues to investigate individual complaints against physicians involving standards of medical care, including health claims arbitration cases and fee disputes. These complaints are investigated at the request of the Board of Physician Quality Assurance (BPQA), and the Committee submits its findings and recommendations to the BPQA for consideration and disposition at the completion of each investigation. During the past year, sixty-one completed reports were submitted to the BPQA.

In addition to conducting investigations, Committee members and staff respond to daily inquiries on the practice of medicine and related issues. This activity is an important part of the Committee's goal to improve communications and enhance relations between physicians and their patients.

The dedication and commitment of Committee members and staff to the continuation and improvement of the peer review process is deeply appreciated.

## Committee on Physician Rehabilitation

*Mr. President and Members of the House of Delegates:*

**T**he 1990-91 period was a productive, evolutionary year for the Committee on Physician Rehabilitation.

In concert with the Committees on Drugs and on Alcoholism and Chemical Dependency, the Committee sponsored a highly successful two-day conference, "Practical Clinical Management: Drug Abuse Education for the Primary Care Physician," on October 20 and 21, 1990. An excellent monograph of this program is available through Med Chi's Physician Rehabilitation Program Public Relations Coordinator.

The Committee expanded the Physician Rehabilitation Program by hiring additional staff. This allows more outreach to the Maryland medical community. Presentations are being made to hospital medical staffs throughout the State. Future outreach efforts will include component and specialty societies. Overall, the presentations have been fairly well-received though some resistance continues to be encountered on this sensitive issue.

The measure of effectiveness of the outreach efforts lies in the number of "concern calls" received. A concern call or referral to the Program initiates the investigation process. In the first quarter of 1991, there was a 31 percent increase in referrals over the last quarter of 1990 and a 50 percent increase over the first quarter of last year. Even if the referral rate levels off at its current rate, there will still be a 20 percent increase across the year.

There will also be a favorable impact on the quality of medical care for more patients as a direct result of the increasing number of physicians the Physician Rehabilitation Program is able to get into treatment.

The significant expansion in referrals can also be attributed to public relations efforts. The charter edition of the newspaper, *Straight Forward*, that informs and educates physicians and other allied health professionals on issues of substance abuse, was published in 1990. Also, the November 1990 issue of the *Maryland Medical Journal* was coordinated by the Physician Rehabilitation Committee.

Advertisements in the *MMJ*, the distribution of almost 100,000 copies of *Straight Forward*, and the excellent reviews of the drug conference held last October, have all been positive mechanisms to enhance awareness of the Program.

The Committee's latest endeavor is the rehabilitation of

Maryland physicians through the Focused Professional Education Program. It is aimed at assisting physicians who are in need of educational rehabilitation in order to keep, obtain, or re-attain their medical license.

The final offering for the 1990-91 year was the panel discussion, "To Test or Not to Test," at the Annual Meeting in College Park. The session was well-attended. The topic of whether or not to drug-test physicians resulted in a lively discussion.

The Physician Rehabilitation Committee is pleased with the changes made in the past year and looks forward with anticipation to continued growth during the next year.

## Policy and Planning Committee

*Mr. President and Members of the House of Delegates:*

**D**uring the 1990-1991 operational year, the Policy and Planning Committee held one Committee meeting and one subcommittee meeting.

On March 21, 1991, the full Committee met for the purpose of developing a future agenda involving the governance and administration of the Faculty. Subjects discussed were:

- *Communication* within Med Chi and external to the Faculty.
- *Lines of authority*, particularly those of the President and Chairperson of Council.
- *Length of office terms* as one year may be insufficient.
- *Revitalization of the House of Delegates* as the House appears to be ceremonial only.
- *State regionalization* which may increase the interest of the smaller counties and provide stronger representation from rural areas.

- *Committee activity.* Increase committee involvement and control committee actions through the Executive Committee by having each Executive Committee member review the activity of specific committees.
- *Vice Presidential structure* as the current structure appears to be of little value.
- *Election of certain officers.* For example, elect the Secretary and Treasurer for the current term and not for a year in the future.
- *Establishment of a Council Steering Committee* to represent the interests of the smaller components.
- *Election or appointment of a House of Delegates and/or Council* which would provide an opportunity to develop leadership.
- *Establishment of an off-site Executive Director's position* for the smaller components.
- *Use of the American Medical Association's (AMA's) governance structure as a model* for Med Chi.
- *Compartmentalization* of the House of Delegates.

The Committee moved to address each issue separately by placing each issue on an agenda for review and comment at its next meeting. To carry out this objective, the Chairperson appointed a subcommittee which included Drs. Dobridge, Blumberg, Breschi, Fastow, and Rosenberg.

The subcommittee met on April 25 to review the many issues discussed earlier. It decided to ask each individual subcommittee member to put in writing his own recommendations for organizational and governance changes. The subcommittee is scheduled to reconvene on June 12, 1991 to consider each recommendation and formulate subcommittee recommendations for a full Committee meeting to be scheduled at a later date.

## Committee on Professional Ethics

*Mr. President and Members of the House of Delegates:*

**T**he members of the Committee on Professional Ethics have been active in a variety of ways this past year in helping to educate the medical community about the ethical responsibilities pertaining to physicians, other health care practitioners, and the public.

The Committee has revised or developed ethical opinions related to the responsibility of physicians to patients in regard to contractual agreements, euthanasia, agreements restricting the practice of medicine, gifts to physicians from industry, and the use of trade names by physicians.

The Committee completed an update of the *Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland*, effective August 1990. The *Compendium* is presented in a format allowing for supplemental updates.

An educational program was sponsored by the Committee at the Faculty's Annual Meeting in May on "Durable Powers of Attorney and Living Wills." The purpose of the panel was to discuss the use of these tools in assuring patient control over medical decisions in the event of disability.

Committee on Professional Ethics Chairperson Louis C. Breschi MD (right) receives a Certificate of Appreciation from President Reynaldo L. Lee-Llacer MD.

The Chairperson would like to express his thanks to the members of this Committee who have devoted countless hours to the important work of this Committee.

## Professional Review Organization Monitoring Committee

Mr. President and Members of the House of Delegates:

At the beginning of the 1990-1991 year, the Professional Review Organization (PRO) Monitoring Committee vigorously addressed the pilot project for office-based reviews (DEMPAQ) proposed by the Delmarva Foundation for Medical Care, Inc. (DFMC). (DFMC is the Medicare peer review organization for Maryland and Washington DC.) DEMPAQ is a three-year demonstration project funded by the Health Care Financing Administration (HCFA) to develop tools to review the care given to Medicare beneficiaries in physicians' offices. The DFMC's proposal was in response to a Congressional mandate to HCFA to develop a system to review office-based care.

The Committee began its review of the project by inviting the DFMC to make a presentation at the Faculty building. Further efforts in this area concerned obtaining and reviewing the technical information of the project, reviewing the American Medical Association's (AMA's) evaluation of the project, attending joint meetings of the Maryland Society of Internal Medicine with DFMC representatives and the chief investigator for the project, and engaging in ongoing dialogue with Maryland physicians, project investigators, and DFMC representatives. The Committee continuously updated the Executive Committee and Council on the project.

Since family practitioners, internists, and general practitioners were being asked to participate in this pilot project, the Committee asked the DFMC to verify that participation was strictly voluntary. Furthermore, the Committee made the DFMC aware of its concerns over the long-range implications and far-reaching consequences of office-based reviews. Confidentiality of patient records was discussed with the DFMC. The Committee strongly supported continuing medical education (CME) credits for physicians who volunteered to participate in the pilot project.

As a result of the Committee's efforts in this area, Med Chi's President, Reynaldo Lee-Llacer MD, appointed the Committee's Chairperson as Med Chi's physician consultant to the DEMPAQ project. As physician consultant, the Chairperson will be providing input into the design of the review and critiquing various aspects of the project.

Information about the DEMPAQ project was sent to all component and specialty societies. Furthermore, the Committee has prepared an article on the DEMPAQ project for publication in the *Maryland Medical Journal*.

Another area of concern to Committee members was the issue of representation on the Board of Directors of the Delmarva Foundation for Medical Care, Inc. Although the DFMC conducts PRO reviews of all participating physicians in Maryland, its Board only includes representation from the Eastern Shore and the District of Columbia. Therefore, the Committee recommended, and Council approved, that DFMC give consideration to a geographically-balanced membership on its Board. The Committee pursued this issue and on April 19, 1991, the DFMC's Board agreed to offer a voting seat to a non-Eastern Shore physician in Maryland. The Board also agreed that geographic representation should occur for Maryland by rotating nominations every year or two to represent the four remaining geographical areas of western, central, southern, and northern Maryland.

As part of its educational and informational responsibilities, the Committee disseminated information about the

DFMC's sanction process to component and specialty societies. An article on how to respond to a PRO quality inquiry was also published in the *Maryland Medical Journal*. In addition, individual physicians were provided with this information so they could understand the sanction process under the Third Scope of Work.

During the past year, the Committee has reviewed sanitized patient medical records sent by physicians expressing concern about the actions taken by the DFMC. Committee members thoroughly reviewed and evaluated the cases and notified the concerned physicians of their recommendations. The Committee, with Executive Committee and Council approval, also corresponded directly with the DFMC concerning specific cases.

Because of the Committee's efforts on behalf of Maryland physicians, the Committee's bylaws were changed to more accurately reflect the Committee's activities. The new bylaws allow the PRO Monitoring Committee to respond in a timely manner to inappropriate actions taken by the DFMC against physicians.

In April, the DFMC presented a preview of HCFA's Fourth Scope of Work contract. The Fourth Scope of Work is set to be implemented in Maryland on April 1, 1992. The Committee is actively monitoring issues related to the Fourth Scope of Work and will be keeping Med Chi informed of the specific activities related to this next phase of PRO review.

The PRO Monitoring Committee has begun a project by which parameters will be established to act as a model for the review of medical charts by review agencies. Many of the problem cases reviewed by the Committee were not related to errors in judgment but rather to the methodology of the reviewing agents.

The PRO Monitoring Committee is looking forward to another productive year addressing the concerns of Maryland physicians as they relate to peer review activities.

The Committee also looks forward to a good working relationship with the DFMC under the leadership of Christian E. Jensen MD, MPH, Corporate Medical Director.

The PRO Monitoring Committee would like to express its appreciation to the Executive Committee and Council for their support during this past year. The Committee also appreciates the assistance of the Maryland Society of Internal Medicine with regard to the DEMPAQ project.

## Committee on Public Health

Mr. President and Members of the House of Delegates:

During the 1990-1991 year, the Committee on Public Health tackled a variety of public health issues.

### ■ Tobacco Legislation

The Committee began its session by reviewing the implications of various bills related to cigarettes and tobacco. The Committee's deliberations resulted in the support of these bills with certain modifications assuring that revenues generated from increased taxes be placed in health care programs addressing medical problems related to tobacco use. As a result of the Committee's recommendations, Med Chi's Council supported the anti-tobacco legislation with the proposed modifications. Furthermore, Committee members attended a Med Chi rally in Annapolis to demonstrate their support and offer testimony for this legislation. At the suggestion of a Committee member, cards were handed out to Maryland legislators listing the House and Senate bills that Med Chi supported with regard to anti-tobacco legislation. These cards asked the legislators to join with Med Chi's physicians and vote for legislation that would benefit the health of the citizens of Maryland.

Because of the support for the anti-tobacco legislation, the Committee also addressed the issue of making the Faculty building smoke-free for all meetings and events. The Committee recommended that Med Chi adopt a *no smoking* policy for all of the Faculty's buildings.

### ■ Technologist Certification

The Committee was also charged with the responsibility of reviewing the Maryland regulations concerning certification of medical radiation technologists and nuclear medical technologists. The Committee recommended, and Council approved, that a subcommittee be appointed to evaluate the regulations and submit a report to the Committee for its consideration and for later presentation to Med Chi's Executive Committee. Therefore, a subcommittee was appointed with Michael A. Sauri MD as Chairperson. This subcommittee thoroughly reviewed and evaluated the regulations and considered the input provided by Med Chi physicians. The Committee also conducted a survey of physicians' offices containing x-ray equipment to determine how those physicians perceived the regulations would impact on their practices. After deliberation in subcommittee and at the Public Health Committee level, the subcommittee recommended that Med Chi propose the creation of an "x-ray assistant" category for staff who perform simple routine procedures in physicians' offices, and that the certification period be extended for office personnel who qualified for temporary certification. The Faculty adopted this position and Herman C. Maganzini MD, Chairperson of the Public Health Committee, Michael A. Sauri MD, Chairperson of the subcommittee, and J. David Nagel MD, Med Chi President-elect made a presentation before the Board of Physician Quality Assurance. Further efforts in this area involved amending a mammography bill to reflect the creation of an x-ray assistant category and to allow for extension of temporary certification for individuals employed in this capacity as of August 1, 1988.

### ■ Laboratory Regulations

The Committee on Public Health also received the charge to review Maryland's laboratory regulations. Although the Clinical Laboratory Improvement Act of 1988 (CLIA-88) regulations had been withdrawn by the federal government, Maryland's laboratory regulations were not withdrawn. Numerous physician complaints and concerns about Maryland's laboratory regulations prompted Med Chi to address this issue in a definitive manner. Specifically, a subcommittee of the Public Health Committee was appointed and chaired by Carol W. Garvey MD. The subcommittee thoroughly reviewed and evaluated the laboratory regulations with input provided by Maryland physicians. Careful deliberation of access issues, quality of care concerns, and cost effectiveness led the subcommittee to recommend regulatory changes. These recommendations were wholeheartedly endorsed by the Public Health Committee and forwarded to the Executive Committee for approval. The recommendations were approved and sent to Jack

DeBoy DrPH, Assistant Director, Laboratories Administration, Department of Health and Mental Hygiene (DHMH), for his department's consideration. Furthermore, Med Chi's Council demanded that full implementation of the laboratory regulations be withheld until a more reasonable and fair method of inspection and certification could be devised. Med Chi, with the assistance of Committee and subcommittee members, is continuing a dialogue with the Laboratories Administration on this matter.

### ■ Health Insurance Reform

Another very important issue facing the Committee was health insurance reform. The Chairperson, Herman C. Maganzini MD, is the State Coordinator for the American Medical Association's (AMA's) Health Access America program which offers proposals for extending access to affordable health care, controlling inappropriate health care cost increases, and sustaining the Medicare program. After reviewing the AMA's program, the Committee recommended and the Council approved, supporting the Health Access America program. The Chairperson has described the Health Access America program at various functions throughout the State.

In conjunction with reviewing the Health Access America program, the Committee also reviewed the joint interim recommendations of the Governor's Commission on Health Care Policy and Financing and the Committee on Uninsured Persons and Uncompensated Care. The Committee on Public Health noted that many of the recommendations were similar to those made in the Health Access America program. The Committee is in the process of reviewing and evaluating all of the recommendations. The Committee also discussed the implications of HB 1120 which passed the Maryland legislature and provided a minimum benefits package to employers with at least two but not more than twenty-five employees. The Committee will continue to pursue these issues and make appropriate recommendations.

### ■ Immunizations

In the area of immunizations and infectious diseases, the Committee addressed the recent outbreak of measles in the Philadelphia area and the possibility of an outbreak of measles in our State. In its effort to assist Maryland physicians, the Committee recommended, and Council approved, that Med Chi join forces with DHMH and the Maryland Chapter of the American Academy of Pediatrics to publicize the fact that persons born after 1957 should be immunized with a second dose of the measles-mumps-rubella (MMR) vaccine. Activities continue in this area.

The four subcommittees of the Committee on Public Health (Immunizations and Infectious Diseases Subcommit-

tee; Infant, Child and Adolescent Health Subcommittee; Maternal Welfare Subcommittee; and Sports Medicine Subcommittee) provided valuable input on pertinent subjects. All of the subcommittees will continue to actively pursue issues and make recommendations to the Executive Committee and Council.

The Committee on Public Health appreciates the efforts expended by Committee, subcommittee, and special subcommittee members. The Committee would also like to thank the Executive Committee and Council for their support and guidance throughout the year.

## Public Relations Committee

*Mr. President and Members of the House of Delegates:*

**I**n an effort to encourage physician involvement and enhance the physician's image within local communities, the Public Relations Committee began a new public relations effort called the Doctor/Lawyer/Teacher Partnership Against Drugs in May 1990. Through this joint program with the Maryland Bar Association (MBA), doctor/lawyer education teams visited area schools to talk with students about the medical and legal dangers of drug and alcohol use in an attempt to discourage them from using drugs.

Med Chi and the MBA initiated a pilot program last May, based on a model established by the American Medical Association (AMA) and the American Bar Association (ABA), at the Nicholas Orem Middle School in Hyattsville, Maryland. Valerie Siegal Esq., an Assistant State's Attorney, and Kevin Hennessey MD, a neurologist, met with two classes of students from the seventh and eighth grades. The initial program was well-received by students, teachers, and administrators from Prince George's County.

*Don DeVito MD talks with seventh graders about the medical hazards of drug abuse as a physician volunteer in the Doctor/Lawyer/Teacher Partnership Against Drugs.*

Med Chi and the MBA gained approval for the doctor/lawyer team visits by Maryland State Board of Education officials in August 1990 and announced the initiation of the program at a press conference on September 25, 1990. Governor William Donald Schaefer attended the conference to show his support for the program and remarked that the Partnership represents an outstanding example of volunteerism in the local community.

### ■ Partnership Program Recruitment and Training

In September 1990, the Public Relations Committee invited all component societies to participate in the program and asked each component society president to appoint a county coordinator. In October, all county coordinators were invited to attend a joint meeting with their MBA counterparts in Hagerstown, Maryland. During this meeting, physician leaders for the program met with their lawyer counterparts and discussed possibilities for the program in their communities.

The Committee began actively recruiting physician volunteers for the program from October through December 1990. In January 1991, all doctor and lawyer volunteers in Baltimore City were invited to attend one of four training sessions held on January 9, 16, 28 and February 25 at Med Chi. During the sessions, Andrea Bowden of the Baltimore City school system's Office of Science and Health identified several strategies for talking to children about drugs. Jamey Hochberg Esq. and Valerie Siegal Esq. spoke about their experiences in talking with students.

Following each session, Med Chi's Statewide Program Coordinator, Hiroshi Nakazawa MD, met with physicians to review

talking points and information from the National Institute on Drug Abuse. The program in Baltimore City spanned from February 21 to April 19, 1991. During that period, more than fifty doctor/lawyer teams visited a total of 4,600 students in 153 classes at thirty-eight schools.

Prince George's County also initiated training sessions for doctors and lawyers. Physicians and lawyers met with over 1,500 students during their visits to over fifty-four classes in twenty-one schools across the county.

Currently, more than 250 physicians statewide have volunteered to participate in the Doctor/Lawyer/Teacher Partnership Against Drugs. The Eastern Shore, and Kent, Worcester, and Caroline Counties reported that doctor/lawyer teams have visited schools in their communities. In western Maryland, Frederick County physicians have visited several schools. The Public Relations Committee plans to initiate training sessions in Carroll County in the future. In southern Maryland, over sixteen doctor/lawyer teams entered several schools in Anne Arundel County. Harford County doctors and lawyers sent teams to more than twenty classes in the county and spoke with over 600 students. In Baltimore County, physicians have met with school representatives and intend to launch a pilot program in Dundalk, Dulaney Valley, and Towson area high schools. The program has been very well-received by physicians, lawyers, teachers, and students in most every county.

### ■ Partnership Program Promotion and Media Coverage

To help create a lasting impression of the visit, Med Chi's Physician Rehabilitation Program produced picture frame magnets and posters with the slogan, "You're Good. Too Good for Drugs." These are distributed by the doctor/lawyer teams during their schools visits. Physicians can request these magnets to give to students and can order posters to be placed in schools and in their offices. Both the magnets and posters are aimed at reminding people, especially the young, that they do not need to start taking drugs and that support systems are available to help them avoid making the wrong decisions.

Media coverage of the program has been outstanding. Stories regarding the program have appeared in several newspapers around the state including the *Baltimore Sun*, the *Washington Post*, *Prince George's Sentinel*, and the *Frederick Post*. Channel 13 (WJZ-TV) aired the press conference with Governor Schaefer on September 25, and both Channel 13 and Channel 2 (WMAR-TV) aired stories about a doctor/lawyer visit to a Baltimore City school on April 9. During the week of May 18-24, Channel 24 (WHSW-TV) aired a five-minute segment on a doc-

tor/lawyer visit as part of "In Your Interests," a program that airs each hour. Dr. Nakazawa has appeared on two area talk shows to promote the program including WCVT-FM at Towson State University and "Consultation, with John Stupak" on WBAL-AM radio.

In addition to media coverage, the program was honored with a special award from the AMA "in recognition and appreciation for the outstanding work done by its physician members in the Maryland Doctor/Lawyer/Teacher Partnership Against Drugs Program." Med Chi presented Dr. Nakazawa with a special certificate in recognition of his outstanding efforts as Statewide Coordinator for the program.

The Public Relations Committee sponsored a session during the Med Chi Annual Meeting on the Partnership program. During the session, Hiroshi Nakazawa MD, Kevin Hennessey MD, Gary Pushkin MD, and Ms. Andrea Bowden shared their experiences about the program and encouraged other physicians to become involved.

### ■ Radio Programs

In addition to the Doctor/Lawyer/Teacher Partnership Against Drugs, the Committee continued producing two radio programs for Med Chi physicians. "Consultation, with John Stupak" is Med Chi's live call-in show heard on over fifty radio stations across the country including WNAV-AM in Annapolis on Sunday from 2:00-3:00 pm. John Stupak also hosts Med Chi's Sunday Morning "Consultation," a physician interview show on WBAL-AM radio airing at 7:00 am. Subjects discussed on the national program include topics such as acquired immunodeficiency syndrome (AIDS), nutrition, cancer, sports medicine, and headaches.

In an effort to encourage speakers to participate in the radio programs and persuade physicians to speak to public groups, the Committee ran monthly advertisements for "Consultation" and for Med Chi's Speaker's Bureau in the *MMJ*. Over fifty-five physicians currently participate as speakers on the radio programs and for the Speaker's Bureau which helps Med Chi respond to requests from the public for information on a specialty or topic.

### ■ Awards

The Committee continued to sponsor its awards programs including the Wyeth-Ayerst Laboratories Physician Award for Community Service. Formerly the A.H. Robins Award, the award is presented each year to a physician who has provided outstanding service to his or her community outside the field of medicine. Donald T. Lewers MD received the

1991 award during the Med Chi Annual Meeting for his outstanding efforts to help conserve Maryland's Eastern Shore.

The Second Annual Award for Excellence in Organized Medicine, an award created to encourage medical student involvement in organized medicine, was also presented during the Annual Meeting. Elliott E. Cazes from the University of Maryland School of Medicine and Martin J. Citardi from The Johns Hopkins School of Medicine were the recipients.

The Public Relations Committee sponsored the Eleventh Annual Photo Contest. Faculty and Auxiliary members entered over thirty-three photos which were judged by Evan Cohen, a professional photographer from Baltimore. David A. Paul MD won first place and Michael Liteanu MD won second place. All entries in the photo contest were on display during the Annual Meeting.

Certificates of Recognition were presented during the House of Delegates Session of the Annual Meeting to three physicians for their outstanding service and dedication as chairpersons of Med Chi committees. President Reynaldo L. Lee-Llacer MD presented certificates to Fred A. Gill MD, Chairperson of the Committee on AIDS; John G. Bartlett MD, Vice Chairperson of the Committee on AIDS; Sidney B. Seidman MD, Chairperson of the Peer Review Committee; and Stanley R. Platman MD, Chairperson of the Committee on Physician Rehabilitation.

This year, the Public Relations Committee successfully concentrated its efforts on a single program with the goal of enhancing the image of the physician in the eyes of the public. The Committee strongly believes the Doctor/Lawyer/Teacher Partnership Against Drugs (and programs like it) is a step in the right direction to improving the physician's image within the community. The Committee welcomes comments and suggestions from Med Chi members regarding all its activities. As Chairperson, I thank the members of my Committee whose time and effort have made this a productive year.

## Committee on Scientific Activity

*Mr. President and Members of the House of Delegates:*

**T**he Committee on Scientific Activity had seven meetings during this past year. Recommendations to the Executive Committee included adoption of a guide for joint sponsorship of programs which would include policies and procedures. This was accepted. Copies are now available for distribution to all applicants seeking joint sponsorship of continuing medical education (CME) activities by Med Chi. The Committee was integrally involved in the planning, presentation, and evaluation of twenty-three jointly sponsored activities during this reporting period.

The 1990 Semiannual Meeting was held at the Carousel Hotel and Resort in Ocean City, September 14 to 16. The keynote speaker, American Medical Association (AMA) Trustee Robert McAfee MD, addressed the opening session on the topic of "Will We Care About Caring?" Also featured was a symposium on "Maryland Access to Care" with presentations by Mary Mussman MD and Nelson Sabatini of the Maryland Department of Health and Mental Hygiene.

The 1991 Annual Meeting was held at the University of Maryland, University College, Center of Adult Education, College Park, May 8 to 10. Highlights of the program included presentations by Lt. Governor Melvin Steinberg; The Reverend Joseph A. Sellinger SJ, President, Loyola College in Maryland; C. John Tupper MD, AMA President; and Congressman Steny Hoyer.

On behalf of the Committee on Scientific Activity, I wish to express my appreciation to each member and to the staff of Med Chi for their contribution of time and effort in making these programs and activities so well-received and worthwhile.

Jose Martinez MD*

*More than 75 scientific and technical exhibitors were available for physicians attending this year's Annual Meeting.*

## Committee on Small Area Practice Variation

*Mr. President and Members of the House of Delegates:*

**D**uring the 1990-1991 year, the Committee on Small Area Practice Variation discussed the feasibility of continuing as a standing committee since other committees at Med Chi had been formed to address medical practice issues. Duplication of effort and coordination of activities were seriously considered and debated.

In an effort to gather information on small area practice variation activities being conducted by outside agencies, the Committee invited Daniel T. McCrone MD, President, Chief Operating Officer, and Lyn Book Starr, Manager, Systems Development, Maryland Medical Services, Inc., to make a presentation to Committee members. (Maryland Medical Services, Inc. (MMS) is the second largest subsidiary of Blue Cross/Blue Shield. It reviews medical policies and has recently taken over provider review, focusing on small area practice variation.) At the presentation, Dr. McCrone explained the study MMS conducted on the Eastern Shore that focused on the cost per claim of gastroenterologists practicing in that area. He also discussed the fact that consumer dissatisfaction and marketplace competition required that more provider information be made available to the consumer. Dr. McCrone expressed optimism that MMS and Med Chi could work together to review provider information. While Dr. McCrone's studies appeared to target only provider costs, Committee members noted that Med Chi should review identified problem areas, focusing on educating the provider population.

Other Committee activities included investigating the availability of grant money for studies on small area practice variation.

## Committee on Specialist Identification

*Mr. President and Members of the House of Delegates:*

**T**he Committee on Specialist Identification has held five meetings this past year to implement the mandated specialist identification authority of the Board of Physician Quality Assurance (BPQA). This Committee functions as the reviewing body for the BPQA on applications received from physicians requesting designation in a particular medical specialty.

Application for specialty designation is open to all licensed physicians in Maryland. If a physician is certified by the American Board of Medical Specialists, the identification is automatically given by the BPQA upon confirmation of that credential.

If not certified by the American Board of Medical Specialists, the physician must complete an application outlining specific training and experience in the particular specialty. The applications are referred by the BPQA to this Committee for evaluation. Criteria used for such evaluation were developed jointly by Med Chi and the BPQA, and are set forth in administrative regulations (COMAR 10.32.08) having the force and effect of law. The BPQA makes the final decision on the basis of the recommendation from the Committee. The identification is permanent, and the physician may publicize himself or herself in the given area of specialty.

Much time and effort has been exerted in reviewing the 2,583 applications received thus far. Of the applications reviewed, the Committee has recommended that 166 be denied. Each application is reviewed thoroughly and fairly, and in strict compliance with the required criteria.

I wish to thank the members of the Committee for their patience in carrying out this mandated function.

*Donald W. Kress MD*

*Joseph S. McLaughlin MD*

*Hiroshi Nakazawa MD*

*David P. Zajano MD*

## Committee on Specialty Societies

*Mr. President and Members of the House of Delegates:*

**T**he Committee on Specialty Societies is dedicated to the review of interdisciplinary and multidisciplinary issues arising from the practice of medicine as related to each specialty. The Committee provides specialty representation on the Faculty Council (one councilor) and the House of Delegates (seven delegates, seven alternate delegates).

During this Med Chi operational year (1990-1991), the Committee held five meetings. Issues discussed varied from specialist involvement with the State peer review process, to specialty assistance, to the Medicare Program.

At the Committee meeting on May 24, 1990, the Committee reviewed previous year actions including recommendations to the Medical Director of Maryland Blue Cross/Blue Shield-Medicare concerning gastrointestinal (GI) endoscopy and noninvasive vascular testing policies, and actions of the Task Force on Psychiatric Managed Care. The Committee also reviewed the newly published *Peer Review Handbook* and discussed specialty involvement with the peer review management system. Additionally, the Committee discussed the Small Area Practice Variations Program with the Med Chi Committee responsible for that program.

The Committee did not reconvene again until September 27, 1990. At that time, it urged the Council and Executive Committee to meet with the Board of Physician Quality Assurance (BPQA) with the express purpose of clearly defining the BPQA's protocol for the handling of peer review cases to ensure that all quality of care cases are processed through the Faculty. During that meeting, the Committee also agreed to assist the Committee on Small Area Practice Variation in the performance of its endeavors. The agenda also included a review of the State health plan regulations concerning "cardiac surgery and therapeutic catheterization services" and discussions regarding a Medicaid Formulary, the Med Chi Focused Professional Education Program, specialty involvement with managed care programs, and the Maryland Health Systems Cost Review Commission's (HSCRC's) mid-night admission determination related to same day surgery procedures.

On November 15, 1990, the Committee met to review many of the issues discussed during its previous meetings.

One issue that had not been recently addressed was economic credentialing, a subject the Med Chi Committee on Hospital Medical Staffs has been following very closely and the American Medical Association (AMA) has deemed important enough to make it the subject of the Educational Session at the interim AMA-HMSS (Hospital Medical Staffs Section) Meeting in Orlando, Florida, November 29 - December 1, 1990. Other matters discussed at the November meeting included Medicare medical policy regarding pneumatic compressors (lymphedema pumps) and the appropriate specialty identification sign for display by a physician at his or her medical office.

When the Committee reconvened on January 24, 1991, it further discussed its support and willingness to participate in small area practice patterns and activities; it reviewed the status and degree of AMA interest concerning the "Definition of the Hospital Day" as it relates to same day surgery; and it continued to follow Med Chi's involvement with the Medicaid Formulary, and medical radiation technologist and laboratory regulations. At that meeting, the Committee was apprised of the *AMA News* (December 14, 1990) article, "Guidelines on Drug Industry Gifts." The Committee also drafted and submitted to Council a resolution concerning laser surgery.

At the last operational year meeting on March 28, 1991, the Committee finalized its decision regarding the specialty identification sign to be displayed by a physician in his or her office. It also continued to follow medical radiation and office-based laboratory technician regulations, the status of the Medicaid Formulary, and the progress of Med Chi's Focused Professional Education Committee. The Committee was brought up-to-date on the development and status of the Health Care Financing Administration's (HCFA's) global surgery policy wherein the bundling of surgical services for reimbursement purposes is being proposed.

## Ad Hoc Therapeutic and Formulary Committee

*Mr. President and Members of the House of Delegates:*

In August of 1990, an Ad Hoc Therapeutic and Formulary Committee was formed to examine the current therapeutic and formulary system associated with the State's Medical Assistance Program (MAP). Representatives from the Department of Health and Mental Hygiene (DHMH), the University of Maryland School of Pharmacy, and the Pharmaceutical Manufacturers Association were invited to attend the Committee meetings to share their perspectives and findings.

After careful deliberation, the Committee decided its objectives should include the following: (1) identify and investigate studies and reports addressing the effectiveness of therapeutic formularies; (2) urge pharmaceutical companies to offer the best price to the Medical Assistance Program through discounts and rebates; (3) plan an informational and educational campaign for physicians regarding the prescribing of less costly medications of equivalent therapeutic value; (4) support the State's Medical Assistance Pharmacy Program, recognizing that other states have moved from a restrictive formulary to an open system; and (5) ensure that any preauthorization mechanism that may be developed and approved by Med Chi be flexible enough to allow for ease of physician and patient access.

Topics for discussion have included federal legislation regarding reimbursement for prescribed drugs, preauthorization mechanisms, and proposed interventions to control medication costs in the Maryland Medical Assistance Program. After examining and discussing the available data, committee members stressed the need to work cooperatively to develop an educational program for Maryland physicians relating to appropriate cost-effective prescribing. The University of Maryland School of Pharmacy, in conjunction with Med Chi, will be developing this program.

## Women in Medicine Ad Hoc Committee

*Mr. President and Members of the House of Delegates:*

During 1990-91, the Women in Medicine Ad Hoc Committee worked to fulfill its primary goal of increasing women's membership in Med Chi and encouraging women physicians to become actively involved in the leadership of organized medicine at all levels -- county, state, and national.

To achieve this goal, the Committee sponsored a reception for women physicians during the Annual Meeting in May 1991. In an attempt to persuade nonmember women physicians in Maryland to participate in organized medicine, the Committee sent invitations to all women members of Med Chi in Prince George's and Montgomery County. The invitation encouraged members to bring a nonmember to the reception.

In September 1990, the Committee mailed a memorandum and flyer promoting the American Medical Association's (AMA's) "Women in Medicine Month" to all Med Chi Component Society, Specialty Society, and Hospital Medical Staff presidents. Physicians were encouraged to invite nonmember women physicians to a special meeting at the Faculty where they could discuss problems unique to women physicians and determine ways organized medicine could help solve them.

Another major goal of the Committee is to increase the availability of childcare facilities for working physician parents. This year, the Committee focused on childcare for physician parents who are on call at hospitals. The AMA recently expressed its strong support for the development of proper childcare facilities for families of working parents and encouraged the availability of childcare facilities in or near medical centers and hospitals. At its Interim Meeting in December 1990, the AMA adopted the following recommendations relating to childcare in hospitals:

- The AMA strongly encourages hospitals to establish and support childcare facilities.
- The AMA encourages that priority be given to children of those in training (residents), and that services be structured to take their needs into consideration.
- The AMA should inform the American Hospital Association, hospital medical staffs, and residency program directors of these policies.
- The AMA should study the elements of quality childcare and the availability of childcare on a twenty-four-hour basis.

Carol Garvey MD raises several questions during the presentation on the "Maryland Access to Care Program."

In May 1991, the Committee sponsored a session during the Med Chi Annual Meeting, "Sexuality in Children." During the session, Pediatrician Joan Barkin MD provided an overview of "Sexuality in Childhood"; Psychiatrist Steven Lipsius MD gave a synopsis of "Normal Sexual Development"; and Michael Meagher MD, Clinical Assistant Professor of Psychiatry at the Georgetown University of Maryland, spoke on "Abnormal Sexual Development." The Committee hopes this and other sessions on childhood development will be beneficial to physician parents.

Other goals of the Committee include support and social groups for women physicians, seminars to help women physicians function with job and family stress, and a round table discussion by women physicians and medical students to discuss various issues perceived to be unique to working women physicians.

The members of the Women in Medicine Ad Hoc Committee thank Med Chi for the opportunity of serving on this Committee. We welcome any comments or suggestions for future activities from all physicians.

## Committee on Young Physicians

*Mr. President and Members of the House of Delegates:*

The Committee on Young Physicians began the 1990-1991 year by reviewing Med Chi's survey of young physicians under forty years of age or in practice less than five years. This survey, which was completed by 466 young physicians, provided an overview of their problems and the services they felt Med Chi should offer to help them in their practices.

Committee discussion of the problems facing young physicians resulted in the members deciding to concentrate on increasing young physician membership by providing them with a package of services designed to meet their particular needs. These services would be offered at a discount rate as a benefit of joining Med Chi.

Committee members focused on the following issues: placement services, accounting services, computer services, billing services, practice workshops, and legal services. Committee members volunteered to gather information on the above-mentioned services and negotiate discounts for young physicians.

The Committee's present goal is to produce a brochure depicting the services that can be offered to young physicians at a discounted rate when they join Med Chi. This brochure will be presented to the Executive Committee and Council for their approval and input.

Two members of the Committee attended the American Medical Association's (AMA's) Interim Meeting in Florida, bringing back valuable information about the issues concerning young physicians at the national level. These issues will be carefully followed in the coming year.

At the Annual Meeting, the Committee sponsored, "Being on the Hot Seat," -- an overview of the Health Claims Arbitration Process and demonstration of mock depositions of an expert witness and defendant physician in a medical malpractice suit.

The Committee is dedicated to assisting young physicians with their practices and stimulating interest and participation in organized medicine.

Meridian Nursing Center—Heritage

#### **Partners in Healthcare**

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer's patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at all our nursing centers. And special services like short-term or respite care, our own

pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

# Consultation

**SPEAK OUT SPEAK OUT SPEAK OUT SPEAK OUT SPEAK OUT SPEAK OUT**

Consultation, a twice-weekly radio program sponsored by the Medical and Chirurgical faculty of Maryland allows Med Chi physicians to discuss the latest developments in medicine and to answer questions about health issues.

Med Chi currently airs two sessions of Consultation weekly:

## Consultation "Live"

An hour-long program  
Airs Sunday from 2 to 3 pm  
Broadcast across the country including  
WNAV 1430AM in Annapolis  
Call-in Format

## Consultation "Pretaped"

A half-hour program  
Airs Sunday from 7:30 to 8 am  
Broadcast on WBAL- AM radio  
Interview format

Med Chi encourages all physicians to appear on these innovative programs.

## American Medical Association - Education and Research Foundation Report

Mr. President and Members of the House of Delegates:

It is with much pleasure that I present for your consideration this report of Faculty members' contributions to the cause of Medicine in Maryland: American Medical Association - Education and Research Foundation (AMA-ERF).

The staunch support and generosity of Med Chi Faculty members certainly will be welcomed by the deans of the designated medical schools. For, as you know, the flexible funds of AMA-ERF help to sustain and maintain a degree of excellence which *all* medical schools strive to attain.

With federal and state funding at an all time low, the only foreseeable help in the form of financial assistance *must* come from the medical family, I can honestly state that loyal Faculty members have once again responded to that call.

As State Chairperson of AMA-ERF, I wish to convey my sincere, grateful thanks to each and *all*. It has been my great privilege to serve as State Chairperson for the Faculty. Thank you for this opportunity.

### ■ Faculty Contributions

June 1, 1990 - April 30, 1991

Allegany County	\$685.00
Anne Arundel County	2,060.00

### ■ Maryland Physicians' Direct Contributions

May 1990 - March 1991

\$9,976.00

Elizabeth A. Linhardt, State Chairperson

Col. Robert Fechner of the Uniformed Services University of Health Sciences thanks Med Chi and the AMA/ERF for its donation.

## Auxiliary Report

Mr. President and Members of the House of Delegates:

Maryland has thirteen component Medical Auxiliaries -- from Allegany County in the west to Wicomico County in the east. We have almost 1,300 members and have just celebrated our forty-second year.

One of the most rewarding jobs of a President is to give an account of the members' accomplishments. In keeping with the theme, "Teamwork For a Better Image," component auxiliaries have been promoting various community projects. Anne Arundel County has been maintaining the Charles Ballard Senior Center offering exercise programs to 100 senior participants. One of their members, Imelda Herzinger, received an award from the Governor for outstanding service to the community. Washington County's project, "Elder Love," a support group for people caring for elder relatives, provides forums at which caregivers may share their feelings and frustrations. This project was featured in the July 1990 issue of *Facets*, an American Medical Association (AMA) Auxiliary publication. Wicomico County has

Auxiliary Past President Victoria Cameron (left) presents outgoing President Josie Figueroa with a Past President pin.

been promoting AIDS education programs in schools. Most counties participated in "Holiday Sharing Card" for AMA-ERF (Educational Research Foundation). Through various fund-raising projects, several counties gave scholarships to students pursuing health-related careers.

Maryland's entry for Medical Heritage on the life of Dr. Walter Edward Dandy, a pioneer neurosurgeon from Johns Hopkins, won second place at the Southern Medical Association Auxiliary State Exhibits.

Past State President, Mildred Taylor, current President of the Howard County Medical Society, was elected the Northern Region Vice President of the Southern Medical Association Auxiliary.

To sustain a good working relationship with the State legislature, our annual "Auxiliary Day in Annapolis" was held January 29, 1991. Included in the agenda were legislative briefings and lunch with legislators. A resolution in recognition of the Auxiliary's contributions to health education and the promotion of quality health care was presented by Lt. Governor Melvin Steinberg.

At the Statehouse ceremony in Annapolis, March 19, 1991, the Auxiliary received a proclamation from the Governor declaring March 30, Doctors' Day. Component auxiliaries celebrated Doctors' Day in a variety of events.

In response to the AMA Auxiliary's memorandum, each member was encouraged to join the "Give a Gift of Support" project. Auxiliary members were asked to offer support to the families of physicians serving in the Persian Gulf. Special commemorative Doctors' Day postcards were sent to Maryland physicians who were part of Operation Desert Storm.

These are just some of the many activities engaged in by the component auxiliaries. Each of the thirteen counties is unique in its own way, but every component auxiliary is working toward a common goal -- promoting the theme of the year.

I would like to take this opportunity to thank you, each and every Auxiliary member.

*Josefina D. Figueroa, President*

## Executive Director's Report

*Mr. President and Members of the House of Delegates:*

With the guidance and support of its membership, Med Chi addressed many of the concerns facing Maryland physicians during 1990-1991. This report highlights several of Med Chi's accomplishments during this past year.

### ■ 1991 Legislative Session

A great majority of Med Chi's challenges occurred during the 1991 session of the Maryland General Assembly. Through the efforts of many dedicated Maryland physicians, Med Chi helped contribute to the passage of several laws benefiting the public's health. Med Chi also limited excessive government regulation of Medicine by working to defeat bills such as Mandated Medicare Assignment, triPLICATE prescriptions, and the regulation of fees of radiologists, anesthesiologists, and pathologists.

During the Session, Med Chi held its annual legislative rally to allow Med Chi physicians an opportunity to discuss their concerns about Maryland Medicine with their representatives. Lieutenant Governor Melvin A. Steinberg and Senate President Thomas V. "Mike" Miller were among the more than a dozen legislators who attended or addressed physicians in the Maryland Statehouse.

### ■ Smoking

This year's rally focused on a number of bills aimed at preventing young people from becoming smokers. In cooperation with the Maryland Chapters of the American Cancer Society, the American Heart Association, and the American Lung Association, Med Chi lobbied in support of bills to restrict minors' access to cigarettes and to increase the cigarette tax. As a result of this coordinated effort, the Legislature voted to increase the excise tax on cigarettes for the first time in ten years and to apply a State sales tax on cigarettes for the first time.

### ■ Abortion

The Legislature passed a new abortion law allowing physicians to refrain from notifying a minor's parents if the physician determines the minor is "mature and capable of giving informed consent" or if informing the parents "would not be in the interest of the minor."

Med Chi took no position on this bill but did provide information on the current abortion statute and its effects on medical practice. Med Chi published a copy of the changes made to the Maryland abortion law in the May issue of the

**MMJ.** Med Chi is currently studying the new law and plans to provide physicians with guidelines to facilitate compliance with the law.

## ■ AIDS

In February, Med Chi revised the Faculty's Position on AIDS to support legislation for mandatory testing of sources of significant HIV exposure to health care workers. Med Chi physicians testified in favor of Senate Bill 203 which provides for testing of certain individuals without informed consent in cases where patients are unable to give consent (e.g., comatose patients). As passed by the Legislature, this bill states that Med Chi, in consultation with the Centers for Disease Control, the Maryland Hospital Association, and the Department of Health and Mental Hygiene (DHMH), shall develop a practice protocol for physicians infected with HIV and submit this report to the Legislature on December 2, 1991. Med Chi will develop this protocol and present a draft report during the Semiannual Meeting in September.

## ■ Radiation Technologists

House Bill 408 introduced regulations that would have required all physicians who offer x-ray services to their patients to employ a radiation technologist. As passed, the bill includes an amendment requiring Med Chi and the Board of Physician Quality Assurance (BPQA) to create a new class of x-ray assistant who may perform simple x-rays under the direct supervision of a physician. A report on this issue is due to the Senate Finance Committee and House Environmental Matters Committee on December 2, 1991. A draft report will be presented during the 1991 Semiannual Meeting.

## ■ Mammography Screening

For the fourth consecutive year, legislation was introduced that would require physicians who perform mammography to obtain accreditation from the American College of Radiology (ACR). Med Chi opposed this legislation as originally proposed. However, as amended and passed, the bill allows for ACR accreditation and Health Care Financing Administration (HCFA) accreditation, as well as accreditation by a new program to be developed jointly by Med Chi, the Maryland Radiological Association, and DHMH. A draft of this program will be presented during September's Semiannual Meeting.

## ■ Board of Physician Quality Assurance

A bill increasing the resources for the BPQA and its case load was passed during the 1991 Session. This legislation establishes a BPQA Assurance Fund and a Board of Nursing Fund to be used to help both boards cover costs associated with fulfilling their responsibilities.

Throughout this past year, Med Chi has addressed issues of BPQA policy; physician immunity from legal action; outstanding cases at the Faculty and component societies; the mini-evaluation by the State Department of Fiscal Services; and BPQA vacancies. Physicians should note that Med Chi's position on peer review is and will remain that review of medical practices should only be done by physician peers. Med Chi will make every effort to insure that this activity remains with physicians.

## ■ Medical Assistance Program

Last year the DHMH introduced the Maryland Access to Care (MAC) program. Under MAC, physicians will provide primary medical care to Medicaid recipients. Medicaid recipients will be required to choose a physician, provider group, or clinic to serve as their primary care provider. The change in the Medicaid program represents a commitment to shift care to community providers and, at the same time, increase fees for some visits by an average of 50 percent. Thus far, Maryland physicians have strongly supported this program, verifying and reinforcing Med Chi's dedication to providing primary care to Maryland's neediest citizens.

DHMH also developed a Medicaid Funding Program to provide an additional \$70 million in support of the Medical Assistance Program.

## ■ Medicare

In addition to defeating Mandated Medicare Assignment in Annapolis, Med Chi also worked at the federal level to help eliminate superfluous government regulations in the Medicare program by supporting HR 4475, "Medicare Physician Regulation Relief Amendments." This bill would relieve physicians from several of Medicare's unnecessary administrative burdens. To show its support for this legislation, Med Chi sent letters to all Maryland U.S. Representatives.

In a related issue, Med Chi sent a letter to President Bush

Med Chi President Reynaldo L. Lee-Uacer MD (far left) and Executive Director Angelo J. Troisi FACHE (far right) escort AMA President C. John Tupper MD and his wife, Mary, to Med Chi's 193rd Annual Meeting.

calling for the dismissal of Department of Health and Human Services Inspector Richard Kusserow for his negative and reported overzealous activities in Medicare and Medicaid fraud investigations. All component and specialty societies in Maryland were encouraged to express their indignation to those methods of inappropriate investigation.

### ■ Health Access America

In response to calls for national health insurance, the AMA developed Health Access America, a program to provide access to high quality health care for all Americans at affordable prices. Med Chi has expressed its support of Health Access America and has disseminated details about the program via informative lectures throughout the State.

### ■ State and Federal Laboratory Regulations

Med Chi has been actively involved with DHMH and HCFA in the development of laboratory regulations suitable to the health care community. In April, the *Federal Register* contained proposed rules for sanctions that HCFA may impose on laboratories not meeting federal requirements. Copies of these rules were mailed to all component and specialty societies for dissemination to their members.

### ■ Liability Insurance

In December, Medical Mutual announced a 20 percent dividend credit off their total professional liability insurance premium for physicians who renew their policies in 1991. This credit, which is in addition to any other discount members may receive, is the direct result of the cumulative effects of tort reform and insurance legislation as coordinated by Med Mutual and the physicians of Maryland.

Beginning in 1991, Med Chi is cosponsoring a seminar with Medical Mutual entitled, "Medical Records: Charting a Course for the 1990s." Physicians attending this conference will receive a 5 percent discount on their 1992 Medical Mutual renewal premium.

### ■ Physician Rehabilitation

In an effort to reach all Maryland physicians, Med Chi's Physician Rehabilitation Program was expanded through an additional physician state licensure assessment. The Program now includes an outreach program, extensive drug abuse education, a program newspaper - *Straight Forward*, and focused education for physicians requiring improvement in their professional skills.

### ■ Meetings and Continuing Medical Education

In an attempt to address the concerns of physicians throughout the State, Med Chi continued its tradition of President's Regional Conferences, holding several meetings

in western, eastern, and southern Maryland. Physicians attending these meetings were provided with updates on statewide medical issues and were briefed on new Med Chi programs and events. Many of the meetings provided opportunities to obtain continuing medical education (CME) credits on a variety of medical subjects.

Med Chi's Semiannual Meeting was held September 14-16, 1990 at the Carousel Hotel and Resort in Ocean City, Maryland. AMA Trustee Robert McAfee MD, keynote speaker for the meeting, addressed the physician's commitment to providing quality care for patients. Other seminar topics included physician payment reform, the impact of regulation on physicians' offices, and the Maryland Access to Care program.

In October, Med Chi's Committees on Physician Rehabilitation and on Drugs sponsored "Practical Clinical Management: Drug Abuse Education for the Primary Care Physician." More than 300 physicians attended this conference designed to increase a physician's ability to recognize, treat, and prevent drug abuse in his or her patients. In an effort to continue drug abuse education for physicians, Med Chi published a monograph of conference proceedings and plans to offer a second drug conference in November 1991.

"American Medicine Today: Perspectives from Maryland," was the theme of Med Chi's 193rd Annual Meeting held on May 8-10, 1991 at the University of Maryland Center of Adult Education in College Park, Maryland. This year's program featured several nationally recognized guest speakers including:

- C. John Tupper MD,  
President of the American Medical Association;
- The Honorable Melvin A. Steinberg,  
Lieutenant Governor of Maryland;
- The Honorable Steny H. Hoyer,  
U.S. Representative (D, MD);
- Parris N. Glendenning,  
County Executive of Prince George's County; and
- The Reverend Joseph A. Sellinger,  
President of Loyola College in Maryland.

Maryland physicians had the opportunity to attend numerous scientific sessions and discuss important medical issues such as AIDS, the right to die, breast cancer, Medicare, Medicaid, and drugs.

### ■ Doctor/Lawyer/Teacher Partnership Against Drugs

In September, Med Chi initiated its Doctor/Lawyer/Teacher Partnership Against Drugs, a new program in which doctor/lawyer educational teams visit schools to talk with stu-

dents about the medical and legal dangers of drug and alcohol use. In the spring of this year, more than 7,000 students across the State were visited by more than 250 physician and lawyer volunteers. In May, AMA President C. John Tupper MD presented Med Chi with a special award for this program.

#### ■ Physician's Practice Digest

In October, Med Chi introduced the *Physician's Practice Digest* (PPD), a new quarterly publication to meet a physician's practice management needs. The publication was met with an overwhelmingly enthusiastic response from the membership. In May, the PPD won a special award in the Sandoz Pharmaceutical National Competition for Excellence in Medical Journalism.

On behalf of all Med Chi staff, I would like to express our thanks to all the physicians who have actively participated as Med Chi members. Your contributions to Med Chi will help create a bright future for the Maryland Family of Medicine.

Angelo J. Troisi FACHE, Executive Director

## House of Delegates Report -- 1990 Interim Meeting of the AMA House of Delegates

Mr. President and Members of the House of Delegates:

The American Medical Association (AMA) House of Delegates met in Orlando, December 2-5, 1990. This was the busiest House meeting on record with 194 resolutions and 106 Board and Council reports to consider. The House adopted policy on a wide variety of national issues of critical importance to the practicing physician and the American public.

There were 435 delegates seated. The House composition was:

- 348 delegates representing state medical associations;
- 77 delegates representing national medical specialty societies; and
- ten delegates representing medical students, resident physicians, hospital medical staffs, medical schools, young physicians, the Army, the Air Force, the

Navy, the United States Public Health Service, and the Veterans Administration.

#### ■ Address of the President

C. John Tupper MD, AMA President, gave a stirring midyear report on the AMA's many achievements in the last few months, which he termed a "veritable parade of progress."

In recalling his Inaugural Address, Dr. Tupper promised that the "new AMA would be up front, where the action is." Saying that the AMA had kept that promise, Dr. Tupper heralded many aggressive actions and a new willingness to take risks and "to stand up for our profession in many other ways when the chips are down." Topping his list were:

- the AMA's call for removal of Inspector General Richard Kusserow from his position;
- the success of AMA's Washington office staff in "looking out for the interest of our patients and in lobbying against government programs and policies that are anti-science and anti-patient";
- the stance of the Council on Ethical and Judicial Affairs on such vital issues as the physician's duty to treat HIV patients, withdrawal of life support, and other public health and public education issues;
- the AMA's leadership role in the development of practice parameters as a way of improving the quality of care patients will receive; and
- the AMA's proposal to extend quality medical care to everyone (Health Access America) has received the support of many state, county, and national specialty societies.

Declaring that "the new AMA is more effective at our number one job - the job of representation," Dr. Tupper said, "By putting together all the attributes of the new AMA -- strength, boldness, imagination, and our leadership in education and quality -- we are better able to stand up effectively for physicians and for our patients."

#### ■ AMA Budget - Fiscal Year 1991

The Board of Trustees presented the 1991 Plan and Budget calling for \$189.8 million in operating revenues and \$186.0 million in operating expenses. Budgeted income taxes and non-operating expenses of \$1.7 million and \$2.0 million, respectively, leave the Association with a bottom line of \$136,000. There will be *no* dues increase in 1991.

AMA President C. John Tupper MD presents the AMA's view of Health Access America.

The four areas of major focus for 1991 are: professionalism/standard setting, physician autonomy, the health of the public, and support and service activity.

#### ■ Gifts to Physicians from Industry

The AMA Council on Ethical and Judicial Affairs submitted its opinion on gifts to physicians from industry and provided guidelines to avoid the acceptance of inappropriate gifts. In a related report, the Council discussed the ethical issues raised by the practice of industry gift-giving including the influence on physician practices, the appearance of impropriety, and costs of gifts.

#### ■ Physician Participation in State Executions

Prompted by reports of physician involvement in an execution by lethal injection in Illinois, the House adopted a resolution that reaffirmed AMA's ethical position in opposition to physician participation in legally authorized executions, and informed state medical licensing boards and certification agencies that physician participation in lethal injection executions is a serious ethical violation.

#### ■ Denial of Payment for Preexisting Conditions

The issue of health insurance companies denying payment for preexisting conditions generated much debate in the Reference Committee. Some spoke to the detrimental impact of coverage of preexisting conditions on the fiscal viability of insurers. Others stressed the need for physicians to serve first and foremost as advocates for their patients and

encouraged the elimination of preexisting condition limitations.

The House opted to adopt a substitute resolution calling for a comprehensive study in conjunction with health insurance industry representatives, to include:

- an evaluation of administrative and marketing costs,
- the appropriateness of experience and community rating,
- exclusions from coverage for preexisting conditions and other insurance underwriting practices,
- recommendations for health insurance reform, and
- an evaluation of timely access to medically appropriate health care services and technology

A report is anticipated at the 1991 Interim Meeting.

#### ■ Department of Health and Human Services Inspector General

The delegates heard vehement and unanimous testimony reciting the numerous inappropriate and questionable activities of the Office of Inspector General of the Department of Health and Human Services (HHS) and in support of the AMA's efforts to gain the removal of Mr. Kusserow from the position.

The House adopted a resolution calling on the AMA to:

- continue its actions to seek the immediate resignation or dismissal of Richard Kusserow as Inspector General and
- to encourage state, specialty, and auxiliary organizations, as well as individual physicians to write President George Bush, Dr. Louis Sullivan, and members of Congress in an effort to effect Mr. Kusserow's ouster.

#### ■ Patient Transfer Provisions

The law (COBRA - Consolidated Omnibus Budget Reconciliation Act) setting out penalties for inappropriate patient transfers received considerable attention demonstrating a need to continue AMA activities pressing for appropriate changes in how the law is written and how the courts interpret the law, especially as it relates to malpractice cases.

The House adopted a resolution calling on the AMA to seek legal or legislative opportunities to clarify that this law applies only to inappropriate transfers from hospital emergency departments and not to issues of malpractice, and to seek appropriate modifications of the law to preclude liability for discharges from the

hospital, including the emergency department and outpatient facility.

#### ■ Electrocardiogram Interpretation

The Omnibus Budget Reconciliation of 1990 (OBRA 1990), which was recently signed into law, contains provisions eliminating a separate Medicare payment for electrocardiogram (EKG) interpretation. The House agreed to accept an emergency resolution on this issue and took action calling on the AMA to establish a high priority to effect repeal of those provisions included in the law eliminating Medicare payment in 1992 and beyond for routine reading of EKGs, where the EKG is performed and payment is made to a physician as part of a visit or consultation.

#### ■ Use of Animals in Research and Medical Education

The House approved a report from the Council on Scientific Affairs reviewing the use of animals in medical education, including the policies of many medical schools and national organizations. The Council reaffirmed the necessity for humane treatment of experimental animals used in medical education and recommended the following guidelines on the use of animals in medical school curricula: (adopted as amended)

1. Where appropriate, medical school faculty should consider using non-animal models in education activities; when animals are used in the curriculum, educational goals should be clearly stipulated.
2. Each medical school should disseminate to students before matriculation a policy statement regarding their participation in educational experiences involving animals.
3. All educational experiences involving animals should have the approval of the Institutional Animal Care and Use Committee.
4. Involved faculty should discuss with students the learning objectives of any educational experience utilizing animals, and faculty should remain available throughout the laboratory exercise for advice and guidance on the conduct of the educational experience.
5. All educational experiences involving animals should be carried out in a humane manner without inflicting pain on the animal; this includes the appropriate use of anesthetic and analgesic drugs.
6. At the conclusion of study, animals should be

euthanized in the manner described by the American Veterinary Medical Association.

The House also approved a resolution calling on the AMA to urge state and county medical societies to support the appropriate and humane use of animals in research and to help ensure the continued availability of animals for essential medical education and medical research; and to study the need for and feasibility of a permanent staff resource to coordinate the efforts of the state and county medical societies.

#### ■ Drug Abuse

The House adopted a resolution encouraging every physician to make a commitment to join his or her community in attempting to eliminate drug abuse by the year 2000.

The commitment should include involvement in at least one of the following activities:

- donating money to a drug abuse prevention program;
- donating time to talk to local civic groups, schools, religious institutions, and other appropriate groups about drug abuse;
- joining or organizing local groups dedicated to drug abuse prevention;
- talking to youth groups about brain damage and other deleterious effects of drug abuse; or
- educating and supporting legislators, office-holders, and local leaders on ending the drug abuse crisis.

#### ■ Rural Physician Shortage

The House approved a thorough and detailed report by the Council on Medical Education addressing the complex problems of providing health care services in rural areas and the shortage of physicians in rural areas.

The report presented the following recommendations calling on the AMA to:

- Encourage medical schools and residency programs to develop educationally sound, rural clinical preceptorships and rotations consistent with educational and training requirements, and to provide early and continuing exposure to those programs for medical students and residents.
- Encourage medical schools to develop educationally sound primary care residencies in smaller communities with the goal of educating and recruiting more rural physicians.

- Encourage state and county medical societies to support state legislative efforts in developing scholarship and loan programs for future rural physicians.
- Encourage state and county medical societies and local medical schools to develop outreach and recruitment programs in rural counties to attract promising high school and college students to the health professions.
- Urge continued federal and state legislative support for funding of Area Health Education Centers (AHECs) for rural and other underserved areas.
- Continue to support full appropriation for the National Health Service Corps Scholarship Program, with the proviso that medical schools serving states with large rural underserved populations should have a priority and significant voice in the selection of recipients for those scholarships.
- Support full funding of the new federal National Health Service Corps loan repayment program.
- Encourage continued legislative support of the research studies being conducted by the Rural Health Research Centers funded by the National Office of Rural Health in the Department of Health and Human Services (DHHS).
- Continue investigation into the impact of educational programs on the supply of rural physicians.
- Continue to conduct research and monitor other progress in the development of educational strategies for alleviating rural physician shortages.
- Reaffirm support for legislation making interest payments on student debt tax deductible.
- Encourage state and county medical societies to develop programs to enhance work opportunities and social support systems for spouses of rural practitioners.

#### ■ Residency/Fellowship Working Hours and Supervision

The House approved a substitute resolution asking the AMA to continue to work with the Accreditation Council for Graduate Medical Education to implement AMA policy for residency work hours reform, and to use existing policy as a guideline in working with state medical societies to obtain modification, if needed, of pending future legislation on total residency work hours, conditions, and supervision.

#### ■ National Practitioner Data Bank

The House received six resolutions about problems associated with the National Practitioner Data Bank. The Reference Committee formulated a substitute resolution that was adopted, along with a resolution submitted by the Hospital Medical Staff Section.

The delegates voted to ask the AMA:

- to continue to work with the DHHS to ensure that the National Practitioner Data Bank does not collect nor release information regarding the denial of specific clinical privileges based solely on failure to meet hospital-established minimal criteria (e.g., level of professional liability coverage, board certification) not related to a physician's competence or professional conduct;
- to continue to work with DHHS to revise the current Data Bank dispute process to accelerate a physician's opportunity to attach an explanation or statement to a disputed report;
- to work with DHHS to establish an appropriate response time for hospital inquiries to the Data Bank;
- to work with DHHS to establish a mechanism to inform physicians when an inquiry to the Data Bank has been made;
- to reaffirm its policy that reports in the Data Bank, other than licensure revocation, should be purged after five years;
- to support efforts to require the same Data Bank reporting requirements for physicians, dentists, and other licensed health care practitioners;
- to reaffirm its policy and use all necessary efforts to direct the National Practitioner Data Bank to send all notifications to physicians by certified mail, return receipt requested; and
- to use all necessary efforts at the federal level to direct the National Practitioner Data Bank to begin the sixty-day appeal process from the date the physician receives notification.

#### ■ PRO Notification of Quality Problems

The Council on Medical Service submitted a report discussing the Professional Review Organization's (PRO's) Quality Intervention Plan (QIP) and the procedures for PRO notification of quality problems. The Council submitted recommendations which were adopted after modification by the House of Delegates.

The delegates voted to ask the AMA:

- to urge the Health Care Financing Administration (HCFA) to modify regulations so that (1) in regard to confirmed quality problems which have been *finally* adjudicated by the PRO Quality Assurance Committee, the PRO is required to notify both the physician and president of the hospital medical staff in all such cases; and (2) the PRO is required to implement a mechanism to verify receipt of the PRO's notice of both potential and confirmed quality problems by the physicians;
- to seek an amendment to the PRO law to require that when the PRO review goes beyond the generic screen for review, the physician must be notified within forty-eight hours of the exact reason for said review; and
- to seek an amendment to the PRO law to repeal the existing prohibition on the release, to a PRO-proposed sanctioned physician, of documents or other information produced by a PRO in connection with its deliberation in making quality determinations.

In a related action, the House considered a Joint Report of the Council on Medical Service and the Council on Medical Education examining the implications of HCFA'S guidelines calling for PRO review and sanctions of physicians-in-training. Four resolutions on the issue were submitted.

The House adopted as amended the following recommendations of the two Councils:

- The attending of record not be assigned QIP points when the PRO, in its final determination and after consultation with the program director, has clearly identified the resident in an accredited training program as the source of the problem.
- The AMA urge HCFA to require PROs to notify the responsible training program and resident in an accredited training program as to the quality problem in patient care in instances in which a resident is deemed by a PRO to be responsible for the problem.
- When a resident is deemed by the PRO, in its final determination, to be responsible for the problem, the resident and the program director should receive corrective notification serving to initiate a specific educational corrective action plan for the resident to complete.
- When a resident in an accredited training program

is deemed by a PRO to be responsible for the problem, the AMA urges the provider's training program to develop a corrective action plan (CAP) regarding how it plans to address problems identified under the QIP, and to make the CAP available to the PRO and the accrediting body at the accreditation visit.

- While participating in an accredited training program, residents shall not be assigned any QIP points for activities within their training programs. However, medical activities outside of their training programs may be subject to QIP points.
- Corrective notifications by PROs to residents shall be used only within the training programs and shall remain confidential from all other parties.
- The AMA seek any necessary legislative and regulatory changes in the Medicare program to implement these recommendations.
- The AMA expand both its educational program for physicians on peer review and the QIP program to include residents and medical students.
- The AMA should study the impact of HCFA QIP regulations on graduate medical education.

#### ■ AIDS as a Communicable and a Sexually Transmitted Disease

Although there is still no cure, medical science has developed treatment options that can delay the conversion of a patient who is sero-positive for HIV infection to a patient who is dying from an AIDS-related disease.

With the knowledge that early detection of HIV infection

H. Frank Herling MD (r), Assistant Dean of Student Affairs, The Johns Hopkins University School of Medicine, accepts a check from the AMA-ERF.

is even more imperative than before, the House of Delegates adopted as amended, a resolution supporting "the classification of HIV (AIDS) as a communicable and a sexually transmitted disease (STD), and the control measures attendant to its classification."

The House has asked the Board of Trustees to prepare a report on the question of HIV-testing.

## ■ Resolution Submitted by the Maryland Delegation

The Maryland Delegation submitted the following resolution on "Doctor's Day in Congress" -- Resolution #121:

RESOLVED, That the American Medical Association develop a program to coordinate on a nationwide level a "Doctor's Day in Congress" whereby representatives of each state shall send delegations to Washington to meet with their congressional delegations; and be it further

RESOLVED, That the AMA provide guidelines for meetings of this type with appropriate issues to be presented to members of both the Senate and House of Representatives; and be it further

RESOLVED, That "Doctor's Day in Congress" receive appropriate publicity as to its intent to maintain the quality of medical care being delivered to the American public; and be it further

RESOLVED, That this be an annual event on a specific date each year in order that we maintain our communications as a medical profession with the individual members of Congress.

This resolution was not adopted, but was referred to The Board of Trustees for report back to the House of Delegates.

## ■ Conclusion

The meetings of the AMA House are conducted in a democratic manner. They provide those in attendance a unique educational experience since a wealth of information is disseminated and discussed. All members are encouraged to attend and participate. Any member of the AMA may present testimony to the Reference Committee and corridor discussions on the issues provide additional opportunities for members to get their views across.

If a member cannot come to the meeting, he or she can still be represented through his or her delegate. Members should let their delegation know their opinions. Members may also prepare a resolution and request that it be submitted to the House.

Many AMA policies began with an individual physician who had a good idea and coaxed it through the democratic process.

# Med Chi Insurance Fund Report

*Mr. President and Members of the House of Delegates:*

**T**he Med Chi Insurance Fund Board of Directors governs the Med Chi Agency, the wholly owned subsidiary of the Faculty.

A Preferred Provider Network (PPN) was installed as an endorsed option to other health insurance available to the members. This was done in response to many requests to provide lower cost health plans. The PPN has been very successful, as many members have subscribed to the plan.

The Hartford Group Disability Plan was modified with many enhancements. The Plan now plays a partial disability benefit. It also pays when someone is engaged in rehabilitation employment. A death benefit of three times the disability is provided. Rates are reduced by 20 percent for those under age fifty, and 10 percent for those persons ages fifty to sixty-nine.

A new individual disability policy has been provided through the Monarch Life Insurance Company. Monarch is highly respected in the industry and is one of the top three nationwide companies providing disability income protection coverage.

The Med Chi Agency had a very successful year. The number of Medical Mutual professional liability policy holders was increased substantially and the volume will continue to grow in 1991 and in years ahead.

The Property and Casualty business has also increased. The products are very good and the underwriting companies are rated very high.

It was a profitable year and the membership will benefit as a result. The enthusiastic support of the membership is greatly appreciated.

## Resident Component Society Report

*Mr. President and Members of the House of Delegates:*

**T**he Resident Component Society focused on legislative issues during the 1990-1991 year. Of particular concern to the membership was federal legislation addressing the issue of student loan deferment. With regard to student loan deferment, the President of the Resident Component urged residents to support HR 4690, sponsored by Representative Penny, and S 2796, sponsored by Senator Cohen, by writing their representatives and senators and asking them to cosponsor or support the bills.

The Resident Component also reviewed and discussed resident work hours and the position taken by the Resident Physicians Section of the American Medical Association (AMA). The position urged the AMA to draft and introduce model state legislation to limit residents' work hours, if by September 1, 1991 the Accreditation Council for Graduate Medical Education has not approved final work hour rules, or the nation's residency programs have not all voluntarily adopted work hours. The members are committed to following this issue closely in the coming year.

The Resident Component discussed how to motivate residents to be more active with regard to medical issues. The Component is looking forward to implementing several suggestions made by the membership to stimulate more interest and activity by resident physicians.

*Jeffrey J. Stoddard MD, President*

## Student Component Society Report

*Mr. President and Members of the House of Delegates:*

**T**he Student Component Society was proud to host and cosponsor a seminar for medical students during the 1990-1991 year. This seminar was entitled, "Medicine, Ethics, and the Law," and the program agenda included the following topics: medical ethics, standard of care, informed consent, documentation, living wills, durable powers of attorney for health care, and Health Access America. Speakers at the seminar were: David Orentlicher MD, JD,

Ethics and Health Policy Counsel, Council on Ethical and Judicial Affairs, American Medical Association (AMA); Robert J. Weierman MD, Secretary, Hospital Medical Staffs Section, American Medical Association; Jack Schwartz Esq., Chief Counsel, Opinions and Advice, Office of the Attorney General, Maryland; Melanie Smith Esq., Ethics Committee, The Johns Hopkins Hospital; and Howard L. Sollins Esq., Ober, Kaler, Grimes & Shriver, Baltimore, Maryland.

The seminar was attended by medical students from Washington DC, Maryland, Pennsylvania, New Jersey, and Virginia. This seminar was the first regional meeting of the AMA's Medical Students Section. Due to the success of this meeting and the positive reception by medical students, the Student Component is anxious to participate in further activities to educate its membership and forge relationships with medical students in the region.

*W. David Sullivan, President*

## Treasurer's Report

*Mr. President and Members of the House of Delegates:*

**T**he financial books and records of the Faculty for the year ending December 31, 1990 have been audited by the firm of Naden Lean, Certified Public Accountants.

The financial statements reflecting the financial position of the Faculty at year end 1989 and 1990 and the related statements of income, expenditures, transfers, and changes in fund balances for the years then ended are published in this journal. The auditors submitted an unqualified opinion that the financial statements are accurate and conform to generally accepted accounting principles.

The 1991 Budget was approved by Council in January and is presented in this report for information.

The investment portfolio is included in the report of the Finance Committee.

of Maryland  
Baltimore, Maryland

We have audited the accompanying balance sheet of the Medical and Chirurgical Faculty of Maryland as of December 31, 1990 and 1989, and the related statements of income, expenditures and transfers, and changes in fund balance for the years then ended. These financial statements are the responsibility of the Faculty's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with generally accepted auditing standards. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation. We believe that our audits provide a reasonable basis for our opinion.

In our opinion, the financial statements referred to above present fairly, in all material respects, the financial position of the Medical and Chirurgical Faculty of Maryland at December 31, 1990 and 1989, and the results of its operations and changes in fund balances for the years then ended, in conformity with generally accepted accounting principles.

## Notes to Financial Statements December 31, 1990

### Medical and Chirurgical Faculty of Maryland

#### ■ Note 1

##### Summary of Significant Accounting Policies

The Medical and Chirurgical Faculty of Maryland is a nonprofit organization, tax exempt under Section 501 of the Internal Revenue Code.

Certain items in the December 31, 1989 financial statements have been reclassified to make them comparative with the current year.

The restricted fund represents an assessment established July 1, 1990 by the State of Maryland for the Medical and Chirurgical Faculty of Maryland to conduct a physician rehabilitation program.

Marketable securities are carried at cost. Market values at December 31, 1990 and 1989 were \$2,502,705 and \$2,771,443, respectively.

The Faculty carries its investment in the 100 percent-owned Med Chi Agency, Inc. at equity. The net assets of the Corporation as of December 31, 1990 and 1989 were as follows:

	1990	1989
Current assets	\$431,112	\$744,726
Fixed assets - net	<u>14,626</u>	<u>24,186</u>
	<u>445,738</u>	<u>768,912</u>
Current Liabilities	<u>352,434</u>	<u>695,122</u>
	<u>\$ 93,304</u>	<u>\$ 73,790</u>

The Faculty carries its investment in the 100 percent-owned Management Services Corporation of Med Chi, Inc. at equity. The net assets of the corporation as of December 31, 1990 and 1989 were \$11,629 and \$6,950, respectively.

Fixed assets of the plant fund, other than personal property, are recorded at cost. Portraits were appraised as of December 31, 1963 at \$65,000, an increase of \$51,000 over prior years. All other personal property was appraised as of December 31, 1949. Depreciation on fixed assets is not provided. A schedule of fixed assets follows:

	1990	1989
<b>Real Estate</b>		
<i>1209-1215 Cathedral Street:</i>		
Land and building	\$110,636	\$110,636
Improvements	543,035	543,035

	1990	1989
<i>1205-1207 Cathedral Street and 1204 Maryland Avenue:</i>		
Land and buildings	2,138,624	2,138,624
Improvements	188,296	188,296
<i>224 Main Street, Annapolis:</i>		
Land and buildings	<u>545,856</u>	<u>545,856</u>
	<u>3,526,447</u>	<u>3,526,447</u>
<b>Other</b>		
Library books, journals	231,370	231,370
Office and library - fixtures, antiques and museum pieces	87,570	87,570
Portraits	<u>65,000</u>	<u>65,000</u>
	<u>383,940</u>	<u>383,940</u>
	<u>\$3,910,387</u>	<u>\$3,910,387</u>

Fixed assets of the general fund are recorded at cost and depreciated using the straight-line method over their estimated useful lives for assets acquired prior to 1989, using the accelerated cost recovery system for assets acquired between 1981 and 1986 and the modified accelerated cost recovery system for those acquired after 1986.

A summary of fixed assets is as follows:

	December 31, 1990	December 31, 1989	Life in Years
Automobiles	\$15,700	\$15,700	3
Office equipment and furniture	<u>350,750</u>	<u>308,384</u>	5-10
Total cost	<u>366,450</u>	<u>324,084</u>	
Less: accumulated depreciation	<u>307,112</u>	<u>268,432</u>	
	<u>\$59,338</u>	<u>\$55,652</u>	

Fixed assets of the restricted fund are recorded at cost and depreciated using the modified accelerated cost recovery system.

	December 31, 1990	Life in Years
Office equipment	\$58,519	5
Construction in progress- office renovations	<u>6,539</u>	
Total Cost	<u>65,058</u>	
Less: accumulated depreciation	<u>11,704</u>	
	<u>\$53,354</u>	

Provision for depreciation charged to operations for the years ended December 31, 1990 and 1989 was \$50,385 and \$40,992, respectively.

Deferred income reflects dues and fees collected in November and December for the subsequent year.

■ Note 2  
Loans Receivable

	Amount	Interest	Maturity
Healthcare Credentials Verification, Inc.	<u>\$81,875</u>	10%	2/2/95

■ Note 3  
Pension Plan

The Faculty has a noncontributory pension plan covering substantially all its employees. Pension expense for the current year and prior year were \$132,745 and \$89,408, respectively, which includes amortization of prior service cost over twenty years. The Faculty's policy is to fund pension costs accrued. Actuarially determined pension costs are funded on an annual basis by the Frozen Initial Liability method with initial accrued liabilities computed under the Entry Age Normal Cost method. The most recent accumulated plan benefits and plan net assets for the Faculty is presented below:

	4/1/90
Actuarial Present Value of Accumulated Plan Benefits	
Vested	\$575,252
Nonvested	<u>45,541</u>
	<u>620,793</u>
Net assets available for benefits	<u>1,095,619</u>

The assumed rate of return used in determining the actuarial present value of accumulated plan benefits was 6.5 percent for 1990. The fund's assets as of April 1, 1990 exceeded the vested benefits by \$520,367.

■ Note 4  
Related Parties

The Medical and Chirurgical Faculty of Maryland owns the stock of the Med Chi Agency, Inc. The Faculty leases office space to the Agency under a month-to-month lease. Lease payments from the Agency were \$17,286 per year for 1990 and 1989. Additionally, the Faculty performed certain management and accounting services for the Agency; income for these services was \$105,000 per year in 1990 and 1989.

The Medical and Chirurgical Faculty of Maryland owns the stock of Management Services Corporation of Med Chi, Inc. These were no charges to the Corporation in 1990 and 1989 for management and accounting services performed by the Faculty for the Corporation.

### Outstanding Committee Chairpersons Selected for 1990-1991 Committee Year

Each year, Med Chi's president selects committee chairpersons who have made outstanding contributions to Med Chi to receive certificates of recognition. This year, President Reynaldo L. Lee-LLacer MD honored four physicians for their exceptional service and dedication:

*Fred A. Gill MD*, Chairperson  
Committee on AIDS

*John G. Bartlett MD*, Vice Chairperson  
Committee on AIDS

*Sidney B. Seidman MD*, Chairperson  
Peer Review Committee

*Stanley R. Platman MD*, Chairperson  
Committee on Physician Rehabilitation

Med Chi also presented a special award to *Hiroshi Nakazawa MD* for his work as Statewide Coordinator for the Doctor/Lawyer/Teacher Partnership Against Drugs.

### Two Physicians Win 11th Annual Med Chi Photo Contest

The Public Relations Committee sponsored Med Chi's Eleventh Annual Photo Contest. Med Chi and Auxiliary members entered a total of thirty-three photographs which were judged by Evan Cohen, a freelance and commercial photographer from Baltimore. *David Paul MD* of Baltimore won first place and *Michael Liteanu MD* of Baltimore won second place in the contest. All photographs entered in the contest were on display during the Med Chi Annual Meeting at the University of Maryland Center of Adult Education in College Park.

### Award for Excellence in Organized Medicine

In 1990, Med Chi established an award to recognize contributions made by Maryland medical students to organized medicine. This year, Med Chi received nominations from The Johns Hopkins University School of Medicine and from the University of Maryland School of Medicine. The following two students were selected to receive this award:

*Elliot Cazes* is a senior at the University of Maryland School of Medicine. He has been president of his class for three of his undergraduate years at the University of Maryland. Mr. Cazes is described as being a leader who is responsive to the needs of both his classmates and the school of medicine. He has participated actively in the Curriculum Committee and other school activities. He has also represented students at meeting with the Chancellor of the University of Maryland System. After graduation, Mr. Cazes will continue to study at the University of Maryland in the Department of Obstetrics and Gynecology.

*Martin J. Citardi* is a senior at The Johns Hopkins University School of Medicine. Martin has been politically active throughout his undergraduate years at Johns Hopkins University. He has written several essays on the role of technical advances in medicine. As a student, he has actively taken part in discussions on the relationship between the role of the physician as an advocate for the patient and the physician's role in the profession's technical advances. Mr. Citardi has coined the phrase "technical humanism" to embody his philosophy of using the advances in medicine in a way allowing for the humane delivery of health care. Following graduation, Mr. Citardi plans to pursue residency training in Otolaryngology in the Department of Surgery at the Yale University School of Medicine. ■

## YOUR WILL: a powerful way to help others.

Think about it. Remembering a worthwhile charity in your will is a powerful way to assure that the principles you believe in are supported and that your hard work will help others in the future.

#### SAMPLE BEQUEST PARAGRAPH

which you might wish to share with your attorney: "I give, devise and bequeath unto The Charitable & Educational Foundation (an amount, property or % of one's estate) to be held as an endowment, to be called The (Name of person commemorated and memorialized) Endowment, the income to further the endeavors of the Faculty.

"Physician of the Year," Donald T. Lewers MD, and his wife, Patricia, proudly pose with the 1991 Wyeth-Ayerst Laboratories Award for Community Service.

### Physician Award for Community Service Presented to Donald T. Lewers MD

On May 8, 1991, during the Med Chi Annual Meeting in College Park, Donald T. Lewers MD of Easton, Maryland received the Wyeth-Ayerst Laboratories Physician Award for Community Service for his efforts to preserve the wildlife and the environment of Maryland's Eastern Shore. Formerly the A.H. Robins Award, the Physician Award for Community Service is presented each year to a physician who has provided outstanding service to his or her community outside of the field of medicine.

An internist from Easton, Dr. Lewers has served as a member of the Board of Directors for the Waterfowl Festival in Easton, Maryland for nine years. He was later elected President of the Festival and served for five consecutive years. He has been a member of the Festival's Advisory Board since 1981.

Dr. Lewers' activity as a member of the Board of Directors and as President of the Chesapeake Wildlife Heritage prompted him to serve on the Board of Directors and as President of the National American Wildlife Heritage.

An avid sponsor of Ducks Unlimited, Dr. Lewers was a national trustee for that organization from 1981 to 1985. He has been a Trustee Emeritus for the past six years and, in 1988, he was elected as Honorary Chairperson of the Potomac Chapter of Ducks Unlimited.

Dr. Lewers' involvement in these organizations resulted in his appointment to the Board of Visitors to the University of Maryland Center for Environmental and Estuarine Studies where he served for six years.

Dr. Lewers' outstanding achievements for the benefit of wildlife and the environment truly embody the spirit of the Physician Award for Community Service. His dedication and commitment to the conservation and preservation of Talbot County, the State of Maryland, and to our country certainly deserve this recognition by his peers. ■

**AMA President C. John Tupper MD Presents  
Special Award to Med Chi's  
Doctor/Lawyer/Teacher Partnership Against Drugs**

American Medical Association (AMA) President C. John Tupper MD presented Med Chi's Doctor/Lawyer/Teacher Partnership Against Drugs with a special award "in recognition and appreciation for the outstanding work done by its physician members in the Maryland Doctor/Lawyer/Teacher Partnership Against Drugs Program." During the House of Delegates session at the Med Chi Annual Meeting on May 8, 1991, Dr. Tupper commended Maryland's efforts to prevent drug abuse in our nation's children and presented Med Chi President Reynaldo L. Lee-Llacer MD with the special award. Dr. Tupper also presented an award to the Maryland Bar Association for its efforts in the program.

Through the Partnership, which is based on a model established by the AMA and the American Bar Association (ABA), doctor and lawyers visit schools in their communities to talk with students about the medical and legal consequences of drug and alcohol use. Thus far, doctor and lawyer teams have visited schools in almost every county in Maryland. To date, more than 250 classes have been visited and the program has been presented to over 8,000 students. ■

Hiroshi Nakazawa MD (r), Statewide Coordinator for the Doctor/Lawyer/Teacher Partnership Against Drugs receives a special certificate of recognition from Med Chi President Reynaldo L. Lee-Llacer MD.

## ***Physician Placement Services***

**The Medical and Chirurgical Faculty of the State of Maryland** maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

***Physician Placement Service***  
***1211 Cathedral St., Baltimore, MD 21201***  
***(301-539-0872)***

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service*. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

**MMJ** announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

### Information for Authors

Manuscripts may be sent to Editor, MMJ, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

#### Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in Word Perfect or ASCII.

Include the full name of author(s) with highest degrees, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to 20 in major

contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the **Uniform Requirements for Manuscripts Submitted to Biomedical Journals** compiled by the International Committee on Medical Journal Editors (available through the **Annals of Internal Medicine**).

**Permissions:** When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

**Copyright:** Material published in MMJ is protected by copyright and may not be reproduced without the written permission of both the principal author and MMJ.

\* \* \*

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

**RADIOLOGIST**

OVER A CENTURY AGO, a thousand visionary physicians across the nation bestowed a commemorative stone carving to the Washington Monument. This patriotic display symbolized their unrelenting devotion to a new republic founded on freedoms—including the freedom to practice medicine for the best possible health of all its people. *Today your help is needed to restore this symbol of our profession.*

Because the commemorative stone has suffered from severe erosion and defacement,

the American Medical Association is launching a campaign to raise money from physicians to restore this symbol of medicine for the National Park Service. Every contribution made to this effort will serve as a statement of each physician's personal affirmation and commitment to health and medicine in America.

Please take part in rededicating the commemorative stone as a shining example of the strength of medicine in a free and strong society. Contributors who donate \$100 or more will receive a memorial replica of the carving as a token of appreciation. Send your tax deductible contribution for this timeless symbol today. Thank you.

Yes, I want to affirm my commitment to health and medicine in America.

Please accept my contribution for:

☐ Other  
☐ \$100  
☐ \$50  
☐ \$25

Please make checks payable to:  
AMA Stone/National Park Service.  
Mail your payment with this form to:  
AMA Stone/National Park Service  
P.O. Box 109016  
Chicago, Illinois 60610-9016

Name \_\_\_\_\_

Address \_\_\_\_\_

Doctor/Lawyer/Teacher Partnership Against Drugs

Don't Smoke Yourself To Death.

# A MEDICAL TEST SHOULD NOT SCARE PEOPLE HALF TO DEATH!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS™ MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 400 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At the Accessible MRI of Baltimore County, Inc., we make it easier for you to diagnose your patients' problems.

*Magnetic Resonance Imaging without claustrophobia or noise associated with other systems*

# Quality Is Not Optional. Establishing Hospital Priorities.

*Patients in American hospitals are closely monitored. Nurses check vital signs even when a patient feels and looks fine. The reason: to verify objectively that diagnosis, treatment and follow-up have been done properly—that the patient is as healthy as he or she appears.*

*Just as carefully and just as regularly, hospitals monitor themselves. Through rigorous quality assurance programs,*

*a hospital keeps a finger on its own pulse, evaluating every aspect of its own performance. The reason: to deliver the best possible service and clinical care to every one of its patients.*

*In this article, we look at how hospitals implement these quality assurance programs and how you, the patient, benefit from them.*

## JCAHO accreditation—setting a tough standard.

Quality is not optional in America's hospitals. For institutions whose mission is preserving life and caring for the sick, there can be no margin for error. Absolute quality is absolutely essential.

Which is why hospitals have long maintained quality assurance programs setting the highest standards of service and clinical care. And why they subject themselves every three years to accreditation by the Joint Commission on Accreditation of Healthcare Organizations: JCAHO.

Independent, not-for-profit, JCAHO was established over 60 years ago by hospitals and physicians. Its mission: to verify a hospital's quality assurance process through rigorous review and evaluation of its actual performance.

A JCAHO accreditation team of a physician, an administrator and a nurse (all seasoned veterans) visits a hospital for an extensive three day inspection. They measure the hospital's actual performance against hundreds of individual standards and protocols in the 300 page JCAHO manual. Team members not only observe current practice; they review a sample of patient records for the entire three year period under scrutiny.

JCAHO accreditation is not a rubber stamp. While commendations may be given in areas of excellence, even the most prestigious institutions receive—and welcome—recommendations for change. Because the goal of both JCAHO and the hospital itself is quality patient care.

## Quality assurance—excellence every day.

While JCAHO accreditation takes place once every three years, hospitals are involved in quality assurance *every day*.

The process begins with setting standards or protocols for patient care—diagnostic techniques, treatment procedures, patient follow-up, etc. These standards reflect the wisdom and experience of the hospital's medical and professional staff, as well as current medical literature, research and JCAHO guidelines.

To ensure that patient care, in fact, reflects these standards, an effective quality assurance process mandates ongoing case review. At GBMC, for example, trained, full-time quality assurance nurses reviewed over 19,000 individual patient records during

1989. They checked each chart for more than 23 separate generic, as well as numerous specialty area, standards. Any exceptions to the generic screening process are noted and reviewed by the appropriate department's quality assurance committee.

This close review process verifies the strengths of a hospital's procedures and identifies any need for change. Along with continual monitoring of medical and technological developments, such review is the basis for ongoing updates of standards and procedures.

For patients, this never-ending cycle of quality assurance provides reassurance—an extra measure of confidence in excellent patient care.

## Quality patient care—our number one priority.

Quality assurance grows out of a hospital's philosophy that objective evaluation is essential to the hospital, its physicians and its patients. For example, the beginning of GBMC's Value Statement reads: "We will provide our patients and their families with quality health care services with sensitivity to their physical, educational and emotional needs. We recognize the trust and confidence placed in us by our patients and we act with integrity and honesty in all situations to preserve that trust and confidence." We believe that as a patient you have a "right" to receive high quality care.

Our process is thorough, meticulous and builds in objective verification of our own findings. We monitor our own performance as effectively as our nurses

monitor patients' vital signs. And our patients are the beneficiaries.

Quality is *not* optional for a hospital. As the next article in this series will explain, quality assurance also plays an important role in a hospital's selection and evaluation of its medical staff.

Establishing priorities. For a hospital, the number one priority is quality patient care.

For a reprint of this, or any other article in this series, please call 828-GBMC (4262) or write: Community Relations, 6701 North Charles Street, Baltimore, Maryland 21204.

# Why buy an office automation system that doesn't offer a long-term solution?

## ACCLAIM™ from Sentient is the total system solution.

A lot of medical practices are planning to invest in an office automation system. But a lot of the systems out there just don't offer the comprehensive functions and long-term expandability that your practice may need.

### **IBM® and compatible hardware.**

The ACCLAIM system operates on IBM and compatible hardware, so you know you're getting the quality standard of the industry. And it's completely expandable, so it can grow as your practice grows.

### **Long-term support.**

ACCLAIM is the system solution that fits your needs today. And Sentient's software engineers, customer trainers, and telephone support people

are always there to make sure your system fits your needs over the years to come.

### **Easy to operate.**

Even if your staff has no previous computer experience, ACCLAIM is simple to operate effectively and efficiently. Complete training is included in the purchase.

When you're thinking about office automation, call Sentient first, and find out what ACCLAIM can do for you.

# 4,831 Of You Have Attended Our Risk Management Seminars.

## There's Always Room For One More.

Informed consent, ICD-9-CM coding, medical record documentation, physician-patient communication, AIDS and medical practice, emerging medical technologies, financial planning, legal aspects of medical practice, insurance options, office staff procedures, health care politics in the 90's, to mention a few.

We offer an ongoing schedule of timely, relevant, and concise Risk Management programs for you and your office staff, each specifically designed around the extra skills you need in today's practice of medicine. Developed by our member physicians, the programs feature expert speakers, convenient locations, and CME credits. Some even include premium discounts.

Our seminar evaluations tell us that we're doing things right, and our attendance figures speak for themselves. We'll look forward to seeing you at an upcoming program.

There's always room for one more!

# Central Laboratories

Established 1970

*Partners for Quality Healthcare*

## **First in Quality:**

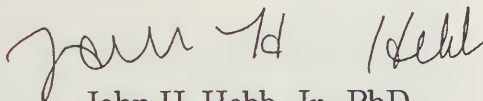

Central Laboratories is dedicated to providing outstanding service. Clients, our ultimate focus, motivate us to provide unmatched quality, reliability, consistency, and value. Our unique commitment is reflected in the exceptional level of technical proficiency, client support, and service we provide to all our customers. Quality assurance begins the minute the specimen is collected and continues throughout testing and reporting.

## **Continuous in Service:**

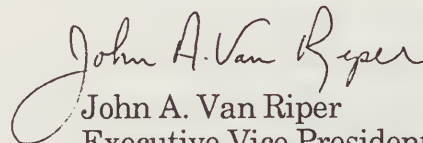

Our dedication to outstanding service compels us to provide for your individual needs. In doing so, we have expanded our operations to include **full service laboratory testing for Washington, D.C. and Suburban Maryland through our conveniently located Montgomery County Laboratory.** When it comes to **personalized laboratory testing services**, no one performs like Central Laboratories.

## **Continuous in Value:**

Our commitment to the highest quality laboratory services attainable is founded in our long tradition of service to the community. *Our innovative and progressive convictions differentiate us from our competitors and can provide for your laboratory needs today...and tomorrow.*

### ARTICLES

#### **Study of the Relationship Between Elevated Maternal Serum Alpha-fetoprotein and Adverse Pregnancy Outcome . . . . . 779**

*Amy P. Roop BA, Joann A. Boughman PhD and Miriam G. Blitzer PhD*

In a study of 1,703 pregnancies, adverse clinical outcomes associated with unexplained elevated maternal serum alpha-fetoprotein (MSAFP) included intrauterine growth retardation (IUGR), prematurity, IUGR and prematurity, prematurity without IUGR, spontaneous abortion, and stillbirth. These findings have significant implications for careful obstetrical management of patients with elevated MSAFP.

#### **Inflammatory Pseudotumor of the Retroperitoneum . . . . . 787**

*Santa J. Johnston MD, Bonnie L. Beaver MD, Chin-Chih J. Sun MD, Ruth E. Luddy MD and Allen D. Schwartz MD*

A child presenting with the findings of inflammatory disease was found to have pseudotumor of the retroperitoneum. Following surgical removal, all signs of the systemic inflammatory process resolved. These rare, benign tumors of unknown etiology must not only be differentiated from locally invasive malignant lesions, but may present with findings suggesting a chronic inflammatory disorder.

#### **Preventive Therapy for Tuberculosis in Maryland . . . . . 793**

*Evelyn Rabindran BA, Diane L. Matuszak MD, MPH, Ebenezer Israel MD, MPH, Helga Woodall CRNP, MA, Harriet Highsmith RN, BSN and James Flynn MD, MPH*

Maryland data substantiate the safety of isoniazid therapy in preventing tuberculosis. To eradicate tuberculosis in the U.S., private physicians must play an active role by offering preventive therapy to patients at high risk of developing the disease.

#### **Metastatic Basal Cell Carcinoma . . . . . 799**

*G. Thomas Grace MD and E. George Elias MD, MPH*

Metastatic basal cell carcinomas of the skin are rare tumors. Early excision of the primary lesion remains the best method of treatment, although unresectable tumors can be controlled by radiation therapy. Patients with regional lymph node metastases can be managed by radical lymph node dissection, while those with systemic metastases can be palliated by a combination of chemotherapy, radiation therapy, and surgery.

#### **Mortality Due to Septicemia in the Elderly: Factors Accounting for a Rapid Rise . . 803**

*Than Winn MBBS, MPH, Matthew Tayback ScD and Ebenezer Israel MD, MPH*

States with a high percentage of blacks, a high physician density, and a high rate of hospitalization among elderly persons are more likely to have higher rates of septicemia.

## Which Box Would You Rather Deposit Your Insurance Reimbursements In?

If you process your claims through the mail, it takes an average of two months before your reimbursements make it to the bank.

And that can really put you in a box in terms of cash flow.

But not if you join the more than 1800 physicians who are now using HCS electronic claims systems. On the average, they receive payments in days, instead of months. Reason enough to consider using our custom designed systems.

What's more, our systems are labor savers. Stacks of claims that used to take weeks to process by mail can be sent through our claims

network in a matter of hours. Saving you enormously in administrative time. Not to mention postage.

And since HCS has the backing of a billion dollar health care organization, you can depend on us for long term support, service, and solutions as your office needs change.

Call Toll-Free 1-800-543-6711 for more information. Because in rain, snow, sleet or hail, we can deliver insurance reimbursements faster.

**Health Communication Services, Inc.**

*You'll Be Overwhelmed By Your  
Cash Flow, Not Your Overhead.*

He views the world with cool detachment. Yet behind a set of drums he burns with an intensity that belies his sense of reserve. Because for Richard Leach, it's the music that makes life worth living.

A year ago, Richard was diagnosed with AIDS. And playing the drums was something he thought he would have to give up. Until his physician, Dr. Robert Z. Friedman, introduced him to Caremark Homecare.

For the past six months, Caremark has provided the antibiotics that Richard infuses every other day through a catheter implanted in his chest. Therapy that helps him fight the ravaging infections often accompanying AIDS. And lets him enjoy those things he loves most.

Like the soaring harmonies of the Moody Blues. Mose Allison's cool jazz. Or being up on stage laying down a rock-steady back beat. To Richard Leach, it's all music in the key of life.

Caremark Homecare. Because life should be worth living.<sup>SM</sup>

# JUMBO MORTGAGE CLIENTS PREFER CHASE.

**WHY?** Because Chase Professional Banking offers the flexibility, financing options, and service designed to meet the needs of the busy executive or professional.

- ☒ **Large loan amounts.** Loans for purchase or refinance from \$250,000 to \$1,000,000 or more help you maximize your buying power.
- ☒ **Competitive rates and low closing costs.** Chase does not require tax or insurance escrows, or private mortgage insurance. This can substantially reduce your initial expenses. Zero-point quotes are available.
- ☒ **Fast response.** Chase professional bankers guarantee a timely response to your loan request.
- ☒ **Exceptional service.** All mortgages remain in our portfolio, ensuring superior service over the life of the loan.

Chase Professional Banking also offers:

- A variety of high-yield deposit products.
- Unsecured lines of credit up to \$50,000.
- Luxury auto loans with terms up to 7 years.
- Marine loans up to \$250,000.

Chase Professional Banking is the choice for executives and professionals. Our resources and services are at your disposal--at your convenience.

## SELECTED COMMUNICABLE DISEASES IN MARYLAND IN 1990

### Concluded

#### MEASLES (204)

4.3/100,000 (U.S. 10.5/100,000)

The trend of measles from 1980 through 1990 is shown in Figure 10. In 1991 measles increased by 67 percent from 1989 (122 cases). Nine jurisdictions reported cases (Table 1; see July, 1991 issue). Onset of illness of 95.6% of the patients occurred in January through June; the peak month was May (59 cases).

Figure 10

Baltimore City (95 cases) had the highest (12.8) incidence rate per 100,000 population in the State, followed by Prince George's (4.8), Baltimore (4.2) and Anne Arundel (4.0) counties. Fifteen (7.4%) cases were imported from other states or from abroad.

The male to female ratio was 0.7:1.0 (1.9:1.0 among 0 to 19 years olds, and 0.4:1.0 in cases 20 years of age and older. The ratio of whites to blacks was 1.2:1.0; 5 patients were Hispanic, 2 Asian, and the race of 63 was unspecified.

The age distribution of cases by vaccine status is shown in Figure 11. The distribution by age groups was as follows: 97 (48.0%) were preschool cases, 0 to 4 years of age, 39 (19.1%) were school age children, 5 to 19, and 68 (33.3%) were adults 20 years old and over. The highest age-specific incidence rate per 100,000 (28.8) was observed among 0 to 4 years olds (30.3 in females, and

Figure 11

27.4 in males), followed by the rate in 20 to 29 (9.7) and 15 to 19 year old females (6.5). Only 6 (11.5%) of the 52 cases, between 16 months and 4 years old, were previously vaccinated (Figure 12). These preschoolers could have been protected by age-appropriate vaccination. School age children predominately had had one dose of measles vaccine and were, thus, vaccine failures. Those cases 18 and over were largely unimmunized or had unknown vaccine histories. Fifty-nine (29.4%) cases needed hospitalization (28.7% of the preschool age children, 20.0% of the school aged, and 35.3% of the adults). Of the 68 adult cases, 33 (48.5%) were health care providers.

#### MENINGITIS, VIRAL (ASEPTIC) (266)

5.6/100,000 (U.S. 4.4/100,000)

Almost three quarters (71.1%) of all cases in 1990 were reported from 4 jurisdictions: Baltimore City and County, and Montgomery and Prince George's counties. The number of cases by county is shown in Table 1 (see July, 1991 issue). The majority (78.2%) of the patients had onset of illness in June through November, the peak month was in August (52 cases).

The male to female ratio was 1.1:1.0; the sex of 2 cases was not specified. The ratio of whites to blacks was 2.6:1.0; 6 patients were Hispanic, 3 Asian, and the

race of 18 was not specified. Seventy-seven (30.0%) of the cases were less than 6 months of age, including 27 newborns. In children, 0 to 4 years of age, the incidence rate was 28.5 per 100,000 followed by the rate (7.3) in 15 to 19 years old. The highest rate in adults (6.3) was in the age group 20 to 29 years. The etiology was reported for only 7 cases: 6 enterovirus (including 1 coxsackie and 1 echovirus), and 1 H. simplex.

## MENINGOCOCCAL DISEASE (45)

**1.0/100,000 (U.S. 0.9/100,000)**

The 10 year trend of meningococcal disease is shown in Figure 12. In 1990 incidence decreased by 42.3%. Fourteen jurisdictions reported cases; Baltimore City (11 cases) and Prince George's County (9) accounted for 44.4% of all morbidity. The number of cases by county is shown in Table 1 (see July, 1991 issue). No seasonal pattern was observed; onsets of illness were distributed evenly throughout the year.

Figure 12

The male to female ratio was 1.0:1.0. The white to black ratio was 2.7:1.0; the race of 4 patients was unknown. The age ranged between 1 week and 87 years (median 3 years); 42.2% were less than 2 years of age, including 2 newborns, 40.0% were 2 to 19, and 8 (17.8%) were adults. The highest rate (6.8/100,000) was observed in 0 to 4 years olds, followed by the rate in 15 to 19 years of age (2.5/100,000).

Thirty (68.2%) patients presented with meningitis, 12 (27.3%) with meningococcemia, and 2 (4.5%) with pharyngitis; one infection was not specified. The serogroup of the N. meningitidis was reported for 13 cases, as follows: B (6), C (3) and Y (3). The outcome was known for 41 patients: 7 died, for a case fatality of 17.1 percent.

## MUMPS (1136)

**23.8/100,000 (U.S. 2.0/100,000)**

For a third consecutive year mumps continued to rise over the 6 year average of 41 cases per year between 1981 and 1987 (Figure 13). In 1990 the increase from 1989 was 81.8%. An ongoing outbreak which started among school-aged children in 1988, predominately in Prince George's County, spread in 1989 to Anne Arundel, Carroll and St. Mary's counties, and to Baltimore

Figure 13

City the following year. In 1990 Baltimore City (536 cases, for a rate of 72.8/100,000) and Prince George's County (281 cases for a rate of 38.5/100,000) reported 72.0% of all mumps in the State. Table 1 (see July, 1991 issue) shows the number of cases by county. Almost three quarters of the cases occurred during the first part of the year (peak months March, April and May). The male to female ratio was 1.2:1.0; 58.6% were black, 27.5% - white, 1.8% - other race/ethnic group, and for 12.0% race was unknown. The highest incidence rates per 100,000 population were observed among individuals 10 to 14 (130.4) and 15 to 19 (105.8) years old.

## PERTUSSIS (90)

**1.9/100,000 (U.S. 1.7/100,000)**

The 10 year trend of pertussis is shown in Figure 14. In 1990 pertussis declined by 6.3% from 1989. The reported cases were sporadic or confined to close contacts; no outbreaks were reported. The number of cases by county is shown in Table 1 (see July, 1991 issue). The highest rates per 100,000 population were observed in Dorchester (33.1) and Talbot (16.4) counties. Almost half (46.7%) of all patients had onset of cough in July, August and September.

The male to female ratio was 0.7:1.0. Ages ranged from 20 days to 67 years (median 14 months); 56.6%

Figure 14

were less than 2 years of age. The highest incidence (29 cases) occurred among infants, 1 to 5 months of age.

Thirty-one (34.4%) of the cases were laboratory confirmed: 11 (35.5%) by DFA, 9 (29.0%) by culture, and 11 (35.5%) by both DFA and culture.

The following symptoms were reported: paroxysmal cough in 78 (86.7%), post-tussive vomiting in 55 (61.1%), whoop in 42 (46.7%), cyanosis in 35 (38.9%), and apnea in 29 (32.2%). No deaths were reported.

### ANIMAL RABIES (468)

The number of animal rabies represents only the number of laboratory positive animals out of the total submitted for testing. It is likely that 3 to 9 times more wild animals die of rabies without being detected. In 1990, in Maryland, 5459 animals were examined and 468 (8.6%) were found to have rabies.

The Mid-Atlantic raccoon rabies epizootic started in 1977. The first cases in Maryland were reported by Allegany County in 1981 and by 1990 all counties, except Talbot, Dorchester, Somerset, Wicomico and Worcester, were involved in the epizootic. The cases from 1981 through 1990 are shown in Figure 15. In 1990 rabies increased by 20.8% from 1989. The cases by jurisdiction are presented in Table 1 (see July, 1991 issue). Caroline and Queen Anne's counties experienced their first cases;

Figure 15

Calvert, Charles, Garrett, Harford and Prince George's counties recorded increase of cases; St Mary's County showed no change, and the remaining counties had fewer cases from 1989. The decrease ranged from 19% (Anne Arundel County) to 66% (Baltimore City).

The epizootic has been maintained by raccoons, which accounted for 81.6% (382 cases) of all animal rabies. In addition, 35 skunks, 17 foxes, 11 cats, 3 groundhogs, 2 bovine, 2 equine, 1 dog, and 1 otter were confirmed rabid.

Rabies in bats has a distinct epidemiological cycle and is rarely transmitted to four-footed animals. The 14 rabid bats in 1990 represented a decrease from an average of 27 cases per year in the past decade.

The last two human cases of rabies in Maryland occurred in 1976 and 1945.

## ROCKY MOUNTAIN SPOTTED FEVER (20)

0.4/100,000 (U.S.0.3/100,000)

Rocky Mountain spotted fever occurred in 11 counties and Baltimore City (Table 1, see July, 1991 issue). The highest incidence (5 cases) was observed in Prince George's County. Cases were reported from April through November; peak months, each with 4 cases, were May, June and July. The male to female ratio was 1.5:1.0; the white to black ratio was 16:1 (the race of 3 patients was not known). Ages ranged from 8 to 60 years (median 29 years). Fifteen patients had rash, including 9 with rash on the palms and/or the soles, 14-fever  $\geq 100.5^{\circ}\text{F}$ , 14 - headache, and 11 - myalgia; only 5 cases presented with all of the above symptoms and signs. Nine patients were hospitalized. No deaths were reported.

Seventeen (85.0%) of the cases were confirmed: 12 with IFA tests (4-fold rise of titers or with single 1:64 titer), 4 with FA of patient's tissue and 1 with CF; 3 cases were not confirmed - the patients refused testing or were lost for follow-up. During the 14 days before onset of illness, 12 patients had had tick bite(s), 4 had visited infested areas, 1 had been in a wooded area, 1 was an owner of a dog, and 2 had no known exposure.

## SALMONELLOSIS (1251)

26.2/100,000 (U.S. Not Available)

The trend of salmonellosis in the past 15 years is presented in Figure 16. The incidence in 1990 continued to decline for a third consecutive year since 1987 (1810 cases). Cases occurred in every county (Table 1; see July, 1991 issue). Fourteen jurisdictions reported 22 outbreaks, involving 483 individuals, 155 (32.1%) of whom were laboratory confirmed and included in the total State number. Almost one quarter of all cases (22.4%) were residents of Baltimore City. The highest rates per 100,000 occurred in Talbot (72.0), Wicomico (69.9) and Caroline (59.0) counties. Thirty-eight percent (37.5%) of the patients had onset of illness in July, August or September. The male to female ratio was 0.9:1.0. The ratio of whites to blacks, among the 869 (69.5%) individuals with known race, was 1.9:1.0; 44 (3.5%) were Asian, Hispanic, or of other race. The highest incidence rate per 100,000 population (123.7) was observed among children 0 through 4 years of age.

Figure 16

Of the 665 salmonella for which serotypes were available 247 (37.1%) were *S. enteritidis*, 151 (22.7%) - *S. typhimurium*, 45 (6.8%) - *S. heidelberg*, 40 (6.0%) - *S. hadar*, 22 (3.3%) - *S. brandenburg*, 17 (2.6%) - *S. braenderup*, and 143 (21.5%) were 32 different other serotypes. Sixteen of the 22 outbreaks in 1990 were caused by *S. enteritidis*.

## SHIGELLOSIS (249)

**5.2/100,000 (U.S. Not Available)**

The number of shigellosis cases reported from 1976 through 1990 is presented in Figure 16. The number of cases by county in 1990 is shown in Table 1 (see July, 1991 issue). The highest incidence rates per 100,000 population were observed in Frederick County (15.3), Baltimore City (9.0) and Prince George's County (8.5). Sixty-nine percent of the cases occurred during the second part of the year (peak month was July with 43 cases); 4 of the 5 shigellosis outbreaks, involving 77 persons, were also reported during the same period of time.

The male to female ratio was 1.0:1.0. The white to black ratio for the cases with known race (157) was 1.3:1.0. Children less than 5 years of age accounted for 30.6% of the cases and had the highest incidence rate per 100,000 population (22.6), (19.8 in male and 25.5 in female).

The most prevalent serogroup was *S. sonnei* (81.2%), followed by *S. flexneri* (16.8%), *S. boydii* (1%) and *S. dysenteriae* (1%). All 5 reported outbreaks were caused by *S. sonnei*.

## SYPHILIS, PRIMARY AND SECONDARY (1136)

**23.8/100,00 (U.S. 19.1/100,000)**

Primary and secondary syphilis increased by 42.2% from 1989. The number of cases by county is shown in Table 1 (see July, 1991 issue). Prince George's County (638 cases, for a rate of 92.0/100,000) accounted for 56.2% of all cases (Figure 17). The highest rate in the State (109.1/100,000) occurred in Dorchester County.

The male to female ratio was 1.3 to 1.0. Eighty-five percent of all males and 87% of the females were black. The most affected age group was 25 to 29 years (24% of the male and 25% of the female cases were in this age

group), followed by males, 30 to 34 years old, and females, 20 to 24 years old.

Of 150 pregnant women with syphilis, 81 delivered babies with congenital syphilis (compared to 29 in 1989), 10 of which were stillborn. Seventy-two percent of the cases occurred in Prince George's County (58 cases).

## TUBERCULOSIS (384)

**8.0/100,000 (U.S. 9.2/100,000)**

Tuberculosis declined slightly from 1989. However, 11 counties experienced an increased incidence. The number of cases by county is shown in Table 1 (see July, 1991 issue). Wicomico County (13 cases), Baltimore City (122), and Dorchester County (5) had rates per 100,000 population (17.5, 16.6, and 16.5, respectively), double that of the State as a whole.

The ratio of whites to non-whites was 0.5:1.0. Seventeen percent (65) of the cases were less than 15 years of age.

In Montgomery County, 56 (67%) of the cases were foreign-born, primarily from Southeast Asia and Central America. In Prince George's county, 79% of the cases were non-whites and 16% were refugees. Large transient populations of migrant farm workers with high prevalence of positive skin tests in Dorchester, Somerset and Wicomico counties, might have contributed to the increased incidence.

A match of the tuberculosis and AIDS registries for 1990 identified 41 (10.7%) people with both diseases, an increase from the 26 (6.4%) in 1989. Between 1978, and 1990, 83 such cases have been identified.

A seroprevalance survey of 178 patients with tuberculosis from the counties (excluding Baltimore City), found 4 (2.2%) to be HIV positive.

Drug resistant strains of TB and increasing resistance to multiple drugs during treatment have also affected control of tuberculosis.

## TYPHOID FEVER (33)

**0.7/100,000 (U.S. 0.2/100,000)**

An outbreak of typhoid fever in Montgomery County in August 1990, accounted for the 183.3% increase in typhoid fever from 1989. Of 60 people attending a picnic, 24 became ill after eating potato salad prepared by an asymptomatic recent (3 month) emigre from Central America. *S. typhi* was isolated from the foodhandler's stool. Vi antibodies by both RIA and ELISA were high. Sixteen of the 24 patients were culture positive for *S. typhi*. Seven cases were hospitalized; 20 were treated with antibiotics. All recovered.

With the exception of one case with occupational exposure in a laboratory, the rest of the cases in Maryland (9), were all imported.

## ERRATUM

In Table 4, *Lyme Disease by County*, in the August 1991 issue, the cases and the rate per 100,000 in Calvert County should read 7 and 13.6 respectively (rather than 71 and 3.6.)

# **If There is Alzheimer's Disease...**

**Church Home** has been caring for men and women with Alzheimer's Disease since 1987 in a small and very special place we call the Broadway Wing.

The Wing is physically separate from Church Home but, like the Home, directly connected to Church Hospital. It is restful and secure. There are 22 private rooms and an enclosed garden. Nowhere in the Baltimore area is there a nursing staff better prepared—by training, experience, and temperament—for their profession.

One monthly charge covers virtually everything. There will be no hospital bills, no doctors' bills, no bills for medicines. And there is no entrance fee.

For more information or to arrange a visit to the Broadway Wing, call 732-1410.

## The Quaker and the Jew

Bart Gershen MD

The year was 1798. Napoleon Bonaparte, a Frenchman, was designing a treacherous coup d'état, while Edward Jenner, an Englishman, was about to publish an "Inquiry into the Causes and Effects of the Variolae Vaccinae." King George III sat despotically on his British throne while his former colonists in democratic America were about to pass the Alien and Sedition Acts.

On August 17th of that year, in the village of Pentonville, eight miles north of London, a child was born to a devout Quaker family; they named him Thomas. The parents, John and Elizabeth, had despaired of ever having children for their first two sons had died in infancy. But, this child was strong and active and full of enthusiasm.

Their home was filled with love and contentment. This despite the constant, oppressive prejudice that frequents people with peculiar dress or speech patterns. Thomas certainly experienced social ostracism because of his orthodox Quaker manner, but that prejudice merely served to strengthen the antithesis -- his belief in the equality of all people.

When he was twenty, Thomas wrote "An Essay on the Promotion of Civilization" in which he said "my life's aim will be to protect the primitive aboriginal people of all continents of the world to which European traders are moving." He pledged himself to ameliorate their condition, to support their cultures, and to provide them with the skills of Western civilization. He abhorred slavery and wrote with compassion about the plight of the American Indian who he believed would soon become extinct.

He helped found the British Aborigine Society dedicated to those humanitarian ends and he grew to manhood nurtured by these beliefs, confident in his own ability to right the wrongs of an arrogant, insensitive society.

Thomas was quite short and rather self-conscious, but his beliefs were sustained and passionately supported by Sarah Godlee, his attractive second cousin. The two soon fell in love, and Thomas asked for her hand -- but the elders of the church refused to permit the marriage.

The couple was devastated. There was a touching farewell, and a melancholy Thomas left Pentonville to begin a new life as physician-in-training at St. Thomas and Guy's Hospital in London.

There he walked the wards, at a tuition of ten guineas for six months. The agony of separation from Sarah drove him to submerge his feelings, to bury them in professional achievement. He came to be recognized as a bright, promising scholar and in 1820, he was recommended to the medical school at Edinburgh University. In 1821, he traveled to France and spent

the year as student to Rene Laennec at the Charité Hospital in Paris. The monaural wooden stethoscope had just been invented and Thomas quickly learned the new art of mediate auscultation.

On October 5, 1822, having returned from his sojourn, he presented a paper at Guy's Hospital on the principles of stethoscopy. His lecture was met with indifference by many, but William Stroud was so impressed that he soon developed the flexible monaural stethoscope. (One should not be too surprised at the tepid response to Laennec's creation. In the first American edition of Laennec's *Treatise on the Diseases of the Chest*, John Forbes MD prefaced the book as follows: "That it will ever come into general use notwithstanding its value, I am extremely doubtful; because its beneficial application requires much time and gives a good bit of trouble both to the patient and the practitioner... It must be confessed that there is something even ludicrous in the picture of a grave physician proudly listening through a long tube applied to the patient's thorax, as if the disease were a living being that could communicate its condition ....")

In 1828, Thomas published a short paper in the *Medical Gazette of London* entitled, "On Retroversion of the Valves of the Aorta," in which he first described a musical "purring, thrilling or sawing kind of noise" in association with retroversion of an aortic cusp. He termed it the *bruit de scie* and it is sometimes eponymously associated with his name.

Shortly thereafter, Thomas was appointed Director of Pathology at Guy's Hospital. Officially, his title was Curator of the Dead. There he spent the next fifteen years meticulously performing autopsies and cheerfully teaching on ward rounds. The students loved him, voting him unanimously as their favorite instructor.

It was about this time in his life that Thomas met an influential Jewish family. They became private patients of his and their oldest son Moses soon became his best friend. They were originally silk merchants from Spain and had emigrated with their wealth to England. Once established in London, Moses and his brother had applied for and received a seat on the illustrious London Stock Exchange. They were the first Jews approved for this prestigious position.

Soon Moses had augmented his original fortune manifold times. He married into the Rothschild family, the renowned banking moguls, and at age forty retired to devote his energy and huge resources to public and private charities. He was an Orthodox Jew and donated much of his opulence to building schools and hospitals, and founding agricultural settlements in Palestine. He was appointed Sheriff of London and, in 1837, was knighted by Queen Victoria.

Thomas, too, was accomplishing some important

goals. In 1832, *The Journal of the Medical and Chirurgical Society of London* published his paper, "Some Morbid Appearances of the Adsorbent Glands and Spleen," which received favorable critical acclaim.

And then came the catastrophic event which would end his career.

On Wednesday, the 6th of September 1837, twenty-six members of the Board of Directors of Guy's Hospital sat around a large oak table. Dr. James Chomley, Medical Director of the hospital -- officially termed Physician to Guy's Hospital -- had just died. The Board had unanimously voted for Dr. Thomas Addison to replace him. Now they had to vote on someone to fill the post of Assistant Physician to Guy's Hospital which had been vacated by Addison.

There were officially seven candidates. However, everyone connected with the hospital knew that only two names were to be considered at that meeting. One, of course, was the popular, admired and likeable Curator of the Dead -- the Quaker physician, Thomas. The second was Dr. Benjamin Babington whose sister was Richard Bright's wife, and whose father had been an admired and respected Physician to Guy's from 1795-1811.

The hospital treasurer spoke first: "I shall countenance no one at Guy's Hospital who is seen in the company of American Indians" -- a reference to Thomas and his Aborigine Society. The Board voted. Thomas received but two votes and Benjamin Babington became the new Assistant Physician.

Thomas resigned. He never again set foot in Guy's Hospital, or taught another student, or wrote another medical paper. It was the second great catastrophe of his life -- the first, of course, his inability to marry his beloved Sarah.

Moses took his friend Thomas away. They travelled many times to the European continent and to the Holy Land in pursuit of philanthropic endeavors.

In the spring of 1866, Thomas made his last journey. There had been a severe locust infestation in Palestine and the crops had been decimated. Moses and Thomas proceeded there to see if they could assist in the relief efforts for the starving population.

Thomas was not well when they left. By the time they arrived in Alexandria, Egypt, he was gravely ill and could go no further. He remained with the British Consular agent and was attended by Dr. Socci, an Egyptian physician. On April 4, 1866 at 5:15 pm, Thomas died of dysentery.

His grieving friend Moses wrote, "It has pleased the All Mighty to take him from us...one so guileless, so pious, so amiable in his private life...so respected in his public career, and so desirous to assist with all his heart in the amelioration of the condition of the Human race."

Thomas was buried in a small cemetery in Jaffa near the Tabatha Girl's School. An obelisk was erected in front of his grave by his bereaved friend Moses. It says simply:

*Here rests the body of Thomas Hodgkin MD of Bedford Square, London.*

It is now overgrown with weeds.

Hodgkin's name, of course, has been bequeathed to medical posterity for his original description of the disease which bears it. That report was based strictly on gross anatomic description of six cases examined by him at Guy's Hospital. (Microscopes were available to physicians of that era. However, they were used only to explore liquid specimens. The microtome, an instrument capable of slicing solid tissue into sections thin enough to be viewed by the microscopist, was not invented by Schwann until 1838 -- after Hodgkin had left Guy's Hospital.)

In 1926, Herbert Fox, a New York pathologist, microscopically re-examined the tissue specimens from which Hodgkin had reached his conclusions. He reported one was tuberculosis, a second syphilis, and a third was a non-Hodgkin's lymphoma. Only three of the original specimens actually represented Hodgkin's Disease.

Moses died twenty years after Hodgkin. His full name was Sir Moses Haim Montefiore. And, there exists a monument to him as well.

In the Bronx, New York.

It's called Montefiore Hospital. ■

# The President's Letter

Prepared by the President of the Medical and Chirurgical Faculty of Maryland as a service to its members

Medical  
and Chirurgical Faculty  
of Maryland

September 1991

Dear Colleague:

By now, many of you are aware of the dramatic increase in the licensure fee initiated by the Board of Physician Quality Assurance (BPQA). In the event that you fall in the A-M billing cycle, be prepared to spend \$450 next year for your two-year renewal. As your President, I feel compelled to make you aware of the manner in which this occurred and the implications of the Board's action.

In February 1991, the Executive Committee was warned by the BPQA of the distinct possibility that it would need to ask for a substantial increase in order to fulfill its charge. Not very long before, an independent evaluation of the Board's function indicated that there was not sufficient budgetary allowance to meet the rising need for physician investigation and discipline. In effect, we were being asked to pay more to be policed more efficiently.

Although we could certainly support some increase in licensure fee, I protested that the magnitude of the increase was excessive. I appealed for time to prepare our membership for any change and asked to be made aware of any occasion at which we could provide input as to the amount of the increase.

The rest, as they say, is history. Bureaucratic wheels were set in motion and the opportunity to alert our members was lost. Subsequent testimony by Med Chi and other groups was given at open hearings only after emergency authorization was given to the BPQA to raise licensure fees.

The BPQA is not Med Chi. We are distinctly different bodies linked only by Med Chi's ability to submit candidates for membership on the BPQA, subject to the final approval of the Governor. However, one vital function of the BPQA is to review and act on complaints investigated by Med Chi and its component medical societies. Med Chi's involvement is non-negotiable! Any attempt at usurping our authority will be strongly challenged.

The Board now has its emergency funding and the next few years will be critical to its survival. Med Chi looks forward to continuing its role in peer review.

Sincerely,

A handwritten signature in black ink, appearing to be "J. David Nagel".

J. David Nagel MD  
President

## 1991 Semiannual Meeting

---

Med Chi's 1991 Semiannual Meeting will be held September 13-15, 1991 at the Carousel Hotel and Resort in Ocean City. All Maryland physicians are encouraged to attend and voice their opinions during the following panel discussions:

*Radiation Technologist Standards* - Saturday, September 14, 8:30 a.m.

All physicians are encouraged to participate in this discussion which may create standards for a new class of technician called "x-ray assistant."

*Mammography Center Screenings* - Saturday, September 14, 8:30 a.m.

Physicians attending this meeting will help promulgate standards for mammography centers in Maryland. These standards will include equipment specifications, monitoring and maintenance, image quality, recordkeeping, and review of data.

*Practice Protocol for Physicians with HIV* - Saturday, September 14, 10:30 a.m.

Physicians are invited to comment on a draft protocol for physicians infected with HIV. The Maryland General Assembly charged Med Chi to develop this protocol, in consultation with the Centers for Disease Control, the Maryland Hospital Association, and the Department of Health and Mental Hygiene, and present it to the Legislature in December 1991.

AMA Trustee Robert McAfee MD will be the special guest speaker during this meeting and will address the Med Chi House of Delegates on Saturday, September 14, 1991 at 1:15 p.m. Other sessions scheduled for the meeting include sessions on Smoking Cessation, Computers, Advanced Lung Cancer, and Long-term Health Care.

A program and registration form for Med Chi's 1991 Semiannual Meeting appear on pages 816 - 817 of this MMJ.

---

## Physician Disclosure of Ownership in Health Care Services

---

Effective July 1, 1991, Maryland law requires physicians to post a notice in their office(s) regarding their ownership of health care services to which they refer patients. Med Chi encourages all physicians to tear out and display the "To My Patients" disclosure of ownership sign that follows this newsletter. A copy of the law (§ 1-206 of the Health Occupations Article of the *Annotated Code of Maryland*) appears on the reverse side of the sign. Additional signs can be obtained by calling Med Chi's Communications Department at 301-539-0872 or 1-800-492-1056.

---

## Physician Licensure Fees

---

Effective July 1, 1991, the Board of Physician Quality Assurance was granted the authority to increase physician licensure fees under an emergency regulation authorized by the Joint Committee on Administrative, Executive and Legislative Review. The emergency regulations were published in the July 12, 1991 *Maryland Register*. On July 24, 1991, Med Chi testified against the institution of the emergency regulations and against the Board's proposal to make the increase in fees a permanent change.

Med Chi expressed its concern over the magnitude of the increase, the detrimental effect of the increased fees on retired physicians, young physicians, semi-retired physicians, rural physicians, family practitioners, and out-of-state physicians. Of further concern to Med Chi was how the Board intended to use the additional funds. The Board stated that its reason for increasing the fees was to cover its operational expenses.

Despite arguments at the July 24th meeting by Med Chi and several other organizations including the Maryland Orthopaedic Society, the Maryland Hospital Association, and the Baltimore City Medical Society against increasing licensure fees, the Board voted to support the emergency regulations and to move ahead with its proposal to permanently increase the fees. The proposal to permanently increase the fees will be published in the *Maryland Register* in August or September 1991. Maryland physicians are urged to write the Board immediately and formally express their concern regarding the drastic increase in licensure fees. The address

is: Board of Physician Quality Assurance, P.O. Box 2571, Baltimore, MD 21215-0095.

The increased fees to be published in the *Maryland Register* were reported as follows:

A. Examination fees	
(1) Federation of State Medical Boards physician licensure examination, Part I .....	\$415
(2) Federation of State Medical Boards physician licensure examination, Part II .....	\$505
(3) Federation of State Medical Boards physician licensure examination, Parts I and II .....	\$770
(4) Federation of State Medical Boards physicians special purpose examination .....	\$350
B. Licensure fees	
(1) Original physician or osteopath license, American school graduate .....	\$400
(2) Original physician or osteopath license, foreign school graduate .....	\$400
(3) Foreign credentials education fee .....	\$100
(4) Physician inactive license fee .....	\$50
(5) Physician rehabilitation program fee .....	\$50
(6) Postgraduate teaching license fee .....	\$200
(7) Unlicensed medical practitioner registration fee .....	\$50
C. Renewal fees	
(1) Physician biannual license renewal .....	\$400
(2) Physician rehabilitation program fee .....	\$50
(3) Late renewal fee .....	\$50
D. Reinstatement fees	
(1) Physician reinstatement fee .....	\$450
(2) Physician rehabilitation program fee .....	\$50
F. Other fees:	
(1) Replacement of license fee .....	\$75
(2) Replacement of registration fee .....	\$25
(3) Registration of professional corporation .....	\$50
(4) Copy of grades .....	\$30

Members with questions or comments about physician licensure fees or any of the crucial medical issues facing Maryland physicians today are encouraged to become involved and contact Med Chi with your concerns.

---

## Medicaid Provider Fee Project

---

Maryland Department of Health and Mental Hygiene Secretary, Nelson Sabatini, addressed the Med Chi Council on July 18, 1991 and responded to several questions regarding the Medicaid Provider Fee Project. Mr. Sabatini has indicated that he is willing to meet with physicians and respond to questions about this project. If you are interested in such a meeting, contact Roseanne M. Matricciani, Assistant Executive Director for Health Care Policy, at 301-539-0872 or 1-800-492-1056.

## Medicare Fee Schedule

---

On June 5, 1990, the Health Care Financing Administration (HCFA) published a "Notice of Proposed Rule Making" in the *Federal Register* outlining the new Medicare fee schedule. In July and August, Med Chi sent HCFA the following letters outlining several concerns about the implications the fee schedule will have on medical care:

July 30, 1991

Gail Wilensky PhD, Administrator  
Health Care Financing Administration  
Department of Health and Human Services  
Attention: BPD-712-P  
P.O. Box 26686  
Baltimore, Maryland 21207

Dear Dr. Wilensky:

The Medical and Chirurgical Faculty of Maryland (Med Chi) represents approximately 7,000 Maryland physicians. These physicians represent general practice and specialty practices. They provide care for Medicare patients whether on an assigned or unassigned basis. However, after reviewing the Health Care Financing Administration's (HCFA) Notice of Proposed Rule Making (NPRM), which appeared in the June 5, 1991 *Federal Register*, and estimating the impact of the proposed fee schedule on their ability to practice quality medicine, many of these physicians have serious concerns that they may not be able to treat Medicare patients in the same numbers as they have in the past.

It has been the understanding of the Faculty that Medicare physician payment reform would be implemented in a fair and reasonable manner. According to legislative history, this system was not to be used as a budget cutting device. Specifically, Congress emphasized that the transition to the new payment system should be implemented on a budget

neutral basis. HCFA's proposed rules, however, threaten to negate Congressional intent and undermine the new payment system. These proposed rules are a sad testimony to the physician community which placed aside special interests and worked with Congress and HCFA to improve the Medicare payment system. Med Chi, therefore, is responding to HCFA's request for comments on the NPRM.

#### CONVERSION FACTOR

Of particular concern is the proposed *16 percent reduction in the conversion factor* (the monetary multiplier that converts relative value units into payment amounts). This reduction far exceeds the budget neutrality directive from Congress. In fact, it appears as if HCFA decided to use the new payment system merely as a budget cutting device. The assumption that physicians will automatically increase volume and intensity of services to compensate for decreased revenues is unreasonable and demeaning to physicians.

Many practicing physicians have full schedules and are too busy to increase volume merely to recoup 50 percent of potential income losses. While it is true that the Physician Payment Review Commission (PPRC) stated that "time-series studies suggest that the volume of services will respond to fee changes," PPRC further stated that "the magnitude of that response is still quite uncertain." HCFA, however, has assumed that expenditures will increase by \$.50 for every \$1 payment reduction as physicians offset payment cuts. This assumption does not have documented proof. Furthermore, HCFA admits that these volume changes could occur because of behavioral changes on the part of beneficiaries. It appears, therefore, that HCFA should be educating beneficiaries not further reducing the conversion factor. The fact, however, that HCFA has chosen to apply all of their adjustments to the conversion factor has resulted in an unfair and unreasonable proposal for implementing physician payment reform. Therefore, Med Chi urges HCFA to uphold the Congressional intention of budget neutrality by: (1) *not* applying the behavioral offset; (2) *eliminating* the tripling effect of applying *all* adjustments to the conversion factor; and (3) *not* reducing the conversion factor to correct for the transition adjustments. These drastic reductions in the conversion factor have eroded physician trust in physician payment reform being implemented in a fair and budget neutral manner. More importantly, however, very low reimbursement will adversely affect accessibility to quality care for our senior citizens.

#### GLOBAL SURGERY POLICY

With regard to HCFA's global surgery policy, a thirty-day preoperative period, which includes *all* preoperative visits by the surgeon, whether inpatient or outpatient, is not practical. Since a presumption will be made by the carrier that any visit occurring during this preoperative period is part of the global surgery package, having to justify every service delivered during that time period accentuates the **hassle factor** and *increases the cost of claims processing*. Med Chi urges that HCFA consider a seven-day preoperative period which would be more realistic and less costly.

Furthermore, evaluation by an anesthesiologist prior to surgery should not be included in the global surgery policy. Many hospitals *require* that patients who present certain risk factors *must* undergo an anesthesiology workup prior to surgery. Senior citizens usually fall into this category. This issue is a quality of care issue and should not be part of a global surgery policy.

Another very important concern is the issue of preoperative care when a patient has evidence of a previous medical history either related or non-related to the patient's primary presentation. In these circumstances, an evaluation by a family practitioner, internist, or in specialized cases, a specialist, is usually required. For example, a patient with a complicated history of cardiac disease may be admitted to the hospital for gallbladder surgery. A cardiac consultation is required to determine if the patient is stable or unstable with regard to the cardiac condition. A determination must be made about adjusting medications during this period. The surgeon performing the abdominal surgery does not ordinarily make these decisions. Therefore, Med Chi recommends that when other generalists or specialists provide expertise for diagnosing and stabilizing the patient prior to surgery, these physicians should be compensated for the services they perform.

Also, when a complex patient is admitted for surgery, it is inconceivable to think that every surgeon will be able to act as a cardiologist, infectious disease specialist, oncologist, etc., in managing the care of the patient. It is just as preposterous to assume that **medical emergencies** can be cared for by the **surgeon** as it is to assume that an **internal medicine physician** can perform the **surgery**. Med Chi, therefore, strongly recommends that co-management be compensated in cases where the patient requires the expertise of practitioners other than the surgeon.

The global surgery fee includes intraoperative services that are a "usual and necessary" part of a surgical procedure. There are many instances, however, when two separate and distinct procedures may be required and performed at the same time. Med Chi suggests that HCFA work closely with the American College of Surgeons and other specialty societies to identify intraoperative services which should be included in the global surgery package.

While all medically necessary return trips to the operating room would be billed separately and paid for, under the global surgery policy they would be reimbursed at a reduced rate (50 percent of the value of the intraoperative services originally performed). The reduced reimbursement for medically necessary surgical services does not take into consideration the complexity of the return trip to the operating room. Therefore, there should *not* be a reduced rate for re-operations for complications following surgery.

With regard to complications following surgery (e.g., stroke, heart attack, stress ulcer, etc.), complications which must be managed medically should *not* be included in the global surgery policy since separate medical diagnosis, evaluation, and treatment would be required for these complications. The regulations should specify that these "medical" complications will not be included in the global surgery package.

Although HCFA proposes a ninety-day postoperative period be included in the global fee, some surgeries may require a *longer* recuperative period for complete recovery. It is Med Chi's suggestion that HCFA work closely with the American College of Surgeons and other specialty societies to identify those surgeries requiring a longer recuperative period.

#### **GLOBAL PACKAGE - MINOR SURGERIES & SCOPIES**

Under the NPRM, if a minor surgical procedure or "scopy" is performed the same day as a visit, the visit will not be paid for unless a documented, separately identifiable service is furnished. Also, recovery from the procedure (thirty-day postoperative period) is included in the global package. Considering all of the various "scopies" and minor surgeries, it is inconceivable to think that HCFA is lumping together such procedures as colonoscopies, pancreatic cannulations, and cystoscopies. It appears that complexity and extensiveness of the procedure were not considered when this policy was formulated. Therefore, the global concept should *not* be applied to minor surgeries and "scopies." Furthermore, Med Chi disagrees with HCFA's position that a "visit" not be allowed when provided on the same day as a surgical procedure without separate documentation to substantiate the fact that the visit was separate and apart from the procedure. The physician should be allowed to bill to reflect the actual services which he/she performed.

#### **LIMITED LICENSE PRACTITIONER SERVICES**

Medicare's statutory definition of "physician" includes optometrists, dentists, oral and maxillofacial surgeons, podiatrists, and chiropractors. These "limited license practitioners" will be paid the full amount of the new Medicare *physician* payment schedule if they furnish specific services for which Medicare considers them to be physicians. Physicians and "limited license practitioners" do not have the same training, diagnostic approach, or skilled approach. Non-MD/DO providers should *not* be considered physicians (they do not practice medicine) by Medicare, and the Medicare RBRVS developed for MD/DO providers should *not* be applied to non-MD/DO providers.

#### **SITE OF SERVICE DIFFERENTIALS**

With regard to site of service differentials, HCFA proposes to reduce the practice expense relative value unit (RVU) by 50 percent when a procedure that is performed at least 50 percent of the time in an office setting is performed in an outpatient department. Unfortunately, this policy does not consider variations in practice and does not address situations where hospital-based physicians must pay for their own overhead including rental of office space, supplies, etc. Also, physicians who are unable to provide this identified care in their offices will be penalized. Therefore, Med Chi suggests that this proposal be withdrawn and the above issues be considered before setting a policy on this issue. Another comment period should be allowed before a final rule is established.

#### **PAYMENT FOR DRUGS INCIDENT TO A PHYSICIAN'S SERVICE**

HCFA has determined that payment for drugs furnished incident to a physician's service is limited to *85 percent of the national average wholesale price of the drug* as determined by HCFA. Payment for high cost or high volume drugs (as identified by HCFA) would be paid the *lower* of the estimated acquisition cost as determined by HCFA or 85 percent of the national average wholesale price for the drug. While HCFA may believe that physicians are able to obtain the same discounts as pharmacies, that presumption is a fallacy. Physicians usually do not buy medications in bulk supplies; they deal in much lower volumes than pharmacies and are *not* provided with drugs at wholesale rates. Physicians, particularly those in smaller practices, cannot afford to absorb the added cost for providing necessary medications to their Medicare patients. This proposed rule will greatly inconvenience the beneficiary and increase the cost to the beneficiary since medications will have to be purchased directly from the pharmacy and this situation will require a return trip to the physician's office for administration of the drug. Therefore, Med Chi urges HCFA *not* to implement this policy.

#### **ANESTHESIA SERVICES**

With regard to anesthesia services, HCFA is proposing to eliminate the time units and use the average time for each service and its value in the relative value guide (RVG) to develop the physician work RVUs for each anesthesia service. Because anesthesia services are unique and vary widely (case mix, surgical times, etc.), and because teaching physicians and physicians who handle a large percentage of complex cases would be severely penalized under the proposed rule, Med Chi supports the continued use of the *actual* rather than the average time.

#### **ELECTROCARDIOGRAMS**

Med Chi realizes that the statutory prohibition for payment of EKGs in conjunction with a visit or consultation restricts HCFA's options. (Med Chi opposes this statutory prohibition.) However, HCFA's proposed rule regarding EKGs goes far beyond Congressional intent. In particular, the statute prohibits separate payment for EKGs when: "payment is made under this part for a visit to a physician or consultation with a physician and, as a part of or in conjunction with the visit or consultation there is an EKG performed or ordered to be performed ...". It is apparent that the statute is referring to the situation in which the ordering physician is also the physician interpreting the EKG. HCFA's proposed rule, however, covers many more situations where no payment would be made to the physician

who interpreted the EKG even though the physician had provided services for which he/she would provide recognized RVUs.

It is unrealistic to think that EKG interpretation requires little expertise. In fact, facilities in many urban and rural areas contract with cardiologists or internists with cardiology experience to provide this special expertise to physicians less skilled in this area. Furthermore, these physicians, who must demonstrate special expertise, are granted franchises by hospitals for the interpretation of cardiology graphics. In exchange for this franchise, such physicians are responsible for supervision of the Coronary Care Unit with daily rounds and triage *without further compensation*. They are responsible for hospital clinics to provide cardiology services to *indigent* and other *non-paying* patients, again, without further compensation. These physicians also assume responsibility for the training of technical personnel, select and supervise the maintenance of equipment, and assure access to cardiology services for all patients. Once again, these services are *without further compensation*. The only compensation that these physicians do receive is that of a professional component for graphics. HCFA's proposed rule, therefore, cannot be implemented without seriously compromising Medicare patients' access to quality cardiology services. It is unrealistic to believe that surgeons, emergency room physicians, and others will pay the cardiologist for the interpretation of their EKGs. Of course, it is just as unrealistic to assume that these practitioners can always interpret their own tests. Therefore, Med Chi strongly objects as incomprehensible that this required service is not compensated when *the ordering physician is not the interpreting physician*.

#### PHYSICIANS WHO ASSIST AT SURGERY

Although the Omnibus Budget Reconciliation Act of 1990 sets a new payment methodology for assistants at surgery, Med Chi is concerned about situations in which an assistant at surgery may be required because of quality considerations. Med Chi recommends, therefore, that HCFA recognize these quality issues and the need to be flexible when setting coverage standards for assistants at surgery.

#### PAYMENT FOR SERVICES AND SUPPLIES INCIDENT TO A PHYSICIAN'S SERVICE

For certain facility-based services performed in office settings, HCFA proposes to establish a separate fee schedule allowance for certain medical supplies. While Med Chi appreciates HCFA's recognition of the importance of payment for such supplies, we suggest that HCFA work closely with specialty societies to determine the expansion of this list. Furthermore, Med Chi suggests that payment for supplies should be allowed where the physician can justify the provision of supplies beyond this list.

#### NEW PHYSICIAN ADJUSTMENT

Congress has provided for lower payment schedule amounts for new physicians in their first four years of practice. Med Chi is opposed to this provision under a resource-based payment methodology and supports the AMA in its efforts to repeal this law. However, with regard to the proposed rule, Med Chi believes that HCFA has extended the payment limitations beyond the four-year period. Therefore, Med Chi supports the recommendation by the AMA to rewrite §415.38(c) as follows: "Definition of years of practice. (1) The first year of practice is the CY ending on December 31 during which the physician, PT or OT furnishes professional services for which payment may be made under Part B."

Furthermore, Med Chi is opposed to extending the payment limitations to new physicians in group practices. Besides causing bookkeeping problems and administrative hassles, this extension has the potential of shutting young physicians out of group practices and shifting Medicare patients away from new physicians. Med Chi strongly opposes this extension of the payment limitations.

#### CONSULTATIVE PATHOLOGY SERVICES

HCFA proposes that consultative pathology services must "relate to a test result that lies outside the clinically significant normal or expected range in view of the condition of the patient." This statement makes the assumption that the requested consultative service was not beneficial to the patient and penalizes the pathologist who provided his or her expertise at the request of another physician. Therefore, Med Chi supports the AMA's recommendation that §405.556(b)(2) be reworded by adding the following language at the end: "...or that provides beneficial direction in the care of the patient;"

#### OTHER CONSIDERATIONS

Med Chi supports the comments made by the AMA concerning the conversion factor, relative value units, geographic practice cost indices, payment localities, modifiers, technical components of services and diagnostic tests, and comparability. (See Comments of the American Medical Association to the Health Care Financing Administration, July 27, 1991.)

#### CONCLUSION

Med Chi appreciates the opportunity to comment upon HCFA's proposed regulations. It is the Faculty's sincere hope that the comments submitted by the AMA, Med Chi and other state, component, and specialty societies will prove helpful to HCFA in the tremendous task of developing final regulations.

Sincerely,  
Marvin Schneider MD  
Chairman of Council

August 2, 1991

Dear Dr. Wilensky:

On July 30, 1991, I mailed you an eight-page letter citing the position of the physicians in Maryland concerning the Health Care Financing Administration's (HCFA) Notice of Proposed Rule Making. Since that time, I am continuing to hear from physicians across the State who believe that while the comments in my earlier letter were appropriate, there still exists a need to emphasize the issue of payment for electrocardiogram (EKG) interpretation.

While I previously stated that it was realistic to think that the interpretation of EKGs requires little expertise, I want to ensure the clarity with which this comment was made. Specifically, I want to stress the importance of HCFA realizing that non-payment of EKG interpretation will have an exceptionally strong and negative impact on patient care. Therefore, it is the Faculty's position, as previously stated, that it is incomprehensible that this entire EKG interpretation service is not compensated when the ordering physician is other than the interpreting physician.

Thank you for your consideration in this matter.

Sincerely,  
Marvin Schneider MD  
Chairman of Council

Med Chi intends to keep physicians apprised of new developments with the Medicare fee schedule. For questions regarding Medicare, contact Roseanne M. Matricciani, Assistant Executive Director for Health Care Policy at 301-539-0872 or 1-800-492-1056.

---

## Council Elects New Treasurer & Secretary

---

On July 18, 1991, the Med Chi Council elected a new treasurer and secretary. Albert L. Blumberg MD of Baltimore was elected Treasurer (1991-1992) and Treasurer Elect (1992-1993). Carol W. Garvey MD of Rockville was elected Secretary (1991-1992) and Secretary Elect (1992-1993). Because both officers were elected to fill vacancies in those positions, Drs. Blumberg and Garvey will assume their offices immediately.

---

## Physicians with HIV

---

During a Board of Physician Quality Assurance meeting on July 24, 1991, the Board proposed to interpret HO §14-404 to include *inter alia* that it is unprofessional conduct for a physician infected with HIV or Hepatitis B to perform invasive procedures without the written consent of the patient. Med Chi testified against this proposal stating that Med Chi is currently developing guidelines for physicians infected with HIV which will be presented to the Legislature in December 1991. Following this testimony, the Board voted to table this proposal until December after the Legislature reviews Med Chi's protocol.

---

## Med Chi Responds to Senator Helms Bill on AIDS

---

In July, following the passage of an AIDS bill in the U.S. Senate that would impose a minimum ten-year prison sentence on health care workers infected with HIV who provide treatment to patients without disclosing their HIV status, Med Chi sent letters to all U.S. Representatives and Senators from Maryland urging them to vote against such legislation. Med Chi encourages all Maryland physicians to write their congressional representatives in support of Med Chi's position on this issue. A copy of the letter sent to Maryland congresspersons is provided below for your reference. For more questions or information regarding this issue contact Betsy Newman in Med Chi's Public Relations Department at 301-539-0872 or 1-800-492-1056.

July 26, 1991

The Honorable Paul S. Sarbanes  
The United States Senate  
Washington, DC 20510

Dear Senator Sarbanes:

On behalf of the physicians of Maryland, I urge you to vote against any legislation that would: mandate testing of health care workers for the Human Immunodeficiency Virus (HIV), impose criminal penalties on HIV-infected health care workers who perform invasive procedures, or revoke the license of a health care worker who does not follow the Centers for Disease Control (CDC) guidelines.

Any attempt to pass such legislation would not be based on scientific data regarding the AIDS epidemic but would rather be a reaction to unfounded public fear. At this time, there has been no identified case of HIV transmission from physician to patient. The only case of possible HIV transmission from health care worker to patient represents a highly

speculative situation of five patients infected in a dentist's office. This constitutes an extremely improbable occurrence even under the broadest interpretation of the CDC model of transmission.

HIV is a very difficult virus to transmit. The CDC estimates that a patient's chances of becoming infected with HIV by a physician are, at most, one in 41,000 and possibly as small as one in 2.6 million. Physicians must assure their patients that transmission occurs primarily through sexual contact and IV drug use – not by visiting their physician or hospital. Physicians need to educate their patients regarding the proper precautions necessary to prevent the spread of HIV. It would be unconscionable to criminalize the delivery of medical or dental treatment by HIV-infected health care professionals, especially in cases where the disease has not been transmitted.

The Medical and Chirurgical Faculty of Maryland (Med Chi, the state medical society), in consultation with the Centers for Disease Control, the Maryland Hospital Association and the Department of Health and Mental Hygiene, is currently developing a practice protocol for physicians infected with HIV. This protocol, which is based on CDC guidelines, will be presented to the Maryland Legislature on December 2, 1991. Any action regarding HIV positive physicians should be based on scientific data contained in the CDC guidelines and not on hearsay and hysteria.

Med Chi strongly supports the CDC guidelines as the best mechanism to protect health care workers and their patients. According to the CDC, no physician or hospital worker has transmitted HIV to his or her patients, but everyday, health care workers are exposed to the virus in the patients they serve. To date, legislation has not addressed protecting the hundreds of health care workers infected every year by a needle stick or blood splatter in the line of duty.

Med Chi hopes you will consider these facts when voting on any legislation relating to HIV-infected health care workers. Med Chi believes that only through the application of sound medical principles, rather than through the criminal justice system, will society be able to confront the issues of HIV-infected health care workers rationally and compassionately and thus ensure the safety and health of all our patients.

Sincerely,  
J. David Nagel MD  
President

---

## *New Med Chi No Smoking Policy*

---

On July 18, 1991, the Council affirmed a new "No Smoking" policy within the Med Chi Faculty Buildings. The Council also adopted a "No Smoking" policy during all official events of the Faculty, irrespective of their location, e.g., during annual and semiannual meetings held in public buildings.

---

## *Drug Conference*

---

Med Chi's Second Annual Conference on Addiction and Physician Health will be held on Saturday, November 16, 1991 in the Med Chi Faculty Building. Providing seven Continuing Medical Education credits, this conference is designed to help health care professionals recognize and treat patients impaired by addiction. For program information and a registration form, see pages 808-809 of this MMJ.

---

## *Doctor/Lawyer/Teacher Partnership Against Drugs*

---

Baltimore County physicians interested in participating in the Doctor/Lawyer/Teacher Partnership Against Drugs are invited to attend one of two special training sessions at 6:00 p.m. on Tuesday, September 24 and Thursday, September 26 in the Med Chi Faculty Building. For more information about these sessions, contact Betsy Newman, Med Chi Public Relations, at 301-539-0872 or 1-800-492-1056.

---

## *President's Regional Conferences*

---

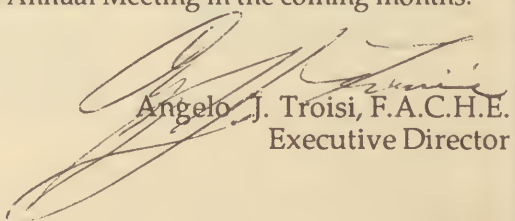

To keep the membership informed about vital medical practice issues, Med Chi has scheduled three President's Regional Conferences for 1990-1991 in western, eastern and southern Maryland. The first conference will be in western Maryland on Thursday, October 3, 1991 at the Sheraton in Hagerstown at 4:30 p.m. Med Chi will meet with physicians from the Eastern Shore on November 14, 1991 and with physicians in southern Maryland in the spring of 1992. Watch the Executive Director's Newsletter for bulletins and highlights of these conferences.

---

## *Annual Meeting at Baltimore's Omni*

---

Med Chi's Council voted on July 18, 1991 to hold Med Chi's 1992 Annual Meeting at the Omni International Hotel in Baltimore on Thursday-Saturday, April 30 - May 2, 1991. Med Chi encourages physicians to reserve these dates on their calendars. Watch for more information about the Annual Meeting in the coming months.

  
Angelo J. Troisi, F.A.C.H.E.  
Executive Director

# TO MY PATIENTS

When I refer you to a specific health care facility for medical tests or services, you may go to that facility or any other to have the tests or services completed. As you make this decision, I want you to know that I or members of my immediate family own a business interest in the following health care facilities:

---

Please feel free to ask me any questions you may have about your care. I am always interested in your continued good health.

***MARYLAND LAW REGARDING NOTICE OF OWNERSHIP  
OF OTHER HEALTH CARE SERVICES***

Effective July 1, 1991, Maryland law requires physicians to post a notice in their offices regarding their ownership of other health care services to which the physician refers patients. (see back)

The law, which is outlined in Section 1-206 of the Health Occupations Article of the Annotated Code of Maryland, states in part:

A health care practitioner may refer a patient or direct an employee of the practitioner to refer a patient to a health care service in which the practitioner, the practitioner's immediate family, or the practitioner in combination with the practitioner's immediate family owns a significant beneficial interest, if prior to the referral the practitioner:

(I) Except if an oral referral is made by telephone, provides the patient with a written statement that:

1. Discloses the existence of the ownership of the significant beneficial interest;
2. States that the patient may choose to obtain the health care service from another provider of the health care service; and
3. Requires the patient to acknowledge in writing receipt of the statement;

(II) Except if an oral referral is made by telephone, inserts in the medical record of the patient a copy of the written acknowledgement;

(III) Displays a written notice that is plainly visible to the patients of the practitioner disclosing all of the health care services:

1. In which the practitioner, the practitioner's immediate family, or the practitioner in combination with the practitioner's immediate family owns a significant beneficial interest; and
2. To which the practitioner refers patients; and

(IV) Documents in the medical record of the patient that:

1. A valid medical need exists for the referral; and
2. The practitioner has disclosed the existence of the significant beneficial interest to the patient.

# TOUGH, SMART AND YOURS

MAY 1991

**S**uccessfully defending a brain-damaged baby case is the courtroom equivalent of pitching a no-hitter. Because the "sympathy factor" can add millions to a jury's award, many insurance carriers would rather settle than fight.

Not so the P-I-E Mutual Insurance Co. of Cleveland, Ohio, and the 1-year-old law firm—Jacobson, Maynard, Tuschman & Kalur—that does all its defense work. In 21 brain-damaged baby cases, it has defended for the doctor-malpractice company, its record is a remarkable 19-1-1, the last a hung jury. In 1988, its over-all scorecard read 43 wins, 5 losses—all malpractice cases.

There's more to those numbers than luck. "Or even legal skill," adds JMT&K founding partner Aaron Jacobson, who was one of Ohio's leading plaintiff lawyers before he, Larry E. Rogers, Herbert S. Bell, M.D., and 20 other Cleveland doctors formed P-I-E in 1973.

It's the concept behind the firm that makes it work. Physician-specialty panels review every lawsuit to decide whether the defendant deviated significantly from the standard of care. If he did, we pay. If he didn't, we defend. Makes no difference whether it's a \$3,000 or a \$5 million case. We label it "No pay." That policy has resulted in a lot of cases being dropped. Perhaps more important, it's

## DON'T YOU WISH THESE DEFENSE LAWYERS WERE YOURS?

This big, multistate firm rarely loses a case. But it's more than luck, or even legal skill, that's behind its enviable record.

By Howard Eisenberg

discouraged the filing of many other cases. Plaintiffs' attorneys have learned that we're fair negotiators when our doctor's in the wrong, but won't back down when he's right."

That approach pays off. "According to the most recent report I've seen from the General Accounting Office," says Larry Rogers, P-I-E president and CEO, "in 1984, about 57 percent of medical-malpractice claims were closed without payment. Through 1988, we've closed an average of 76 percent of our cases without a dime changing hands. And it's my understanding that, without including defense costs, St. Paul Fire and Marine Insurance Co.'s 1988 average gross payout for cases closed in Ohio with payment was \$52,500. Our comparable figure was about \$10,000 below

theirs. That's partly why we can sell an ORG specialist in Ohio—an industrial state that ranks among the most litigious—\$1.2 million in coverage for just \$26,000."

The unique marriage of P-I-E and JMT&K has been so successful that the carrier has expanded into five other states: Indiana, Kentucky, Maryland, Missouri, and West Virginia. Where P-I-E goes, there goes JMT&K, with nine branch offices to date. The firm has 60 trial attorneys, and may well be the nation's largest devoted well-though exclusively to medical-malpractice defense.

Could the insurer-defender symbiosis, if duplicated by other doctor companies, make a significant contribution to reducing malpractice litigation nationwide? An up-close look at

how JMT&K operates may help to answer that question.

### Every lawyer develops a medical specialty

"Our firm's lawyers read more medical books than law books," says P-I-E Vice President Gerard C. Opienorth himself a veteran defense attorney. Robert Maynard explains, "New cases are discussed at our weekly staff meetings so that every lawyer is familiar with every case. But we assign cases to our attorneys according to medical specialty. They're well-versed in their fields, so they don't have to reinvent the wheel with each case."

Last year, the firm's ORG specialist, attorney Jerome S. Kalur, who had won 16 consecutive brain-damaged baby cases, faced one of his toughest challenges when he defended a GP

which attempted a malpractice delivery that ended in a C-section and a severely brain-injured baby. Recalls Kalur, "I didn't think the doctor had caused the damage, but our position was weakened by the fact that he didn't have malpractice privileges. Based on that departure from the standard of care, our doctor panel voted to settle, and, since the hospital was also involved, a combined sum of \$1.5 million was offered. Plaintiff turned us down flat."

"I wanted to depose the doctors who'd been involved in the mother's care during her hospitalization, but the attorney for the plaintiff baby insisted it would violate the mother's physician-patient confidentiality. That privilege would terminate automatically when her medical

The winning firm's four founders at Cleveland's 8th District Court of Appeals (from left): Jerome S. Kalur, Aaron Jacobson, James M. Tuschman, and Robert Maynard.

records were introduced at the trial end of the plaintiff's case. Meanwhile, I was in the no-win position of having to tell the jury. It couldn't have been the malpractice," without offering them another reasonable-learned-damage theory."

Fortunately, the plaintiffs rested their case on a Friday afternoon, giving JMT&K time for a weekend rally. "Twenty names later," says Kalur, "I was in the hospital pathologist's office with an order permitting me to view the mother's placental slides." Meconium staining had been charted, and Kalur had a hunch that fetal distress had begun long before the for-

# Meet the new team in town.

Maryland General Hospital of Baltimore has teamed up with Bryn Mawr Rehab of Malvern, Pennsylvania, one of the premier physical medicine and rehabilitation facilities in the country to form *Maryland General-Bryn Mawr Rehab Center*.

The new center, staffed by 50 of the finest rehab physicians, therapists, nurses and clinical specialists in the area, will offer the highest quality, comprehensive inpatient and outpatient rehabilitation services.

*Maryland General-Bryn Mawr Rehab Center* features 33 inpatient rehab beds with 15 devoted

to brain injured patients and 18 designated for orthopedic and neurological rehabilitation. Outpatient services are available at the Maryland General Campus in Baltimore and at our satellite health care centers in the neighboring communities of Catonsville and Timonium.

We invite you to meet the new team in town. Call Mary Filippelli, our Administrative Director at (301) 225-8380 to get all the details and to arrange for a tour of our new facility.

*Maryland General-Bryn Mawr Rehab Center.* When it comes to rehab care, we're strictly major league.

MARYLAND GENERAL  
BRYN MAWR REHAB CENTER

827 Linden Avenue, Baltimore, Maryland 21201 (301) 225-8380

## Drug Reps and Doctors Need Each Other

**D**rug reps have told me they have difficulty seeing about 50 percent of doctors. It seems that the more specialized the practice, the less willing is the doctor to be contacted by the drug rep. Cardiologists have a very poor record of acceptance of drug rep visits. An unwillingness to see a drug rep is not a good reputation to have.

Although some reps are better and more skilled than others, and some physicians are more capable than others, both groups are very dependent on each other. Both groups need to be aware of the problems and contributions of the other. It is the pharmaceutical industry that comes up with the new drugs we prescribe for our patients. It develops, manufactures, markets, and assumes the liability of all of the new drugs. Drug development is an enormously risky process. By the time most drugs reach the market, much of the patent protection has expired. Their profitability is soon destroyed by generic competitors who have assumed little or no risk and almost no development expense.

Another contribution of the pharmaceutical industry is its generous support of postgraduate education. Many medical meetings are completely funded by the industry. Most meetings have a token tuition which only supplements the funds contributed by the drug industry.

Advertising in medical journals is an annoyance to many physicians. Although we do not read the journals for the ads, we would have fewer journals available to read if it were not for the fact that the drug industry ads cover about 50 percent of the cost of many publications.

Some physicians are annoyed by the trips and dinners given by some of the drug companies. At times, I wonder if it is not "sour grapes" because their names were omitted from the guest lists. Perhaps if we are

more hospitable to the local drug reps, our names might appear on the next list.

It has been said with an air of holiness by some physicians that drug trips and dinners are not acceptable because the patients are paying the costs through prescription purchases. This may be true, but I believe hosting and courtesies given by the pharmaceutical industry are paltry compared to those given by the auto industry or other manufacturing and sales organizations which are paid for by the customers.

At times, the drug rep may leave a ballpoint pen, a paper weight, tote bag, or even a stethoscope as a gift for the physician. Some look with disdain on such forms of "bribery." If such small tokens alter your prescribing pattern, you can be bought more easily than you should admit is possible.

The drug reps are almost always college graduates, usually in a field allied to medicine. Most that I have talked with aspired to be physicians, but because of personal problems or lack of funds, could not complete their plans. They are first class people and are intent on helping every physician they call on to be a success in his or her practice. They are people with families, do community service, and want to be accepted by you.

Some physicians have rules such as only allowing a ten-minute visit or one visit every two to three months, or requiring a rep to make an appointment. If the drug reps are informed of this and are treated equally, I have never found one to be unhappy with the system.

Let us treat the drug reps coming to our offices with as much respect and consideration as we would our most loyal patients. See the rep as promptly and courteously as possible. We can help each other.

*DE WITTE, DE LAWTER MD*  
Bethesda

## Resource-based Relative Value Scale

When the Resource-based Relative Value Scale (RBRVS) first came onto the health policy scene, physicians supported it because it would introduce fairness and rationality into the Medicare payment system, unite the medical profession and, most of all, because it would be good for patients. But lately, many of my colleagues say they've become disillusioned with the RBRVS's implementation -- they don't trust the federal government to live up to its end of the bargain.

I don't trust the federal government to live up to its bargain, either -- at least not without concentrated pressure to do so. But I don't think the medical profession should write off the RBRVS. Despite many problems -- some immediate and some potential -- it can do what it was intended to do.

A clear benefit is that the RBRVS allows physicians to unite for a fair conversion factor and to oppose further cuts in the Medicare program, rather than engaging in internal squabbling. The conversion factor that makes the RBRVS into a real fee schedule applies to *all* physician services. That means the entire profession has a stake in making sure it's fair and an incentive to work *together* to stave off future Medicare cuts. In fact, every medical group, including the American Medical Association, the American Society of Internal Medicine, the American Academy of Family Physicians, and the American College of Surgeons, is opposing the Health Care Financing Administration's (HCFA's) proposal to lower the conversion factor. HCFA has assumed volume will increase and has set the conversion factor lower to make up for that assumed increase.

Under the RBRVS, relative values are expected to increase substantially for most evaluation and management (E/M) services. Unfortunately, the administration has set the dollar conversion factor too low to meet the requirements for budget neutrality mandated by Congress. This lowered conversion factor, if enacted, will cut Medicare expenditures by more than \$3 billion by 1986. Skeptics have suggested that the blame for lower gains for physicians under Medicare can be laid squarely at the feet of the RBRVS.

In fact, the RBRVS protects undervalued E/M services. By raising the relative values for E/M services, those services get a larger share of the Medicare dollars that will be spent on physician services -- even though the total dollars are being unacceptably reduced due to the administration's budget-driven cuts in the conversion factor.

Physicians can and should object to cuts in the conversion factor, while recognizing that all of our E/M services would have been worse off, given the proposed cuts, without the RBRVS. Medicare was right to support the RBRVS, and we are right to object to budget policies that undermine it.

It is true even with a fairer conversion factor, because of the elimination of geographic differentials and limits

on balance billing, for some there will be no actual gain (or even a reduction) for E/M services. Where physicians practice, how often they accept assignment, how much they charge in excess of Medicare's approved amount for unassigned claims, and their mix of services will determine the effect on their practices. *But regardless of each individual's gain or loss, the RBRVS will enhance payments overall for physicians' E/M services compared with what would have been the case otherwise.*

The RBRVS also provides a basis for opposing unfair cuts in specific procedures. For example, the profession can argue that the ban on reimbursement for most electrocardiogram (EKG) interpretation is contrary to the RBRVS, because the study said the service indeed has a value. The influential Physician Payment Review Commission agrees, giving the profession a real opportunity to get this cut reversed. Without the RBRVS, it would have been far more difficult to make that case.

Continued support for the RBRVS allows the profession to be for -- not just against -- something. If it weren't for the medical profession's support for the RBRVS, we'd all be worse off. No one can say that change wasn't coming. Those who don't like the RBRVS and limits on balance billing should consider the alternatives: mandatory assignment, MD-DRGs, and fees set by the government without any professional input. The RBRVS gives the profession a voice -- and it may enable us to ward off more objectionable measures.

Finally and most important, *the RBRVS is good for our patients.* It will increase the emphasis on preventive care and on evaluating and managing their treatment, and decrease the emphasis on costly high-tech services. It also will help improve access to care in underserved rural areas.

To paraphrase Mark Twain, reports of the death of the RBRVS are greatly exaggerated. But medicine can't rely on trust that everything will turn out okay. We must fight to preserve the promise of physician payment reform.

That means opposing policies that will undermine the RBRVS (such as a behavioral assumption that would lower the fee schedule conversion factor). It means working to change policies -- such as the ban on reimbursement for EKG interpretation -- that give with one hand and take away with the other. And, it means supporting further changes that will make the system even better.

The RBRVS unites physicians under one fair and rational payment system to fight future detrimental budget cuts in Medicare. Lawmakers faced with a divided house of medicine easily can use that division to cut Medicare payments even further. But, if they're faced with a profession that's united under the RBRVS, it won't be so easy.

Support for the RBRVS has been right -- for our profession and for our patients. The RBRVS will protect undervalued evaluation and management services in an era of Medicare budget-cutting, increase

access and the emphasis on preventive care for patients, and introduce fairness into the Medicare payment system. *But we must fight together -- as a profession -- to make sure it is implemented in the way Congress intended.*

President, Maryland Society of Internal Medicine

### Provider Fee Project

This letter is directed to bring your attention, and other members of the Medical Society who read this Journal, to the new Provider Fee Project proposed by the State for the state-sponsored Medicaid Program. Enclosed is a letter I have directed to Mr. Joseph Davis in regards to this project and my decision to resign from participating in the Medicaid program. The letter is self-explanatory and I would be pleased if you would publish this in the *Maryland Medical Journal*. I believe that it is imperative that the doctors organize together through their Medical Society and start protesting these bureaucratic regulations.

May 28, 1991

Mr. Joseph E. Davis, Director  
Medical Care Operations  
Baltimore, Maryland 21201

Dear Mr. Davis:

Effective immediately, I resign as a participant in the Medicaid program for the State of Maryland. I have expressed to you in the past dissatisfactions with the administrative problems of the Medicaid program as it exists in this State and its fee reimbursement policy.

But last week I received a little pink piece of paper across my desk entitled "Notice to Providers." This has broken the camel's back. The little pink piece of paper was in regards to the Provider Fee Project developed by the State and our wonderful elected officials down in Annapolis. It is nothing more than a scam, unethical, immoral, to scrape more money into your Medicaid program by false padding of the bills that the doctor submits. I cannot participate in such a program.

I spoke with Mr. Fine this morning, and believe me, I think he is a fine young man who's got a horrible job. I told him I wouldn't take it for a million dollars. He tells me that he's had numerous phone calls from other physicians, all protesting the ethics of this bill which was passed by the Legislature and signed by the Governor. It is his job to try to make us happy. He admits that it's a scam, a legal scam according to the Attorney General. I'd like to see it tested in the Supreme Court before I take the word of the Attorney General on this.

Basically, the project was developed by some smart boy somewhere reading the laws of the federal Medicaid and developed an idea where they could milk more money out of the federal government to cover the expenses of the program in the State. Mr. Fine gave me an example. Let us say that my fee for an office visit is \$50.00. In actuality it is much less. HCFA allows a 75th percentile billing to the federal program for that office visit. They bill the federal government \$40.00. They pay me \$21.00. The State takes home \$19.00 in profit which they didn't earn. If this is my only bill to the Medicaid program for the year, I am to report as income \$40.00 rather than the actual \$21.00 that I received and I am to write off an office expense as a "donation to the Provider Fee Project," \$19.00. And, the State runs scot-free with \$19.00 of federal money. I asked Mr. Fine, does he pay federal taxes as I do and he answered in the affirmative. I said, "Who is the federal government, but us? You are milking our tax dollars

to get more money into the State. This gives the federal government an excuse to increase taxation, because they've got increased expenses. Somewhere along the line, this chain letter has to break!! Since it is mandatory by law that I now bill in this manner, I cannot participate and I must resign from the program."

I will continue to examine and treat Medicaid patients. I will inform them that I no longer participate in the program and if they do have some available funds they will be expected to provide some form of payment for my services. I will adjust my fee according to the ability for them to pay. Those that are totally indigent and have no funds I will continue to treat for nothing, as I have been doing for many years.

Somewhere this stupid bureaucracy has got to stop. There has to be common sense in the program and this includes not only State projects but those sponsored by the federal government. I am sending a copy of this letter to the Honorable Paul Sarbanes. He has shown interest in our problems in the past by personal communication with me and, hopefully, he will look at this loophole in the federal law and block it.

JOSEPH F. SCHANNO MD  
Chestertown, MD

### Provider Fee Project: President's Response

Med Chi has received many inquiries regarding the Medical Assistance Program's new Provider Fee Project (PFP). On June 13, 1991, the Executive Committee met with Department of Health and Mental Hygiene (DHMH) Secretary Nelson Sabatini to voice your concerns directly.

Med Chi was assured by Mr. Sabatini that all efforts would be made to revise the billing forms so that there would be no confusion as to the accounting processes that your office uses to handle such claims and that your accountants use in calculating your tax returns.

Of equal importance are the issues regarding the legality and ethics of the program. Med Chi is prohibited from encouraging physicians to withdraw from such programs at the risk of anti-trust violations. Med Chi's obligation is to remind its membership that current Maryland law states that "physicians shall charge their customary fees to Medicaid patients." We are cognizant of the fact that there may be personal ethical issues that come to bear in your decisions. However, the current program is not in violation of the ethical policies of Med Chi.

Mr. Sabatini has agreed to go to any county medical society to discuss these issues personally. Should you have other questions regarding the PFP, please contact the Faculty directly by calling 1-800-492-1056 or 301-539-0872. The Executive Director, Angelo J. Troisi, or the Assistant Executive Director for Health Care Policy, Roseanne M. Matricciani, will be available to help you.

Once again, thank you for your input to Med Chi. Med Chi realizes that your concerns are for your patients' well-being and looks forward to helping you in this matter as well as any other matter that should arise.

J. DAVID NAGEL MD  
President, Medical and Chirurgical Faculty of Maryland

For excellent response in the treatment of  
duodenal ulcers...

**AXID**<sup>®</sup> nizatidine

has the right answers

- Rapid epigastric pain relief<sup>1,2\*</sup>
- Fast and effective ulcer healing<sup>2,3,4</sup>

**AXID**  
**PASSES THE ACID TEST**

\*Most patients experience pain relief with the first dose.  
See adjacent page for references and brief summary  
of prescribing information.

## AXID® (nizatidine capsules)

**Brief Summary. Consult the package insert for complete prescribing information.**  
**Indications and Usage:** 1. *Active duodenal ulcer*—for up to 8 weeks of treatment. Most patients heal within 4 weeks.

2. *Maintenance therapy*—for healed duodenal ulcer patients at a reduced dosage of 150 mg h.s. The consequences of therapy with Axid for longer than 1 year are not known.

**Contraindications:** Known hypersensitivity to the drug. Because cross sensitivity in this class of compounds has been observed, H<sub>2</sub>-receptor antagonists, including Axid, should not be administered to patients with a history of hypersensitivity to other H<sub>2</sub>-receptor antagonists.

**Precautions:** *General*—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency. 3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

**Laboratory Tests**—False-positive tests for urobilinogen with Multistix® may occur during therapy.

**Drug Interactions**—No interactions have been observed with theophylline, chloridiazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

**Carcinogenesis, Mutagenesis, Impairment of Fertility**—A 2-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a 2-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 50 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a 2-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

**Pregnancy—Teratogenic Effects—Pregnancy Category C**—Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect, but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in 1 fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in 1 fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

**Nursing Mothers**—Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

**Pediatric Use**—Safety and effectiveness in children have not been established.

**Use in Elderly Patients**—Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

**Adverse Reactions:** Clinical trials of varying durations included almost 5,000 patients. Among the more common adverse events in domestic placebo-controlled trials of over 1,300 nizatidine patients and over 1,300 on placebo, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common with nizatidine. It was not possible to determine whether a variety of less common events were due to the drug.

**Hepatic**—Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to 3 times the upper limit of normal, however, did not significantly differ from that in placebo patients. All abnormalities were reversible after discontinuation of Axid. Since market introduction, hepatitis and jaundice have been reported. Rare cases of cholestatic or mixed hepatocellular and cholestatic injury with jaundice have been reported with reversal of the abnormalities after discontinuation of Axid.

**Cardiovascular**—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in 2 individuals administered Axid and in 3 untreated subjects.

**CNS**—Rare cases of reversible mental confusion have been reported.

**Endocrine**—Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to nizatidine. Impotence and decreased libido were reported with equal frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

**Hematologic**—Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H<sub>2</sub>-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

**Integumental**—Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

**Hypersensitivity**—As with other H<sub>2</sub>-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

**Other**—Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

**Overdosage:** Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis does not substantially increase clearance of nizatidine due to its large volume of distribution.

# Study of the Relationship Between Elevated Maternal Serum Alpha-fetoprotein and Adverse Pregnancy Outcome

---

Amy P. Roop BA, Joann A. Boughman PhD  
and Miriam G. Blitzer PhD

---

*From the Division of Human Genetics, University of Maryland at Baltimore, where Ms. Roop is a March of Dimes Summer Research Fellow; Dr. Boughman is Professor of Obstetrics and Gynecology; and Dr. Blitzer is Assistant Professor of Pediatrics and Director of the Alpha-fetoprotein Laboratory. Reprints: Dr. Blitzer, Division of Human Genetics, University of Maryland School of Medicine, 655 W. Baltimore St., Baltimore, MD 21201.*

---

*In a study of 1,703 pregnancies, adverse clinical outcomes associated with unexplained elevated maternal serum alpha-fetoprotein (MSAFP) included intrauterine growth retardation (IUGR), prematurity, IUGR and prematurity, prematurity without IUGR, spontaneous abortion, and stillbirth. These findings have significant implications for careful obstetrical management of patients with elevated MSAFP.*

---

Maternal serum alpha-fetoprotein (MSAFP) testing has emerged as an important screening tool to identify those pregnancies at increased risk for neural tube defects (NTDs) and other fetal abnormalities.<sup>1-4</sup> Alpha-fetoprotein (AFP) is a glycoprotein synthesized by the fetus and is observed in predictable concentrations in fetal serum, amniotic fluid, and maternal serum, depending on the gestational age. AFP gains access into the amniotic fluid through fetal urination and diffuses across fetal membranes into the maternal circulation where it can be quantitated from maternal serum samples.

Previous studies have indicated an increased incidence of adverse pregnancy outcomes among women with elevated levels of MSAFP in the absence of obvious fetal malformations. Prematurity, low birthweight, intrauterine growth retardation (IUGR), fetal death in utero (FDIU), neonatal death, and fetal congenital abnormalities were among those conditions significantly associated with pregnancies in which the second trimester MSAFP level was elevated.<sup>5-17</sup>

The present study evaluates a mid-Atlantic (Maryland and some surrounding geographic catchments) prenatal population to more precisely delineate the relationship between elevated levels of MSAFP and adverse pregnancy outcome. Black women have an increased risk for specific adverse pregnancy outcomes compared to non-blacks, but the reasons (biological/genetic or sociodemographic) have not been fully assessed.<sup>6</sup> Also, it appears that younger mothers are at an increased risk for adverse outcomes compared to women over nineteen years of age.<sup>18</sup> For these reasons, the target population is evaluated with regard to specific demographic factors.

## Sampling Procedure

Maternal serum samples obtained between fifteen and twenty weeks of gestation were analyzed for AFP levels by radioim-

munoassay (Clinical Assays, Cambridge, MA). Multiple of the median (MoM) values were calculated for each sample by dividing the individual assay result by normal median values for specific gestational ages (based on greater than one-hundred values from normal pregnancies at each gestational week) and then adjusted for maternal weight and the presence or absence of insulin-dependent diabetes. Values greater than 2.3 MoM were considered elevated. By identifying gestational age discrepancies or multiple pregnancies through ultrasonography, apparent significant elevations in MSAFP were corrected. Follow-up for a true elevation in MSAFP usually included a repeat MSAFP determination, and subsequent counseling and additional testing, including detailed ultrasound examination and amniocentesis if the result remained elevated.

### Methods

From June to November of 1989, pregnancy outcome data were collected on 1,703 women who participated in the AFP testing program at the University of Maryland in 1987 and 1988. Letters were mailed to more than one hundred referring physicians asking for information regarding infant sex, gestational age at birth, birthweight, and any obstetrical or neonatal complications. However, more than 70 percent of the follow-up data were obtained directly by accessing delivery records at major medical centers. A database was established to store all pertinent maternal and pregnancy information.

Chi-square analyses were performed to assess the relationship of adverse outcome with elevated MSAFP. To compensate for multiple comparisons, the present study used a p level of 1 percent ( $p < 0.01$ ) to determine statistical significance. The frequency of certain outcomes in women with normal MSAFP and in women with elevated MSAFP was also determined. Relative risk values were calculated by dividing the frequency of an outcome in the elevated MSAFP group by its frequency in the normal MSAFP group. The resulting value represented the increased likelihood of a certain outcome given an elevated MSAFP level.

All patients were classified according to race and age, and the data analyzed with regard to race and age to address possible demographic factors that might influence the frequency of adverse outcomes. In each case, the distribution of adverse outcomes was evaluated to determine if there was increased frequency of certain adverse outcomes in blacks compared with non-blacks or in adolescent women compared with women older than nineteen. It was then possible to investigate the specific subgroups (blacks and adolescents) and assess the relationship between elevated MSAFP and certain pregnancy outcomes in these two groups.

### Results

*Statistical Analyses.* Approximately 5,000 patients were screened for MSAFP levels at the University of

Maryland in 1987-1988. Available pregnancy outcome information was analyzed in 1,703 patients whose midtrimester serum AFP levels were obtained. Excluded from this population were individuals who were lost to follow-up, and patients for whom serum samples were drawn too early or too late to be effectively interpreted. Of the total group, there were 245 patients (4.9 percent) with an initial elevated MSAFP test. Forty-four (18 percent) of these elevated MSAFP values were considered not elevated after correction for gestational age discrepancies and multiple gestations. Of the remaining 201 patients with elevated AFP levels, pregnancy outcome was obtained on 151 or approximately 75 percent. General statistics on the data set, including AFP level, race, and age, are provided in Table 1. Of the 1,703 patients, 1,382 had normal MSAFP values, 151 had an initial elevation, and 170 had low values (a patient-specific risk for a Down syndrome fetus of  $\geq 1/270$ , calculated using the patient's AFP value and age-specific risk). There were 798 black patients, 664 white patients, 27 patients were of another race, and for 214 patients, no race was given. Of the patients in the follow-up group, 54.6 percent were black. Although the mean age of the total population was 27.7, there was a high percentage of adolescent mothers aged thirteen to nineteen (16.7 percent).

The outcomes of the 1,703 pregnancies are described in Table 2. A normal outcome is defined as a pregnancy in which no adverse outcome(s) occurred. Conditions defining adverse outcomes are listed in Table 2. The frequency of total adverse outcome was calculated from pregnancies with one or more adverse outcome(s). Since more than one of the outcomes can occur in any given patient, the columns are not additive.

The distributions of specific outcomes are outlined in Table 3. IUGR and prematurity, two of the parameters analyzed in this study, were grouped in several categories to delineate specific relationships between these outcomes and elevated MSAFP levels. First,

**Table 1. General Description of the 1,703 Patients from whom Pregnancy Outcome was Obtained**

Category	% of Total Follow-Up	
	N	%

IUGR or prematurity or both of these outcomes were combined (this category was labeled prematurity and/or IUGR). Secondly, all cases of IUGR, prematurity or full-term, were evaluated. Next, all cases of prematurity, with or without IUGR, were evaluated. Lastly, prematurity without IUGR was analyzed as a distinct outcome. As expected, all cases of spina bifida, gastroschisis, and omphalocele were associated with elevated MSAFP. Significant outcomes ( $p < 0.01$ ) associated with unexplained elevated MSAFP included IUGR, prematurity (in both groups), IUGR and/or prematurity, prematurity without IUGR, spontaneous abortion, and FDIU/stillbirth. Congenital abnormalities, other than NTDs and open ventral wall defects, and neonatal death, as well as some minor outcomes, were not significantly associated with elevated MSAFP.

The frequencies of specific outcomes at increasing MSAFP levels are listed in Table 4. An obvious increase in the proportion of total adverse outcomes was correlated with the MSAFP level. Although this trend was not observed for each separate outcome, the size of some groups is small.

*Evaluation of Demographic Factors.* The distribution of adverse pregnancy outcomes by race and age is shown in Table 5. The frequency of IUGR, prematurity, IUGR and/or prematurity, prematurity without IUGR, spontaneous abortion, and FDIU/stillbirth was calculated in blacks versus whites and in adolescent mothers versus mothers older than nineteen years. A significant increase ( $p < 0.01$ ) in IUGR, extreme prematurity, prematurity, and prematurity without IUGR was observed for black women as com-

pared with white women. Prematurity without IUGR was the only outcome significantly increased in mothers age thirteen to nineteen. In both black women and younger women, an increased relative risk was observed for most of these outcomes.

The next analysis tested whether black women and young women with elevated MSAFP values had a significant increase in the incidence of given pregnancy outcomes compared to women in one of these subgroups with normal MSAFP. The distribution of adverse pregnancy outcomes in black women and in

women age thirteen to nineteen years with elevated and normal MSAFP is shown in Table 6. Of the significantly increased outcomes in black compared with white women, IUGR and IUGR with prematurity were still significantly increased in black women with elevated MSAFP. However, extreme prematurity, prematurity, and prematurity without IUGR were not significantly increased in black women with elevated MSAFP. Prematurity (< thirty-two weeks) was not significantly increased in black women as a whole or in black women with elevated MSAFP. Although spontaneous abortion and FDIU/stillbirth were not outcomes seen more frequently in black women, both were significantly increased in black women with elevated MSAFP. Prematurity without IUGR was still significantly increased ( $p < 0.01$ ) in thirteen to nineteen year olds with elevated MSAFP. Although not significant in thirteen to nineteen year olds, FDIU/stillbirth was significantly elevated in thirteen to nineteen year olds with elevated MSAFP.

## Discussion

The purpose of this study was to assess the relationship between elevated MSAFP and adverse pregnancy outcome from the patient population analyzed at the University of Maryland AFP laboratory. Comparisons with other studies must be interpreted with caution as results are dependent on the distribution of data available from follow-up which may not be representative of the general population. In support of previous findings, the distribution of certain adverse pregnancy outcomes, including IUGR, prematurity, prematurity and/or IUGR, prematurity without IUGR, spon-

\* The women in the follow-up group with low MSAFP were excluded.

MSAFP = Maternal serum alpha-fetoprotein IUGR = Intrauterine growth retardation FDIU = Fetal death in utero

taneous abortion, and FDIU/stillbirth was increased in women with elevated MSAFP when compared to women with normal MSAFP. All cases of NTDs and ventral wall defects were associated with elevated MSAFP. As in previous studies, minor adverse outcomes (complicated delivery, cesarean section, premature rupture of the membranes (PROM), and fetal distress) were not significantly increased in women with elevated MSAFP.

Low birthweight occurred in 27.8 percent of women with elevated MSAFP and in 10.3 percent of women with normal MSAFP, yielding a relative risk of 2.39 and a significant p value. These frequencies are somewhat increased over those reported by other researchers.<sup>5,6,11,14,17,19</sup> Several explanations are plausible. Differences in ascertainment of low birthweight in previous reports cause confusion when attempting to compare studies. In the present study, the analyses performed in the IUGR category more closely correlate with previous findings (a 9.9 percent incidence in women with elevated MSAFP as compared with a 2.5 percent incidence in women with normal MSAFP to yield a relative risk of 3.96). Also, other demographic factors described below may influence the higher incidence of certain outcomes in the follow-up group. The fact that all combinations of prematurity and IUGR were significantly increased in women with elevated MSAFP suggests that both IUGR and prematurity cause the increased incidence of low birthweight in infants of women with elevated MSAFP.

FDIU occurred in 6.0 percent of patients with

elevated MSAFP compared with the 4.0 percent, 7.0 percent, and 9.5 percent previously reported.<sup>7,17</sup> A 1.2 percent incidence of this outcome in women with normal MSAFP compared closely with the 0.5 percent reported by Burton.<sup>17</sup> FDIU in patients with elevated MSAFP was five times as likely to occur than in patients with normal MSAFP<sup>20</sup> (a calculated relative risk of 8).

Two outcomes previously associated with elevated MSAFP (congenital abnormalities and neonatal death) were not found to occur in a significantly higher incidence in women with elevated MSAFP in the present study, conceivably due to a small sample. Compared with Milunsky et al,<sup>20</sup> relative risks were low for congenital abnormalities (1.40) and neonatal death (1.75).

The distribution of adverse outcomes in patients with persistently elevated MSAFP was evaluated to determine if there was an increased incidence of adverse outcome in this group as compared with women with subsequent normal screens. Although adverse outcomes are not significantly increased in this population, all show a definite trend toward significance, with relative risks up to 2.07 for IUGR. Of the patients with elevated MSAFP, 51.7 percent had normal pregnancy outcomes while 32.7 percent of the women with persistent elevations in MSAFP had normal outcomes. Brock et al<sup>7</sup> calculated these incidences to be 87 percent and 54 percent, respectively. In this section of the study, 67.3 percent of women with persistent elevations in MSAFP had adverse outcomes compared with 48.3 percent in the normal population. The incidence of normal pregnancy outcomes in both groups would in-

MSAFP = Maternal serum alpha-fetoprotein IUGR = Intrauterine growth retardation FDIU = Fetal death in utero

crease if minor adverse outcomes were not included. Small sample size for this analysis could account for the fact that these results are not significant.

Previous studies have indicated an increase in adverse outcomes at increasing MSAFP levels. In the present study, total adverse outcome was increased from 53.4 percent at 2.3 to 2.99 MoM, to 56.1 percent at 3.0 to 4.99 MoM, to 90.5 percent at greater than 5.0 MoM. The only individual outcome which clearly increased with increasing MSAFP levels was FDIU (1.4 percent to 5.3 percent to 23.8 percent). Other than FDIU, there was no pattern in the incidence of adverse pregnancy outcomes at increasing MSAFP concentrations. This lack of obvious increase in adverse outcomes can be explained by small sample size. For example, there happened to be no congenital abnormalities at 3.0 to 4.99 MoM. However, there was an increase from 1.4 percent at the lower MSAFP level to 4.8 percent at the higher MSAFP level.

One explanation for the correlation between elevated MSAFP and adverse pregnancy outcome focuses on placental changes which have been postulated to account for elevations in MSAFP in pregnancies with no obvious fetal malformations and in pregnancies where the amniotic fluid AFP level is normal.<sup>21</sup> Both elevated MSAFP and adverse outcomes may have a common placental origin.<sup>14,15</sup>

In both blacks and young women, the relative risk for each outcome was increased in women with elevated MSAFP compared with women with normal MSAFP. With certain outcomes which were still significant in the black and/or adolescent group, it was evident that the underlying reason for these outcomes was the fact that the mother had elevated MSAFP. In other instances, the underlying reason for an increase in a given outcome within a subgroup was not clear because the outcome was not statistically significant when looking at women with elevated versus normal MSAFP. Thus, there must be other factors which account for the increase in high-risk pregnancies in blacks and young women. Socioeconomic status, poor health, or poor prenatal care might be factors that could account for this increase, as it has not been shown that there is a biological/genetic reason for this increase in adverse pregnancy outcomes.

The obstetrical management of patients with unexplained MSAFP elevations is controversial. However, the findings of this study may have further implications for careful obstetrical management and fetal monitoring of patients with elevated MSAFP. In the future, placental studies may provide more useful information regarding the relationship between placental abnormality and elevated MSAFP. The treatment, counseling, and management of women with unexplained elevations in MSAFP depends on future studies in this area. Obtaining follow-up pregnancy data is imperative to complete studies of this kind and requires close cooperation between referring physicians and the laboratory.

# YOCON<sup>®</sup>

## YOHIMBINE HCl

**Description:** Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

**Action:** Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

**Indications:** Yocon<sup>®</sup> is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.

**Contraindications:** Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

**Warning:** Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

**Adverse Reactions:** Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral alpha-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.<sup>1,2</sup> Also dizziness, headache, skin flushing reported when used orally.<sup>1,3</sup>

**Dosage and Administration:** Experimental dosage reported in treatment of erectile impotence.<sup>1,3,4</sup> 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.<sup>3</sup>

**How Supplied:** Oral tablets of Yocon<sup>®</sup> 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

## Maryland Metabolic Institute Announces Their New Location and Continuation of Services

**A new strategy to improve patient care**

*We help the physician  
by helping the patient  
help themselves*

**H**ealth can be maintained by teaching patients good care habits. Especially for those with needs related to:

- diabetes including gestational diabetes
- weight reduction and maintenance
- dietary problems of all types
- stress management

Now the time consuming burden of patient training can be transferred from a busy practice to a competent health care team. A certified nurse educator, master trained dietitians and behavior counselors will return the patient well educated to their primary care physician.

Training Programs Include:

#### Diabetes Education

- 20-hour courses, children and adults
- glucose monitoring
- ambulatory insulin instruction
- diabetes and pregnancy
- gestational diabetes

#### Behavior Modification

- weight reduction and maintenance
- modified fasting; Optifast
- limited diets; Optitrim
- full food control; LEARN<sup>®</sup>
- stress management

#### Dietary Counseling

- all medical disorders

Call for an appointment or further information or have patients schedule a consultation.

*“I have first-hand knowledge of the level of professionalism of Meridian’s staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents.”*

Theodore C. Patterson, M.D., Medical Director,  
Meridian Nursing Center—Heritage

#### **Partners in Healthcare**

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer’s patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at all our nursing centers. And special services like short-term or respite care, our own

pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there’s our full-time activity directors, social workers, and dietitians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

# Inflammatory Pseudotumor of the Retroperitoneum

---

Santa J. Johnston MD, Bonnie L. Beaver MD, Chin-Chih J. Sun MD,  
Ruth E. Luddy MD and Allen D. Schwartz MD

---

*From the University of Maryland Hospital where Dr. Johnston, at the time of this study, was a Resident in Pediatrics; Dr. Beaver is a Pediatric Surgeon; Dr. Sun is a Pathologist; and Dr. Luddy is a Pediatric Hematologist-Oncologist. Dr. Schwartz is Chairman, Department of Pediatrics, Sinai Hospital, Baltimore, MD. Reprints: Allen D. Schwartz MD, Dept. of Pediatrics, Sinai Hospital of Baltimore, Belvedere at Greenspring, Baltimore, MD 21215.*

---

*A child presenting with the findings of inflammatory disease was found to have a pseudotumor of the retroperitoneum. Following surgical removal, all signs of the systemic inflammatory process resolved.*

*These rare, benign tumors of unknown etiology must not only be differentiated from locally invasive malignant lesions, but may present with findings suggesting a chronic inflammatory disorder.*

---

An inflammatory pseudotumor, also known as a plasma cell tumor,<sup>1</sup> histiocytoma,<sup>2</sup> or xanthofibroma,<sup>3</sup> is a rare and often forgotten cause of a mass lesion in a child. It may also present with the signs and symptoms of a chronic inflammatory illness. Herein we report the case of a child with a pseudotumor of the retroperitoneum with extension into the spleen and posterior wall of the stomach. The major presenting findings suggested the child had a chronic inflammatory disorder. A review of the literature revealed only a few such cases reported in children.<sup>4-8</sup>

## Case Presentation

VD, a five-year-old white female, was seen by her pediatrician with an eight-week history of low grade, intermittent fevers as high as 102°F, early satiety, and a three-pound weight loss. There was no history of vomiting or change in bowel habits. The patient had a normal physical examination and was diagnosed as having a viral syndrome. Laboratory data from a community hospital revealed an elevated white blood count (WBC), erythrocyte sedimentation rate (ESR) and serum globulin level, as well as a mild, normocytic anemia. She was referred to the University of Maryland Hospital Division of Pediatric Hematology/Oncology for evaluation of her anemia. Her physical examination at the time of referral was again unremarkable. A complete blood count (CBC) revealed: hemoglobin (Hgb)=9.1 gm/dl, hematocrit (Hct)=27.6 percent, and mean corpuscular volume (MCV) of 72u<sup>3</sup>. The ESR was 31mm/hr, platelet count = 1,118,000/mm<sup>3</sup>, and WBC = 14,100/mm<sup>3</sup> with a normal differential count.

Because the child was felt to have an inflammatory process responsible for her symptoms and abnormal laboratory findings, she underwent abdominal ultrasonography and gallium scan in an effort to find the source of an occult infection. These studies revealed a left upper quadrant mass that picked up gallium. A

computed tomography (CT) scan and a magnetic resonance imaging (MRI) scan (Figure 1) delineated a 10 cm x 5 cm mass well-separated from the tail of the pancreas and kidney, as well as the spleen in the anterior plane. Radiographic studies did not delineate the mass from the posterior aspect of the fundus and body of the stomach. Despite the documentation of the presence of a large mass, it could not be appreciated on repeated physical examinations.

Laboratory studies, including extensive viral, bacterial and fungal cultures, as well as tumor markers (urinary vanillylmandelic (VMA) and homovanillic acid (HVA), carcinoembryonic antigen (CEA), and alpha-fetoprotein (AFP)), were all within normal limits. A bone marrow aspiration was unremarkable except for an increase in plasma cell numbers thought to be compatible with an inflammatory response.

The patient underwent exploratory laparotomy and excision of a retroperitoneal tumor attached to the greater curvature of the stomach and spleen. Removal of the lesion necessitated partial gastrectomy and splenorrhaphy. She had an uncomplicated postoperative course and was discharged from the hospital eight days after surgery.

The child has been followed with physical examinations, MRI, and gallium scans for over two years without tumor recurrence. Her fevers, and her elevated

ESR, white cell count, and immunoglobulin levels, as well as her anemia, have resolved.

### Pathology of the Tumor

The tumor, resected with a portion of the stomach, measured 8 x 8 x 7 cm. Its cut surface was gray-tan, and its consistency was rubbery firm. Microscopically, the tumor was composed of pleomorphic spindle cells arranged in whorls and bundles, and showed vascular proliferation and various degrees of infiltration by lymphocytes and plasma cells. The periphery of the tumor resembled granulation tissue where the spindle cells were more collagenized and the chronic inflammation and vascular proliferation were more prominent. The bulk of the tumor, however, was composed of plump spindle cells having moderate amounts of eosinophilic cytoplasm and elongated vesicular nuclei with prominent nucleoli. In some areas, the tumor was very cellular, but mitoses were rarely found. The tumor had infiltrated the external muscular layer of the stomach.

Electron microscopic examination showed two populations of spindle tumor cells, one fibroblastic and the other myofibroblastic. The fibroblasts were characterized by many parallel profiles of rough endoplasmic reticulum (Figure 2), and the myofibroblasts were fibroblasts containing bundles of actin microfilaments with interspersed dense bodies (Figure 3).

### Discussion

Inflammatory pseudotumors are an important group of benign lesions first described by Konjetzny in 1920,<sup>9</sup> and later by Vanek in 1949,<sup>10</sup> and Helwig and Ranier in 1953.<sup>11</sup> The multiple names used for these lesions have caused much confusion. They include plasma cell granuloma, mast cell tumor, fibroma, fibrous histiocytoma, postinflammatory tumor, and myofibroblastic tumor.<sup>12</sup> They are important because of the difficulty

**Figure 1.** MRI demonstrating the left upper quadrant tumor mass.

**Figure 2.** Electron microscopy of the tumor showing fibroblasts characterized by elongated nuclei and dilated rough endoplasmic reticula. (x10,000)

in differentiating them from malignant tumors prior to surgery.

Most literature on these tumors is devoted to those located in the respiratory system or orbit. The review article by Berardi et al<sup>12</sup> of 181 inflammatory pseudotumors of the lung described a patient population ranging from one through seventy-three years of age, with 8.1 percent of the patients between one and ten years of age. Scattered case reports of extrapulmonary pseudotumors indicate they have become increasingly recognized in the young patient.<sup>3,9,13-15</sup> They rarely involve the gastrointestinal tract of children.

Patients with abdominal disease usually present with a mass and a constellation of findings that may include fever, growth failure, changes in bowel habits, anemia, thrombocytosis, hyperglobulinemia, and an elevated erythrocyte sedimentation rate.<sup>6</sup> These findings are usually nonspecific and suggest a variety of disease processes, including periappendiceal abscess or inflammatory bowel disease.

In our case, the large mass could not be appreciated on physical examination by a number of experienced physicians, even after roentgenographic discovery. Ultrasound and CT scan usually reveal a nonhomogenous solid mass that may have calcifications. Surgical extirpation is necessary for definitive diagnosis.

Surgery often reveals a large, solid, non-encapsulated, well-circumscribed mass with a smooth glistening surface. It may be attached to an organ, arise from a vascular pedicle,<sup>13</sup> and sometimes infiltrate the structure of origin to a variable extent. Often it is densely adherent to surrounding organs as noted in our patient. The cut surface reveals a yellow-tan to grayish tumor with nodular fibrotic changes. There are localized proliferations of mononuclear inflammatory cells including plasma cells, lymphocytes, and eosinophils, as well as spindle-shaped mesenchymal cells of myofibroblasts.<sup>13,16</sup> A variety of other cells including

foamy histiocytes and mast cells may be present. Frequently, there are areas of myxomatous changes which have led to the subclassification of these tumors as follows:

1. *xanthogranuloma type* which have a predominantly histiocytic component;
2. *plasma cell granuloma type* which are predominantly plasma cell infiltrates; and
3. *sclerosing pseudotumors* which have mostly sclerotic features.

A single tumor may have varying amounts of all three subtypes and is named for its predominant histologic features. Pseudotumors must be differentiated from locally invasive well-differentiated fibrosarcomas, angiosarcomas, and hemangiopericytomas.<sup>8</sup> The vascular component of an inflammatory pseudotumor does not resemble the latter, but because of the large number of reactive cells, may be mistaken for an angiosarcoma.

The etiology of inflammatory pseudotumors is unknown. Some have proposed that they arise as the result of an inflammatory response following trauma, surgery, or infection. They have also been reported in association with gastric ulcer and gastric carcinoma in adults.<sup>14,17</sup> Although an infectious etiology has been postulated, bacteria, fungi, or viruses have not been cultured from these lesions.<sup>16</sup> Bahadori and Liebow have proposed that the pulmonary lesions are the result of an immunologically mediated response to an inhaled antigen.<sup>18</sup>

Treatment of choice for this tumor is surgical removal. Those reported to date have almost always been benign, but careful pathologic evaluation must be performed. In the past, the malignant appearance of these lesions has led to unnecessary radical surgery, radiation therapy, and chemotherapy. Follow-up evaluations are important because of the rare occurrence of malignant evolution that has been reported in plasma cell granulomas of the lung.<sup>19</sup> The prognosis for inflammatory pseudotumor is usually excellent and recurrence seldom occurs. Our patient has remained well for over three years following surgical removal.

# Preventive Therapy for Tuberculosis in Maryland

---

Evelyn Rabindran BA, Diane L. Matuszak MD, MPH,  
Ebenezer Israel MD, MPH, Helga Woodall CRNP, MA,  
Harriet Highsmith RN, BSN and James Flynn MD, MPH

---

*From the Maryland Department of Health and Mental Hygiene where Ms. Rabindran, at the time of the study, was a volunteer; Dr. Matuszak is Chief, Center for Community Epidemiology; Dr. Israel is Director, Epidemiology and Disease Control Program; Ms. Woodall is Chief of Tuberculosis Control; and Ms. Highsmith is a Nurse Consultant, Tuberculosis Control Division. Dr. Flynn is Director, Maryland Institute for Emergency Medical Services Systems.*

---

*Maryland data substantiate the safety of isoniazid therapy in preventing tuberculosis. To eradicate tuberculosis in the U.S., private physicians must play an active role by offering preventive therapy to patients at high risk of developing the disease.*

---

The main purpose of preventive therapy for tuberculosis is to prevent latent (asymptomatic) infection from progressing to clinical disease.<sup>1</sup> The advent of isoniazid (INH) brought the possibility of making tuberculosis a disease of the past. INH, a bactericidal drug, interferes with deoxyribonucleic acid (DNA) synthesis and intermediary metabolism of *Mycobacterium tuberculosis*, is relatively nontoxic, and is tolerated well by most patients.

Following the recognition of the increased risk of developing tuberculosis in the presence of human immunodeficiency virus (HIV) infection, the use of preventive therapy is more critical than ever. New York City, Florida, and Connecticut have reported increases in tuberculosis rates, especially in young adults, attributable to HIV infections.<sup>2,4</sup> The Advisory Committee for Elimination of Tuberculosis (ACET) recommends that health care providers test all persons with HIV infection and provide preventive therapy for those with a purified protein derivative (PPD) reaction size of 5 mm or greater.<sup>5</sup> In addition, ACET issued a consensus statement describing a plan to eradicate tuberculosis, mainly through aggressive screening, preventive therapy, and appropriate treatment regimens; the statement also highlighted the need for prevention efforts by private physicians.<sup>6</sup>

Historically, physicians have been reluctant to prescribe preventive therapy for fear of adverse reactions to INH.<sup>7</sup> Studies carried out worldwide have reassured private and public providers regarding the safety and cost effectiveness of INH preventive therapy.<sup>5</sup> Information collected in Maryland was analyzed to evaluate INH preventive therapy in public clinics, with special emphasis on compliance and adverse reactions.

## Methodology

Data from the Isoniazid Chemoprophylaxis Records for the State of Maryland (excluding Baltimore City data which are main-

tained separately) are routinely entered into a microcomputer database. The information for patients who started preventive therapy between January 1, 1988 and December 31, 1988 was analyzed. The demographics (age, sex, race, and refugee status), duration of treatment, the reasons preventive therapy was started, and the reasons preventive therapy was stopped were studied.

Duplicate records were deleted. The two reasons for duplicate records were data entry errors and patients who restarted after having quit preventive therapy earlier in the year. In the case of data entry errors, the most correct record was used in the analysis. If neither record seemed correct, one record was deleted and fields that did not match in the records were left blank so that they would not be included in the analysis. In the case of duplicate records due to patients quitting and restarting preventive therapy, the most recent record was used, with adjustments made to correct for the number of months preventive therapy was taken.

Epi Info version 5 was used to test for statistical significance. P values  $\leq 0.05$  were considered significant.

## Results

During the study period, 1,036 records were received from local health departments. As expected, the patients were relatively young: their mean age was twenty-six years (median, twenty-five years), and 809 (78 percent) of them were under age thirty-five (Table 1). Fifty-six percent (N=582) of the 1,026 patients for whom gender was indicated were male. The ratio of males to females receiving preventive therapy (1.3:1) was different from the ratio in Maryland's general population (0.9:1).

Table 1. Distribution by Age, Race, and Sex

Age Group	Asian		Black		White		Native American		Not Known	Total
	M	F	M	F	M	F	M	F		
0-14	28	20	24	28	47	31	1	1	13	193
15-34	81	72	108	62	127	122	0	1	43	616
35-55	25	23	37	23	35	28	1	0	3	175
55+	10	4	13	5	8	6	0	0	6	52
	144	119	182	118	217	187	2	2	65*	1,036

\*The sex of two Asians and three whites was unknown.

The race of 94 percent (N=977) of the total patient population was known. Whites constituted the largest proportion, 407 patients (39 percent); 300 patients (29 percent) were black; and 265 (26 percent) were Asian, 86 percent of them being refugees. Four patients were Native American, less than 1 percent of the study group. Compared to the State's population, blacks and Asians (22 percent and 1.5 percent, respectively, of Maryland's population) were overrepresented among the individuals receiving INH preventive therapy at local health departments.

**Refugees.** Ninety-nine percent of the collected records indicated whether the patient was a refugee: this categorization applies to 396 patients (38 percent) in the study group. Significantly more refugees from Asia (58 percent) than from other parts of the world received preventive therapy. The age and sex distributions of the refugee patients were not significantly different from those distributions in the total study population. The most common reason for refugee patients to start preventive therapy was a positive PPD with no other risk factors.

**Previous Preventive Therapy.** Fifty-four persons (5 percent) reported having received partial preventive therapy in the past. Almost all of them had received such therapy within the previous three years.

**Reasons for Starting and Ending Therapy.** Reasons for starting preventive therapy were available in 990 records (96 percent), and reasons for cessation of therapy were indicated in 1,019 (98 percent). Patients sixty-five years of age or older (older patients) and Asian patients were more likely to start preventive therapy because of contact with a person with tuberculosis; significantly fewer whites started therapy for this reason. Older patients and black patients were more likely to begin therapy because they were recent converters; significantly fewer refugee patients and Asian patients started therapy for recent converter status. Older patients, Asian patients, and refugees were more likely to start INH preventive therapy because of other medical conditions.

Comparison of the reasons for starting and stopping preventive therapy revealed the following (Table 2):

Table 2. Reasons for Starting and Stopping INH Preventive Therapy

		Reason Stopped								
Reason Started		Unknown	INH Adverse Reaction	Stopped by MD; No Adverse Reaction	Against Medical Advice	Completed Treatment	Lost to Follow-up	Moved with Referral	Died	Total
	Unknown	4	3	6	11	15	3	4	0	46
	Close Contact	0	1	1	10	71	2	3	0	88
	Recent Reactor	3	7	9	25	102	7	17	0	170
	Asymptomatic									
	<35 yrs of age	4	7	5	90	281	11	27	0	425
	Medical	0	0	0	1	12	0	1	0	14
	Other	6	10	10	55	175	10	26	1	293
	Total	17	28	31	192	656	33	78	1	1,036

1. Significantly more patients who had close contact with someone with tuberculosis completed treatment.
2. Significantly more patients who started therapy because they were recent converters stopped treatment on medical advice for reasons other than INH toxicity.
3. Significantly fewer patients who started therapy because they had positive PPD reactions, had no risk factors, and were under thirty-five years of age stopped treatment with medical advice but no adverse reaction.
4. Significantly more patients who started therapy because they had positive PPD reactions, no risk factors, and were younger than thirty-five stopped treatment against medical advice.
5. Female patients and black patients were more likely to stop therapy on medical advice but without adverse reaction.
6. Significantly more male patients stopped therapy because they moved and were thus lost to follow-up.

The most common reason symptomatic patients stopped INH therapy on the advice of a physician was elevation of liver enzymes. One patient died while taking INH chemoprophylaxis during the study period; the cause of death was renal cancer.

**Adverse Reactions.** Twenty-eight patients (2.7 percent) had adverse reactions to INH. Seventeen of them developed the reactions within the first two months of therapy. Older patients and black patients were more likely to stop preventive therapy due to an adverse reaction. Persons over thirty-five years of age accounted for 50 percent of the individuals with adverse reactions to INH, whereas this age group constituted only 20 percent of the study population. Significantly fewer Asian patients stopped preventive therapy because of an adverse reaction.

Unfortunately, the nature of the adverse reactions was not entered into the database. Attempts were made to locate the medical charts of the affected individuals and thus learn more about the adverse reactions. Such information was obtained for eighteen patients (Table 3). Elevated liver enzymes accounted for 50 percent of the reactions reported.

**Duration of Treatment.** Information on duration of treatment was available for 1,021 patients (99 percent).

**Table 3. Adverse Reactions to INH Among Eighteen Patients**

Reactions	No. of Patients Affected
Abnormal liver function tests	9 (one had a history of liver illness; another reported heavy drinking and seizures)
Fatigue	5 (two also reported nausea; one had fever; one had knee pain)
Vomiting and diarrhea	1
Blurred vision and personality changes	1
Dizziness	1
Stress	1

Approximately half of the patients (N=525, 51 percent) had between six and twelve months of treatment (mean, six months; median, six months).

Treatment was considered complete if the physician considered the duration of treatment to be adequate or if the patient had at least six months of INH treatment. Sixty-four percent (N=652) of the study group completed treatment. Those who completed less than the recommended six months of treatment, yet were still considered to have completed treatment, numbered 155 (23 percent). Thirty-six individuals (5 percent of the study group) received more than the recommended twelve months of treatment. No one with a PPD reaction less than 5 mm took preventive therapy longer than six months.

Medications were stopped against medical advice by 185 persons (20 percent). Significantly fewer persons who started therapy due to contact with someone with tuberculosis stopped treatment before completion compared with those who started for other reasons.

## Discussion

The key strategy for controlling tuberculosis is early identification and treatment of persons with communicable forms of the disease (sputum positive).<sup>1</sup> Many chemotherapy regimens are available to ensure complete cure of pulmonary tuberculosis. Just as important as chemical isolation and treatment of the index case is public health intervention including preventive treatment of contacts, public health education, and screening of high-risk groups.

This is the second study of isoniazid preventive therapy in Maryland. The first study, by Dash and colleagues, was published in 1980.<sup>8</sup> The two studies are not strictly comparable because, at the time of the earlier study, INH was often recommended for individuals over thirty-five years of age without risk factors. Also, the earlier study analyzed data from only fifteen local health departments, whereas the present report encompasses information from twenty-three local health departments.

Dash and colleagues reported a trend toward use of INH preventive therapy in a younger population. Fifty-five percent of their study population was younger than thirty-five. Our 1988 data show a continuation of that trend, 78 percent of the study group being under thirty-five years of age. The increasing percent of younger patients is most likely due to national and state recommendations to limit preventive therapy to persons under thirty-five years of age in the absence of risk factors, due to concern about adverse reactions. In addition, lack of resources has forced health departments to be more selective in offering preventive therapy.

In the 1980 Maryland study group,<sup>8</sup> 55 percent of the participants were female and 43 percent were male. The 1988 figures portray the reverse proportions: 43 percent of our patients are female and 56 percent are male. Reasons for the change in sex distribution are not clear.

The majority of patients in Dash's study were white

(55 percent). Whites constitute only 39 percent of patients in the current series. The decrease may be due to the increase in the number of refugees now receiving preventive therapy.

Refugees accounted for the significant increase in the number of patients on preventive therapy with a positive PPD test and no other risk factors for tuberculosis. It is important to note that blacks and older patients were more likely to start preventive therapy due to skin test conversion, suggesting transmission of tuberculosis in these populations.

One reason that patients who have had contact with someone with tuberculosis are more likely to complete preventive therapy is that they have seen the effects of the disease and do not want to experience them. It is reassuring that those at high risk of developing tuberculosis, such as close contacts and recent converters, are more likely to complete preventive therapy.

Overall, the rate of adverse reactions to INH was low (2.7 percent). Elevated liver enzymes and gastrointestinal symptoms were the most commonly observed complications of preventive therapy in this study; the only death was attributed to renal cancer, not to INH administration. The three types of side effects that have been noted with INH are as follows: (1) direct, (i.e., peripheral neuropathy and anemia); (2) allergic reactions such as skin rash, swelling of the tongue, and fever; and (3) hepatocellular toxicity which may result in hepatitis. Careful monitoring of the patient taking INH decreases the likelihood of serious complications.

The percentage of patients in this series who stopped treatment on medical advice for any reason, with or without INH side effects, is only 5.7 percent. The experience gained in the public sector through provision of medical care to socially disadvantaged populations should reassure physicians in the use of INH by persons who meet the criteria for preventive therapy. Concern about adverse reactions is not a justifiable reason for not prescribing INH preventive therapy. Given the present litigious climate, physicians may be more likely to be sued for not providing therapy to prevent tuberculosis than for side effects of the medication.

INH chemoprophylaxis is recommended for the following groups of asymptomatic people: (1) those who have been in contact with someone with tuberculosis; (2) recent converters; (3) children younger than fifteen; (4) people with a positive PPD and another risk factor; (5) individuals younger than thirty-five with a positive PPD; and (6) those with other medical reasons such as an abnormal chest x-ray film. The recommended period of INH treatment is six months to a maximum of twelve months. Since very little additional benefit is gained by providing twelve months of preventive therapy compared with six months, the shorter regimen is recommended for public clinics, except for persons with special conditions such as HIV infection or chest x-ray film findings consistent with past tuberculosis. The usual dose of INH is 10 mg/kg daily for children and 5 mg/kg daily for adults, up to a maximum dose of 300 mg per day.

Medical management of INH preventive therapy includes monitoring of possible adverse reactions. Patients should be seen on a monthly basis. The protocol recommended for public clinics requires monthly monitoring of symptoms; liver function tests are ordered only if the patient has symptoms. Baseline liver function tests are not ordered unless the patient is older than thirty-five or has a condition that may affect liver function. Pyridoxine supplements are recommended for women using oral contraceptives and for persons with the following disorders: malnutrition, seizure disorders, or chronic liver or renal disorders. Serum levels of phenytoin should be monitored in persons with seizure disorders.<sup>1</sup> Drug interactions between isoniazid and acetaminophen have been recently suggested.<sup>9</sup> The most recent recommendations for INH preventive therapy are presented in Table 4. Questions have been raised about the problem of anergy in patients with HIV infection. An immunosuppressed patient with a history of significant tuberculin reaction would be a suitable candidate for preventive therapy.<sup>10</sup>

The guidelines from the Centers for Disease Control and the American Thoracic Society recommend that all persons infected with HIV who have a negative tuberculin skin test reaction (i.e., 5 mm) and anergy may also need to be considered for isoniazid preventive therapy based on the individual's likelihood of infection with *M. tuberculosis*. For this group, preventive therapy is recommended for those who are known contacts of patients with infectious tuberculosis and those from populations in which the prevalence of tuberculosis infection exceeds 10 percent, such as intravenous drug abusers.<sup>11</sup>

**Table 4. Criteria for Determining Need for Preventive Therapy for Persons with Positive Tuberculin Reaction**

Category	Age Group (yr)	
	<35	≥35
With risk factor*	Treat all ages if reaction to 5TU PPD is ≥ 10 mm (or ≥ 5 mm and patient has had recent contact with TB, is HIV infected, or has radiographic evidence of old TB)	
No risk factor; high-incidence group <sup>+</sup>	Treat if PPD ≥ 10 mm	Do not treat
No risk factor; low-incidence group	Treat if PPD ≥ 15 mm <sup>§</sup>	Do not treat

\* Risk factors include HIV infection, recent contact with an infectious person, recent skin-test conversion, abnormal chest radiograph, intravenous drug abuse, and certain medical risk factors (see text).

<sup>+</sup> High-incidence groups include foreign-born persons, medically underserved low-income populations, and residents of long-term care facilities.

<sup>§</sup> Lower or higher cutpoints may be used for identifying positive reactions, depending on the relative prevalence of *Mycobacterium tuberculosis* infection and nonspecific cross-reactivity in the population.

Our data analysis has serious limitations. Information from Baltimore City is not included. Since blacks experience higher rates of adverse reactions to INH,<sup>5</sup> our reported incidence of adverse reactions to INH may not be accurate for the entire State.

Our database currently lacks accurate information regarding the duration of therapy: this system tends to overestimate the number of months patients collected INH because adjustments were not made for noncompliance. Even if patients collect the drug routinely, they may not ingest it regularly. It is reassuring that only 20 percent of the patients stopped preventive therapy on their own. Anecdotal reports suggest that referral mechanisms in place to assist patients when they move result in better compliance. Many of the persons certified as having completed preventive therapy in less than six months were those who had been persuaded to complete therapy following an earlier incomplete attempt or had been referred to a clinic to complete the remaining months after moving into that county. Also, individuals who have close contact with tuberculosis cases need preventive therapy for only three months if their PPD test continues to be negative.

This study illustrates the importance of periodic evaluations of data collected to ensure that appropriate information is gathered and that the data recorded are pertinent and of use to the program. It is interesting to note the changes in risk categories (HIV infection), duration of treatment, and the need for compliance with six months of preventive therapy.

Eradication of tuberculosis as a clinical entity in the United States is an ambitious undertaking. The role of private physicians in treating persons with tuberculosis and in administering INH preventive therapy is crucial to the success of such efforts.<sup>12</sup>

# MRI UPDATE

Figure 1

Figure 2

**CLINICAL HISTORY:** This is a 26-year-old male with back pain and right lower extremity radiation.

**FINDINGS:** This is an example of a normal study on a young adult. **COMMENT:** MRI is the screening test of first choice for suspected disorders of the lumbar spine. Notice the clear depiction of the normal L5-S1 disc (figure 1, crossed arrow). The discs of this patient exhibit high signal intensity reflecting normal hydration and none of the discs are narrowed. None of the discs indent the thecal sac which is of intermediate signal intensity and appears as the gray band in the center

of the image. The vertebral bodies are homogeneous and free of destructive lesions. The conus medullaris (arrow) is normal. This sagittal image demonstrates the advantages of MRI over other screening modalities. Routine CT scanning will not display the conus medullaris, lesions of which may masquerade as disc herniation. The general area of coverage is superior with MRI. Disc detail is much better displayed with MRI.

The axial image at L5-S1 (figure 2) exhibits delineation of intraspinal detail far superior to that of CT. The right S1 nerve root is clearly displayed (arrow) surrounded by normal perineural fat

which is the bright high intensity material in the periphery of the spinal canal. State-of-the-art MR images clearly display the bony anatomy of the lumbar spine including the facet joints (crossed arrow). Degenerative diseases and bony neoplasm are routinely detectable.

MRI involves no ionizing radiation and no intrathecal contrast material is needed. It is a patient-friendly outpatient examination well suited for screening purposes.

# Metastatic Basal Cell Carcinoma

---

G. Thomas Grace MD and E. George Elias MD, PhD

---

*Dr. Grace is a Plastic Surgeon in private practice in Catonsville, MD. Dr. Elias is Professor of Surgery and Oncology and Director, Surgical Oncology Program, University of Maryland, Baltimore, MD. Reprints: E. George Elias MD, University of Maryland Medical System, 22 South Greene St., Room #N13E02, Baltimore, MD 21201.*

---

*Metastatic basal cell carcinomas of the skin are rare tumors. Early excision of the primary lesion remains the best method of treatment, although unresectable tumors can be controlled by radiation therapy. Patients with regional lymph node metastases can be managed by radical lymph node dissection, while those with systemic metastases can be palliated by a combination of chemotherapy, radiation therapy, and surgery.*

---

**B**asal cell carcinoma is the most common carcinoma and constitutes 65 to 85 percent of all cutaneous cancers.<sup>1</sup> The most common location of basal cell carcinoma is the head and neck area with an 85 percent incidence.<sup>2</sup> The morbidity of basal cell carcinoma is related to recurrence, invasion, and local tissue destruction. Death from disease is rare but does occur.

Metastatic basal cell carcinomas are rare tumors with an incidence of 0.1 to 0.025 percent.<sup>3,4</sup> They are usually encountered in the head and neck region, and have a tendency for local recurrences, regional lymph node (LN) metastases, and systemic metastases mainly to the lungs and bones.<sup>5</sup> In 1951, Lattes and Kessler<sup>6</sup> firmly established the diagnostic criteria for identifying metastatic basal cell carcinoma.

We are reporting two cases of metastatic basal cell carcinoma diagnosed on our service over a fifteen-year period in a tertiary referral center. The purpose of this report is to review the natural history of this potentially lethal disease and suggest management regimens of the primary lesion, the regional LN metastases, and the systemic stage.

## Materials and Methods

*Case One* is a sixty-nine-year-old white male, retired farmer who noted a left chest wall skin lesion. This was excised in a local hospital in June 1979. The pathological examination of the specimen revealed fibrous tissue infiltrated by adenoid basal cell carcinoma with the lateral resection margin positive for tumor. He received no further treatment until about one year later when a local recurrence was noted; this was excised in the same hospital. The pathology examination revealed that the tumor was similar to that excised in 1979. He did well until late 1985 when he began to notice a fullness in his left axilla. He did not seek medical attention until August 1987 when the presence of a large tumor mass in his left axilla was confirmed. This mass measured 6 cm in diameter. The mass was excised and histological examination revealed

metastatic basal cell carcinoma in an LN identical to the primary tumor.

In October 1987, he was referred to our service. The physical exam revealed a well-developed, well-nourished white male with no palpable cervical or axillary lymph nodes. The rest of the physical examination was noncontributory except for a well-healed scar in the left axilla with no palpable lymphadenopathy. There was also a well-healed left infrascapular scar on his back from the previous excision of the primary tumor with no evidence of local recurrence. The workup included a complete blood count, urinalysis, serum chemistries including liver function tests, chest x-ray, bone scan, and computed tomography of the abdomen and the pelvis; all were within normal limits. The patient underwent a left radical axillary dissection with an uneventful postoperative recovery. The pathology revealed no residual tumor in the specimen and all twenty-one examined lymph nodes were free of tumor. The patient has been followed for over three years with no evidence of disease.

*Case Two* is a sixty-five-year-old white female who first noticed a slowly enlarging mass in the posterior aspect of her scalp in 1972. She did not seek medical attention until October 1976. At that time, her physical examination revealed two ulcerated, infected, indurated lesions with elevated margins on the posterior aspect of the scalp. The largest lesion measured 7 x 6 cm and both lesions had clinically extended to the periosteum of the skull. In addition, there was multiple bilateral posterior cervical adenopathy over the trapezius muscle. The biopsy of the primary site showed adenoid basal cell carcinoma extensively infiltrating into the subcutaneous adipose tissue and muscle. The lymph node biopsy showed metastatic basal cell carcinoma similar in characteristic to the primary. A technetium 99M bone scan showed multiple areas of increased uptake. However, the bone survey was negative and the patient was free of skeletal symptoms. In addition, the serum alkaline phosphatase and liver-spleen scan were normal.

The patient was managed initially by radiation therapy to the scalp (6,660 rad) and to the bilateral posterior cervical nodes (5,275 rad) with an excellent response. During the follow-up, the patient developed multiple local recurrences of basal cell carcinoma in the scalp, outside of the previous irradiation ports. These were treated with multiple surgical excisions and additional irradiation. In May 1978, the patient developed an enlarged upper cervical node which was excised and the histology verified as metastatic basal cell carcinoma. Therefore, she was treated with additional irradiation (6,000 rad), again with complete response.

In March 1979, the patient complained of pain in the lower part of her back and had great difficulty walking. A bone scan showed an increase in the uptake when compared to the previous bone scan, indicating progression of the disease. A bone survey showed osteolytic and osteoblastic metastases to the thoracolumbar spine and pelvis.

A bone biopsy in April 1979 confirmed the presence of metastatic basal cell carcinoma, again similar to the primary. The patient was treated by systemic chemotherapy consisting of cisplatin and bleomycin sulfate. She was well-hydrated, and then received 100 mgm per meter square of intravenous cisplatin (day one). This was followed by hydration and diuresis. On day three, the patient received 15 milligrams per meter square of bleomycin sulfate by intravenous push, followed by a continuous infusion of 15 micrograms per meter square per day for five consecutive days. This regimen was repeated once per month. There was subjective as well as objective improvement; the patient became more ambulatory, and there was a drop in the serum alkaline phosphatase level from 284 IU to 198 IU, and a considerable improvement of the bone scan. However, after three courses, such chemotherapy had to be altered because of a progressive decline in her creatinine clearance from 120 to 48 per minute which limited the administration of cisplatin. Subsequently, she was started on monthly courses of another combination chemotherapy consisting of oral cyclophosphamide (100 mg per meter square per day for fourteen days), intravenous methotrexate (30 mg per meter square on days one and eight), and intravenous 5-fluorouracil (400 mg per meter square on days one and eight). The patient continued to do well for eleven months when she showed signs of disease progression.

She was then treated with intravenous (IV) cisplatin (60 mg per meter square on day one) and IV cyclophosphamide (600 mg per meter square on day one) for two twenty-one-day courses without evidence of response. She then received one course of VP-16 -- Etoposide -- (75 mg per meter square) by continuous IV infusion for five days and failed to respond. She was then treated with two courses of IV doxorubicin hydrochloride (400 mg per meter square) every twenty-one days and again failed to respond. In May 1981, the patient underwent an internal fixation of her right femur for a pathological fracture. She died in December 1981 with progressive disease.<sup>7</sup>

## Discussion

In 1894, the first case of basal cell carcinoma was reported.<sup>8</sup> Few reports suggesting metastatic basal cell carcinoma appeared until 1951 when Lattes and Kessler established the criteria for metastatic basal cell carcinoma.<sup>6</sup> Using these criteria, twenty cases were verified.<sup>6</sup> Their criteria included:

1. the primary lesion must arise from the skin and not mucous membrane or internal organ;
2. the metastatic focus must be at site distant from the primary tumor to exclude any chance of direct spread by local invasion;
3. the primary and metastatic tumor must be histologically similar; and
4. histology of the tumor, particularly at the metastatic site, should not show features of squamous cell carcinoma.

A number of reports have followed using these criteria which have generated over 200 cases of metastatic basal cell carcinomas.<sup>9-12</sup> The true incidence of the disease remains unknown. However, two large reviews suggest an incidence of 0.1 percent to 0.025 percent.<sup>3,4</sup>

Basal cell carcinomas that metastasize usually present as large, very aggressive, ulcerating lesions that cause local tissue destruction. Generally, they are located in the head and neck area and are refractory to conservative local management. They are slow-growing tumors both at the primary and metastatic site. They also tend to recur locally, despite limited surgical excision or radiotherapy.<sup>9</sup> The nonsolid histological types (morphea and adenoid) are the most aggressive pathologic groups that infiltrate microscopically into the surrounding tissue.<sup>9,13,14</sup> The usual route of metastatic spread is to the regional lymph nodes followed by systemic metastatic foci to any parenchymatous organ, especially to the lungs and bones.<sup>5</sup>

Our first case has both normal and abnormal features of metastatic basal cell carcinoma. He is a sixty-nine-year-old caucasian male with a longtime sun exposure as a farmer. The trunk is a rare location from which a primary tumor subsequently metastasizes. The initial tumor focus was not ulcerating, but the histological type was adenoid. Evidence of microscopic infiltration was evident in a positive lateral margin, and it seems that the primary lesion extended beyond its apparent clinical boundaries. The spread to the regional axillary lymph nodes was predictable prior to systemic metastasis. It has been reported that metastases can occur five months to forty-five years (with a median interval of eleven years) after the management of the primary tumor.<sup>15</sup> In our patient, the regional metastatic focus was identified six years after the primary tumor was diagnosed.

The initial location of the basal cell carcinoma in the second case was in the head and neck area. At the time of diagnosis, the lesion was large, ulcerating, and aggressively invading the tissues up to the periosteum with regional lymph node metastases. Despite adequate initial radiotherapy, this patient had refractory disease with frequent recurrences. The initial site of metastatic spread was to the regional lymph nodes and later to the bone. She had negative chest x-rays throughout her clinical course suggesting that the lungs remained free of metastatic disease. This patient had biopsy-proven metastatic disease to the cervical lymph nodes at the time of the diagnosis, and approximately four-and-one-half years after the basal cell carcinoma was first noted by the patient. The following year, the disease had spread to the bone in the form of osteolytic and osteoblastic lesions, and this was verified by biopsy. Although this patient presents the typical natural history of the disease, she is also interesting in that she was treated with a combination of surgery, radiotherapy, and chemotherapy with frequent good response followed by recurrences for over five years from the time of diagnosis (nine-and-one-half years since onset).

The choice of management of basal cell carcinoma

remains wide surgical excision. Free margins should be the main objective. Furthermore, the pathologist should alert the surgeon that s(he) is dealing with a basal cell carcinoma belonging to the nonsolid histological groups and should remind the surgeon of their tendency to metastasize. Furthermore, if the initial excision revealed a nonsolid basal cell carcinoma of the morphea or adenoid type, the surgeon should carry a wider excision. In this select group of patients, prophylactic lymph node dissection is not justified. However, these patients demand careful long-term follow-up. Local and regional unresectable disease can be managed successfully by irradiation, as these seem to be radiosensitive.

Metastatic spread to the lymph nodes can be successfully treated by surgery.<sup>16</sup> Once the disease has spread beyond the regional lymph nodes, a cure no longer seems probable. Prognosis following metastatic disease is generally poor.<sup>15</sup> The medium time of survival after distant metastatic disease is diagnosed is ten to fourteen months. Chemotherapy and radiation therapy combined with surgery have been utilized as palliative measures to treat distant disease. Due to the rarity of these lesions, appropriate protocols have not been formulated to adequately analyze these modalities. Significant improvement in survival after evidence of distant metastatic spread may only be achieved by exploiting a multimodality approach.

# Mortality Due to Septicemia in the Elderly: Factors Accounting for a Rapid Rise

---

Than Winn MBBS, MPH, Matthew Tayback ScD  
and Ebenezer Israel MD, MPH

---

*From The Johns Hopkins University where Mr. Winn is a predoctoral student in the Division of Health Systems, and Dr. Tayback is Coordinator, the Center on Aging, Division of Geriatric Medicine. Dr. Israel is Director, Epidemiology and Disease Control Program, Maryland Department of Health and Mental Hygiene. Reprints: Dr. M. Tayback, The Johns Hopkins University School of Hygiene and Public Health, 615 N. Wolfe St., Baltimore, MD 21205.*

---

*States with a high percentage of blacks, a high physician density, and a high rate of hospitalization among elderly persons are more likely to have higher rates of septicemia.*

---

**R**ecent data published by the National Center of Health Statistics (NCHS) indicate a remarkable trend of increasing mortality due to septicemia.<sup>1</sup> A related data set indicates that Maryland has an age-adjusted rate which is among the highest in the U.S. Age-adjusted mortality due to septicemia has risen steadily since 1950 at an average rate of 6 percent annually, exceeding the average rate increase of each of the twelve leading causes of death. It is logical to believe that the major contribution to the rising trend was made by the elderly population (aged 65 and over). Manton,<sup>2</sup> Setia,<sup>3</sup> and Gross et al<sup>4</sup> have shown that the risk of dying from septicemia increases with age. In addition, examination of 1986 national data reveals an excess mortality of 40 percent when men are compared with women and an excess of 163 percent when blacks are compared with whites.

Septicemia is classified as nosocomial when it is acquired in an institutional setting and as community-acquired when it occurs at home. Morbidity statistics of septicemia are obtained from hospital discharge summaries when the condition is reported as either the principal or one of the secondary diagnoses. The diagnosis is usually based on blood culture reports or presenting clinical manifestations. Mortality statistics on the other hand are based on death certificate reports when septicemia is classified as the underlying or contributory cause of death. In 1986, septicemia was ranked thirteenth among the fifteen leading causes of death.

## Epidemiology of Septicemia Mortality

The prevalence of death due to septicemia is given full expression if one considers multiple-cause data. Septicemia as one of the multiple causes of death has been noted on death certificates at least six times more often than it has been noted as the principal or underlying cause of death (e.g., 6.6:1 in 1978<sup>5</sup> and 6.5:1 in 1979<sup>6</sup>). Consequently, only a small fraction (15 percent) of deaths as-

sociated with septicemia are represented by conventional mortality statistics.

Two estimates<sup>7,8</sup> made independently and by somewhat different methods suggest that approximately one-half of all deaths among bacteremic patients in the U.S. can be attributed directly to blood-stream infections. Wenzel,<sup>9</sup> based on the Study on Efficacy of Nosocomial Infection Control (SENIC)<sup>10</sup> and four case-control studies on nosocomial bacteremia, estimated an annual total of 24,000 deaths attributable directly to nosocomial bacteremia; this alone would place septicemia at the tenth position among leading causes of death in the U.S. since 1976.

These studies indicate that septicemia as an underlying cause of death may have been underreported. They also indicate that septicemia is a cause of significant morbidity and mortality, and contributes to a substantial economic burden related to excess length of hospital stay.

To provide insight into the means of controlling death due to septicemia, we have investigated three relevant questions:

1. Is the rising trend in the rate of mortality due to septicemia chiefly attributable to the elderly population ages 65 years and over?
2. Is there a significant variation in the age-adjusted elderly septicemia mortality rate\* among the states?
3. Can the factors be identified that account for interstate variance in mortality due to septicemia among the elderly?

## Materials and Methods

U.S. Vital Statistics Reports<sup>11</sup> for the period 1950-1987 and the NCHS Mortality Data Tape<sup>12</sup> for 1985 are major sources of information for this study. Independent variables for multiple regression analysis are based on information obtained from the American Hospital Association, the U.S. Bureau of Census, the U.S. Department of Commerce, and the Health Care Financing Administration.<sup>13-17</sup>

## Findings

*General Patterns and Trends of Septicemia Mortality Rates in the United States.* During the last three decades, the number of deaths due to septicemia in the U.S. has increased from 1,730 to 18,600.<sup>11</sup> In the wake of staphylococcal epidemics during the fifties, it is not surprising to find a 200 percent rise in mortality between 1950 and 1960. In 1959, Finland et al<sup>18</sup> reported a nearly fourfold rise in the occurrence of *Staphylococcus aureus* bacteremia and an even greater rise of gram-negative bacilleamia at the Boston City Hospital between 1935 and 1957.<sup>19</sup> After reaching a maximum

annual rate of increase in 1960, the national age-adjusted septicemia mortality rate rises steadily at a rate of 60 to 70 percent per decade. These findings favor the theory that septicemia mortality, even after controlling for the effect of age, is on the rise.

Given that the age-adjusted septicemia mortality rate is rising over time, it is pertinent to determine which demographic subgroups contribute most to this phenomenon. Although 20 percent of total septicemia deaths occurred among the elderly aged 65 and over in 1950, this proportion rose to 79 percent by 1986, a three-fold increase. (Table 1) It is instructive to note that in 1950, the highest proportion (29 percent) of total deaths due to septicemia was attributable to newborns. This proportion decreased dramatically over time; in 1986 it was less than 2 percent.

Figure 1 shows age-specific death rates due to septicemia from 1958 through 1986. Three features are noteworthy. First, the septicemia mortality rate is high among the extreme ages (namely, zero to one and sixty-five and over). Second, septicemia mortality rates among the elderly have increased over time, notably

**Table 1. Septicemia Mortality Attributable to Infants and the Elderly for Selected Calendar Years U.S. 1950-1986.**

Years	% Among Infants	% Among Elderly
1950	29.1	20.3
1960	21.0	35.6
1970	24.2	42.8
1980	2.4	72.7
1986	1.6	79.0

**Figure 1. Age-specific Mortality Due to Septicemia, United States, 1958-1986**

\* Age adjusted mortality rate for elderly septicemia has been calculated using 1980 U.S. elderly census population as the standard population.

during the last two decades. The third point worthy of note is the dramatic rise and fall of the infant septicemia mortality rate between those calendar years in which a classification switch from old-to-new International Classification of Diseases (ICD) revisions<sup>20-23</sup> took place. Because sepsis in newborns (commonly following umbilical infection) was assigned to *infection of the newborn* in ICD-7, septicemia mortality among infants was low in 1950 through 1967. From 1968 through 1978 when ICD-8 was in effect, it rose because umbilical sepsis was coded under the same rubric as septicemia. From 1979 onward, septicemia among newborns was reassigned in the ICD-9 to *conditions of the newborn*, thereby reducing infant septicemia mortality back to its original pre-ICD-8 level. These changes are artificial due to ICD revisions.

Figure 2 depicts trends of septicemia mortality rates among the elderly by four major race/sex groups. A trend analysis indicates that the septicemia mortality rate is rising by 34 percent and 40 percent per year among white elderly men and women, respectively. Among black elderly persons, the rate rose even faster, 45 percent in men and 46 percent in women. These figures suggest that race has more of an impact on septicemia mortality trends than gender.

The evidence of racial differences in septicemia mortality among the elderly is further substantiated by analysis of 1987 Maryland mortality data.<sup>24</sup> In 1987, black elderly persons died of septicemia at a death rate 100 percent greater than their white counterparts.

*State Variances in Septicemia Mortality Among the Elderly.* In 1985, 1,470,545 Americans over age sixty-five died. Of these, 13,402, or 1 percent of the deaths were

due to septicemia. As shown in Table 2, Maryland had the highest elderly septicemia mortality rate at 94.6 per 100,000, while Florida and South Dakota were the lowest with 22 per 100,000. The extremely high septicemia mortality for Maryland was confirmed by independent analysis of 1987 data provided by the Maryland State Health Department.

A simple correlation analysis employing each state as a unit of observation indicates that the age-adjusted septicemia mortality rate among the elderly is significantly associated with the proportion of blacks in the community ( $r = 0.49, p < 0.01$ ), physician density ( $r = 0.36, p < 0.05$ ), and nurse density ( $r = 0.31, p < 0.05$ ). Of interest is the finding that the rate also varies positively with the hospital discharge rate of elderly patients ( $r = 0.2, p = 0.16$ ). Simple correlation ratios with other variables are not significant. Among the potential determining factors, one finds a significant intercorrelation. Physician concentration, for instance, is highly correlated with urbanization ( $r = 0.70$ ) and with median per capita income ( $r = 0.66$ ). Nurse concentration is highly associated with bed occupancy ( $r = 0.78$ ).

When the principal factors are considered jointly, by multiple regression analysis, the percentage of blacks in the population turns out to be the most significant variable accounting for state variance in mortality due to septicemia among the elderly. A total of 46 percent of the variance among states is accounted for by seven independent variables. The percentage of blacks in the population has a significant regression coefficient (b-value) of 0.8 ( $p = 0.001$ ). This implies that for every one percent increase in the proportion of blacks in the population, there would be approximately one additional elderly septicemia death per 100,000 population, controlling for all other independent variables. The multiple regression ratio specific for race suggests that 25 percent of the state variance in the age-adjusted elderly septicemia mortality rate is accounted for by the percentage of blacks in the population.

When a stepwise multiple regression procedure was performed, three independent variables (percentage of blacks, physician density, and discharge rate) turned out to be the most significant variables. These three variables jointly explain 40 percent of the age-adjusted elderly septicemia mortality rate variation while the

Figure 2. Elderly Septicemia Mortality Rate by Race and Sex United States, 1958-1986

Table 2. Age-Adjusted Mortality Rate Due to Septicemia Among the Elderly, U.S. 1985.

	Top Five States	Deaths Per 100,000
1	Maryland	94.64
2	Louisiana	79.25
3	New Jersey	74.47
4	Pennsylvania	72.57
5	Delaware	71.09
	Lowest Five States	
1	South Dakota	22.02
2	Florida	22.81
3	California	22.96
4	Oregon	24.03
5	Montana	26.87

four other variables combined (nurse density, hospital bed occupancy by the elderly, urbanization, and income per capita) account for just 6 percent of the age-adjusted elderly septicemia mortality rate variation.

The effect of race on septicemia mortality was further investigated by analyzing the 1987 Maryland septicemia mortality data.<sup>24</sup> The crude relative risk of elderly blacks dying from septicemia compared with the risk of elderly whites is 2.2. When age is controlled, the relative risks of black men and women as compared with their white counterparts are 2.4 and 2.1, respectively. Even when the effects of age and sex are simultaneously controlled, the effect of race on septicemia mortality still persists. Using white elderly women as the reference, relative risks for the age-sex-race specific groups are presented in Table 3. Black men and black women are at the highest risk of dying from septicemia.

### Discussion

The thirty-five year history of a rising trend in age-adjusted mortality due to septicemia is largely accounted for by a substantial rise in septicemia deaths among the elderly. Three theories to account for this development are appropriate. The first is that the trend reflects a higher level of ascertainment of septicemia by attending physicians. The second is that physicians are increasingly perceiving septicemia, when present, as a critical determinant of death. The third is that the risk of septicemia is increasing.

Our analyses to date indicate that elderly mortality due to septicemia is significantly associated with race. Black older persons have a risk twice that seen among their white counterparts. This differential is seen nationally and explicitly in Maryland. A less dramatic but significant difference is seen when male elderly are compared with female elderly. This variance between races and between sexes is not ascribable to different ascertainment or certification practices.

Excess septicemia mortality among the black elderly may be due to the higher prevalence of diabetes and the associated end organ diseases of the kidney, and by lower economic circumstances which may have an impact on nutritional status.

Our finding of a positive correlation between physician density and septicemia mortality explains, in part, the comparatively high rate noted for Maryland. It is rational to speculate that elderly patients residing

in a high physician density area are more likely to be subjected to increased hospitalization and, hence, to an increased risk of septicemia through invasive instrumentation and hospital infection. High physician density areas tend to have better facilities for diagnosis which results in a higher probability of discovering septicemia and leads to a higher rate of certification of death due to septicemia. About fifty percent of the variance in mortality which remains unaccounted for in our model could be due to many factors. For instance, differences in policies in regard to the use of diagnostic procedures (blood cultures in this case) among hospital medical staffs, and the adoption and interpretation of different clinicopathologic algorithms among physicians may have a substantial impact on the manner in which septicemia is classified. Although the authors did not attempt to investigate a consistent interstate variance in septicemia mortality over time, the same pattern of mortality is found in 1987 as was described in 1985.

Our study leads to the conclusion that (1) the rising trend in mortality due to septicemia is attributable chiefly to the elderly population aged sixty-five years and over; (2) there is a significant variation in age-adjusted septicemia mortality rates among the states; and (3) states with a high percentage of blacks, a high physician density, and a high rate of hospitalization among elderly persons are more likely to have higher rates of septicemia.

Further research clarifying the risk factors resulting in elevated mortality due to septicemia among black elderly persons is strongly recommended.

The increase in death due to septicemia appears to reflect a growing perception that overwhelming infection is a problem of considerable import. The burden of illness associated with aging is often modifiable by surgery, other invasive procedures, and hospitalization. The benefits of such interventions are accompanied by risks, one of which is death due to septicemia. This risk, if aggressively addressed, may be reduced by primary and secondary prevention.<sup>25</sup>

# **You know an addict.**

As a physician, addiction is something you must deal with either in your patients, in your colleagues, or in yourself.

Addiction takes many forms – drugs, alcohol, nicotine, food, sex – and can be most efficiently diagnosed and treated when you have the most recent information available.

Med Chi's Annual Conference on Addiction and Physician Health provides you with this information.

**Attend the Medical and Chirurgical Faculty of Maryland  
Physician Rehabilitation Committee's**

## **Second Annual Conference on Addiction and Physician Health.**

And learn how to:

- aid in the early detection and treatment of chemically dependent patients;
- use a traditional addiction treatment approach in the treatment of eating disorders;
- help your patients stop smoking;
- relate the patterns of substance abuse to adolescents; and
- apply the methods of assessment and treatment for alcoholism to various age groups.

**Date:** Saturday, November 16, 1991

**Time:** 8:00 a.m. – 5:45 p.m.

**Fee:** \$50 Med Chi members/\$100 physician non-members/\$25 allied health professionals/NO CHARGE students and residents  
(continental breakfast, lunch and breaks provided)

**Location:** Med Chi Faculty Building, 1211 Cathedral Street, Baltimore, MD 21201

**To register, use form on facing page.**

**For more information call (301)539-0872 in Baltimore  
or 1-800-492-1056 elsewhere in Maryland.**

The Medical and Chirurgical Faculty of Maryland designates this continuing medical education activity for 7 credit hours in Category 1 of the Physician's Recognition Award of the American Medical Association.

## Schedule: Second Annual Conference on Addiction and Physician Health

- 8:00 a.m. – 8:45 a.m. **Registration/Check-in**  
(continental breakfast)
- 8:45 a.m. – 9:00 a.m. **Conference Overview**
- 9:00 a.m. – 10:00 a.m. **The Role of the Primary Care Physician in the Treatment of Chemical Dependence**

*Dan H. McDougal, M.D., Med Chi Physician Rehabilitation Committee*

- 10:00 a.m. – 11:00 a.m. **Assessment and Treatment of Alcoholism in Different Age Groups**

*Franklin T. Evans, M.D., Chairman, Med Chi Committee on Alcoholism and Chemical Dependence*

- 11:00 a.m. – 11:15 a.m. **Break**

## Clinical Observations

### Hyperemesis Gravidarum Treated with Lorazepam

**H**yperemesis gravidarum remains a puzzling, resistant, and debilitating condition, painful to both the patient and her physician. The following report details a simple and safe treatment regimen that, in the following instances, resulted in dramatic, sustained remission of this condition, with no apparent ill effects to either mother or child.

Mrs. M, a twenty-six year old caucasian female, first presented at age twenty, six weeks pregnant, and with a two-week history of uncontrollable vomiting. Hospitalization had been required because of the failure of outpatient treatment to control the vomiting. I was asked to see the patient in psychiatric consultation. Several months earlier I had treated her for her first episode of panic attacks. Because this pregnancy had occurred out of wedlock, the suspicion was raised that her hyperemesis might have stemmed from, or been aggravated by, psychogenic stress. The patient seemed well enough adjusted to her situation, but because of the obvious potential for guilt and anxiety, and the absence of other etiology, a trial of Lorazepam, which had been very successful in helping to manage her panic attacks, seemed indicated.

After consultation with the drug's manufacturer, which failed to reveal any evidence of fetal damage in their extensive database, we administered Lorazepam 1 mg IM. Surprisingly, within thirty minutes, the intractable nausea and vomiting ceased entirely. We were able to almost immediately begin oral fluids. We maintained the patient on Lorazepam 3 mg PO, gradually generalized her diet, and discharged her, asymptomatic, three days later on a maintenance dose of Lorazepam 2 mg without recurrence.

Two years later, the patient again became pregnant. This time, she was happily married, the pregnancy was planned, and there was no intervening recurrence of panic symptoms or other anxiety conditions. Yet again, in the sixth week of her pregnancy, hyperemesis recurred, as intractable as during her first pregnancy. Again, an initial dose of Lorazepam 1 mg IM, followed by 2 mg PO in divided doses, brought immediate and sustained relief. This time, however, a Resident was treating another woman with hyperemesis on the unit. Hearing of our success, he treated his patient with the same regimen with similar success.

Fifteen months later, our patient again became pregnant in a planned pregnancy. Again, this third episode of hyperemesis required hospitalization for failure to respond to the more customary measures. Again, she responded promptly to the Lorazepam regimen.

Our patient now has three apparently healthy children four years, two years, and six months old. All three deliveries and subsequent development have occurred without complications.

Interestingly, inquiries of a number of obstetrical colleagues failed to reveal awareness or utilization of Lorazepam for hyperemesis. However, the drug company seemed quite aware of the anti-emetic properties of Lorazepam. We also learned that our colleagues in oncology have for some time been using Lorazepam as one component in an anti-emetic "cocktail" given to patients being treated with chemotherapy.

#### "Clinical Observations" is a new

feature being instituted by *MMJ*. Its purpose is to encourage an open forum for physicians to report unique clinical observations in a brief and informal manner without the necessity of structured case reports and statistical validation.

These reports should be brief and represent preliminary insight into areas of diagnosis or therapy.

Send your manuscripts to Clinical Observations, *Maryland Medical Journal*, 1211 Cathedral Street, Baltimore, MD 21201-5585.

### Adjuvant Therapy for Patients with Colon and Rectal Cancer: Summary of the National Institutes of Health (NIH) Consensus Statement

Colorectal cancer is a major health problem in the United States. More than 150,000 new cases of colon and rectal cancer will be diagnosed in 1990, and approximately 75 percent will have a primary surgical resection with the hope of complete tumor eradication. In spite of this high resectability rate, nearly half of all colorectal patients die of metastatic tumor.

Adjuvant therapy is administered in addition to surgical treatment of the primary colorectal cancer with the intent to improve outcome. Treatment regimens include chemotherapy, radiation therapy, immunotherapy or combinations of these. While the testing of adjuvant therapies for colorectal cancer has spanned thirty years, it is only in the past decade that a number of clinical trials have yielded positive results.

In order to evaluate this recent data and resolve the major issues regarding the use of adjuvant therapy for colorectal cancer, the National Cancer Institute and the National Institutes of Health (NIH) Office of Medical Applications of Research sponsored a Consensus Development Conference on Adjuvant Therapy for Patients with Colon and Rectal Cancer on April 16-18, 1990. Based on scientific presentations and discussions from physicians, scientists, health care professionals, and the general public, a thirteen-member panel wrote a consensus statement. Following are the panel's findings:

- Patients with Stage I colon and rectal cancers are at low risk of recurrence and do not warrant adjuvant therapy. For these groups, surgical resection remains the treatment of choice.
- For colon cancer, current clinical trial data indicate adjuvant therapy with 5-fluorouracil (5-FU) and levamisole is effective for Stage III disease and should be offered to patients unable to enter a clinical trial, unless medical or psychosocial contraindications exist. Specific adjuvant

therapy cannot be recommended at this time for Stage II patients outside of clinical trials.

- For rectal cancer, recent clinical data indicate postoperative adjuvant treatment combining chemotherapy and radiation therapy improves local control and survival for Stage II and III patients. The most effective combination at present appears to be 5-FU, methyl-CCNU, and high-dose pelvic irradiation. However, the use of methyl-CCNU outside of ongoing clinical trials is discouraged because of documented toxicities.
- The American Joint Committee on Cancer system for classifying stages of colon and rectal cancer, also known as the TNM system, effectively describes patients at risk for recurrence and should be used in clinical trials research and clinical practice. Its use is recommended in place of other staging systems, including the Dukes classification.
- Clinical trials are essential for identifying new and refining current adjuvant therapies for colon and rectal cancers. Entry of Stage II and III patients into these trials is encouraged. Separate clinical trials should be conducted for patients with colon and rectal cancer to better define appropriate adjuvant strategies for each group.
- There is a need to better identify with biologic, anatomic, or genetic characteristics those early-stage patients at risk of recurrence who may benefit from adjuvant therapy. The panel also expressed the need to address the issues of quality of life and cost benefit of adjuvant therapy for patients.
- Future clinical trials should address a number of areas. The panel urged trials to improve the effectiveness of current modalities by integrating radiation therapy (for rectal cancer) and adding immune system stimulators (for colon and rectal cancer). They also recommended that researchers seek a better understanding of the mechanisms of action of the drugs in various treatment regimens. Finally, clinical trials for adjuvant therapy should examine differences in incidence and survival in various ethnic and socioeconomically disadvantaged groups.

Single copies of the complete *NIH Consensus Statement on Adjuvant Therapy for Patients with Colon and Rectal Cancer* may be ordered from the Office of Medical Applications of Research, NIH, Building 1, Room 260, 9000 Rockville Pike, Bethesda, MD 20892 (301-496-1143).

### Adjuvant Treatment of Colorectal Cancer: Response to the NIH Consensus Summary Statement

More than 150,000 new cases of colorectal cancer are diagnosed each year in the United States. Approximately 110,000 of these cases are colon cancers, defined as tumors rising above the peritoneal reflection of more than 12 cm proximal to the anal verge, and 45,000 are rectal cancers. These tumors account for about 14 percent of all cancer deaths. The overall incidence of colorectal cancer, furthermore, has been increasing over the past three decades. While some 75 percent of patients have resectable tumors,

nearly half of all patients will ultimately die of metastatic disease. Because of this, a great deal of attention has been focused on adjuvant therapy.

The rationale of adjuvant therapy is based on the concept that patients with resected tumors who subsequently relapse must have had micrometastases at the time of resection, and that therapy is most effective when the tumor burden is minimal and consists of actively dividing cells.

Over the past thirty years, numerous studies of ad-

juvant therapy have been conducted, but not until the past few years have larger, prospective studies given reproducible positive results.

In the 1970s, the Veterans Administration Surgical Adjuvant Group (VASAG) conducted a series of studies employing thiopeta, fluorodeoxyuridine (FUDR), then 5-fluorouracil (5FU), either alone or in combination with methyl-lomustine (Me-CCNU). These studies tended to indicate a small benefit for the treated patients, but results were not statistically significant.<sup>1</sup> Other adjuvant studies performed by the Central Oncology Group,<sup>2</sup> Li,<sup>3</sup> Mavligit,<sup>4</sup> and others were generally small uncontrolled studies using historical controls, but they were instrumental in the design of subsequent trials.

More recently, the Gastrointestinal Tumor Study Group (GITSG)<sup>5</sup> published results in 1984 showing no difference in recurrence rates in colon cancer patients treated with chemotherapy in the form of 5FU and Me-CCNU or immunotherapy when compared with surgery alone. A separate GITSG study<sup>6</sup> in Stage B<sub>2</sub>, C<sub>1</sub>, and C<sub>2</sub> rectal cancer patients, however, did show some benefit. Patients treated with surgery alone experienced a recurrence rate of 52 percent, those treated with radiotherapy (4,000 to 4,800 rads) recurred 36 percent of the time, those treated with 5FU and Me-CCNU 39 percent, and those with combined radiation and chemotherapy only 21 percent of the time. The results of this study were quite notable in showing benefit for adjuvant treatment in rectal cancer patients, as well as demonstrating the benefit of combined modality therapy.

In 1988, the National Surgical Adjuvant Breast and Bowel Project (NSABP)<sup>7</sup> C-01 study involving more than one thousand colon cancer patients demonstrated a modest, although significant, improvement in disease-free survival for patients treated with Me-CCNU, vincristine, and 5FU. At five years, the surgery alone patients were 1.29 times more likely to recur and 1.31 times more likely to die than patients given chemotherapy. No benefit was seen in the BCG arm. This study represented the first large, randomized, prospective trial showing significant survival benefit for adjuvant therapy in colon cancer; however, recent data suggest a decrease in benefit with time.

While these studies were in progress, a variety of studies employing portal vein infusions of 5FU were conducted. The rationale behind this treatment is that the major cause of mortality in colon cancer is from hepatic metastasis. Taylor<sup>8</sup> reported decreased hepatic metastases and improved survival in patients given hepatic vein 5FU for seven days after tumor resection. The NSABP,<sup>9</sup> in a confirmatory study, demonstrated a significant improvement in disease-free survival (74 percent v 64 percent) for treated patients. However, there was no decrease in hepatic metastases seen with portal vein infusions, and it was concluded that any benefit seen may have been due to a systemic effect of the infusion.

The foundation for the present National Institutes of

Health (NIH) Consensus recommendation dates back to a study by Verhaegen,<sup>10</sup> published in 1978, in which patients receiving postoperative levamisole had a demonstrably improved survival. While this study had various flaws, it did lead to a trial by the North Central Cancer Therapy Group (NCCTG).<sup>11</sup> This study randomized 401 patients with Dukes' B<sub>2</sub> and C cancers to treatment with surgery alone, levamisole, or 5FU plus levamisole. 5FU plus levamisole produced a significant improvement in disease-free survival (DFS) when compared with surgery alone, while the levamisole-only arm gave borderline DFS benefit. In the subgroup of B<sub>2</sub> and B<sub>3</sub> patients, there was no difference between the three study arms. In patients with Dukes' C colon cancer however, 59 percent of patients receiving the combinations survived disease-free versus 45 percent of surgery-only patients at five years. Levamisole alone did not have a significant impact on survival.

A confirmatory study was then conducted by the Southwest Oncology Group (SWOG), the Eastern Cooperative Oncology Group (ECOG), and the NCCTG. Last year, this Intergroup Study<sup>12</sup> published results with a median three-and-one-half-year follow-up. Significant benefits in disease-free survival and overall survival were seen in patients with Stage C disease, with 66 percent of 5FU-levamisole patients free of disease versus 49 percent of levamisole patients and 47 percent of surgery-only patients. Overall survival figures were 74 percent, 65 percent, and 64 percent, respectively, and it was concluded that there was a 41 percent decrease in the risk of relapse and a 33 percent decrease in the risk of death for patients treated with the combination. There was no significant benefit in patients with B<sub>2</sub> disease, although fewer patients in the treated group had relapsed at the time of the report.

The NIH Consensus panel<sup>13</sup> reviewed these and other studies on April 16-18, 1990 and made several recommendations.

- First was the adoption of the Tumor/Node/Metastasis (TNM) or American Joint Committee on Cancer System of Staging, as opposed to the older Dukes' system or its several modifications (Table 1). Stages I through IV would roughly correspond to Stages A through D (Table 2).
- It was felt that patients with Stage I disease were at a low risk of recurrence and did not require adjuvant therapy. The panel was less firm on Stage II patients, for whom no significant benefit was found in the studies, but adjuvant therapy was not recommended for such patients outside of a clinical trial.
- Stage III colon cancer patients seemed to benefit from combined 5FU-levamisole, and those patients unable to enter a trial should be offered this therapy.
- Stage II and III rectal cancer patients should be offered postoperative adjuvant therapy with radiation and chemotherapy. The most effective

**Table 1. Tumor/Node/Metastasis (TNM) Staging**

TX	Primary tumor cannot be assessed
TO	No evidence of primary tumor
Tis	Carcinoma in situ
T1	Tumor invades submucosa
T2	Tumor invades muscularis propria
T3	Tumor invades through the muscularis propria into the subserosa, or into nonperitonealized pericolic or perirectal tissues
T4	Tumor perforates the visceral peritoneum or directly invades other organs or structures
NX	Regional lymph nodes cannot be assessed
NO	No regional lymph node metastasis
N1	Metastasis in 1-3 pericolic or perirectal lymph nodes
N2	Metastasis in 4 or more pericolic or perirectal lymph nodes
N3	Metastasis in any lymph node along the course of a named vascular trunk
MX	Presence of distant metastasis cannot be assessed
MO	No distant metastasis
M1	Distant metastasis

**Table 2. TNM Staging**

	Tis	NO	MO	Dukes'
Stage O	Tis	NO	MO	
Stage I	T1	NO	MO

Stage II	T3	NO	MO	
	T4	NO	MO	} B
Stage III	Any T	N1	MO	
	Any T	N2,N3	MO	
				} C
Stage IV	Any T	Any N	M1	} D

chemotherapy in the various trials appeared to be 5FU plus methyl-CCNU, but the NIH panel was cautious in recommending Me-CCNU outside of a trial because of the renal toxicity and leukemogenic properties of this drug.

For the practicing oncologist, this Consensus Conference was quite helpful but also raised many other issues. The use of 5FU and levamisole, according to the NCCTG and Intergroup protocol, can be considered standard of care for our Stage III (Dukes' C) colon patients. While the use of this treatment for Stage II (B<sub>2</sub>, B<sub>3</sub>) patients outside of a clinical trial was not recommended, certain prognostic features have been identified which define a group of high-risk patients, including those whose tumors perforate the bowel wall and invade adjacent organs or structures; those with a preoperative carcinoembryonic antigen (CEA) greater than 5' aneuploid deoxyribonucleic acid (DNA) content, high S phase activity, colloid, signet ring, or poorly differentiated histology; or 17p or 18p deletions. It is likely and reasonable that such Stage II patients may be offered adjuvant therapy in the community setting. While the Consensus Panel was rather conservative in this regard, a review of the Intergroup Study indicated that only twenty-two of 159 B<sub>2</sub> patients receiving 5FU plus levamisole relapsed at three-and-one-half years, compared with thirty-two of 159 surgery-alone

patients. While these results are not statistically significant, if they persist it would seem logical that adjuvant treatment would ultimately be recommended for this group also.

Other issues which need further clarification are the mechanisms of action of levamisole and definition of the best schedule for use of this drug. Interestingly, 5FU-levamisole has not been particularly beneficial in patients with metastatic disease, and it is clear that 5FU-leucovorin is a better combination in these patients. It is quite likely then that leucovorin rather than, or even in addition to, levamisole may be the agent of choice to be used with 5FU in the adjuvant setting. Indeed, these studies are in progress. Prolonged infusions of 5FU have also demonstrated improved response rates in unresectable colon cancer and this might also prove to be better than bolus 5FU-levamisole in the adjuvant setting.<sup>14</sup> Finally, the use of other 5FU modifying agents such as alpha interferon of Phosphonacetyl-L-Aspartic Acid (PALA) may also prove beneficial in the future trials.

For Stage II and III rectal cancer patients, many community oncologists have employed postoperative radiation and chemotherapy since the original publication of the GITSG 7175 study. A second GITSG study (7180) compared radiation with 5FU or 5FU plus methyl-CCNU.<sup>15</sup> Preliminary analysis suggested no differences in recurrence rates, implying that Me-CCNU may be unnecessary. In fact, a recently cited interim report from the North Central Cancer Treatment Group<sup>16</sup> reveals a recurrence rate 1.2 times higher for patients receiving Me-CCNU. While no survival data are yet available, the increased toxicity and lack of definite improved effectiveness from Me-CCNU suggest that elimination of this agent (or the commercially available CCNU) from drug protocols would be prudent.

The NIH recently disseminated a clinical announcement updating last year's Consensus Conference,<sup>17</sup> not only calling attention to the Me-CCNU data, but also raising the question of 5FU/levamisole or 5FU/leucovorin in the adjuvant therapy of rectal cancer. It also further reviewed the results of several clinical trials, all of which confirmed improved survival from combined modality therapy.

## A Clinical Moment With . . . Diabetes

### Self-management of Diabetes

*Doctor, now that I have a blood glucose testing machine which I use two to three times per week and adjust my insulin accordingly, why do I need to return to your office on a regular basis for the care of my diabetes?*

This question is one that is asked often. The physician can easily list at least ten reasons why close physician supervision of the diabetic patient is important, including the items and techniques that the physician must check.

1. *Technique and equipment.* The patient's technique and his or her equipment needs to be tested for accuracy. It is surprising how sloppy technique can become over a short period of time. Also, the instrument needs to be cleaned by the office staff at almost every visit.

2. *Insulin administration.* Frequent measurement errors occur, especially if insulin mixtures are being used or if the patient is making unsupervised adjustments of the insulin dose. Injection sites should be examined for adequate rotation to avoid lipodystrophy and scarring.

3. *Glycohemoglobin.* The level of glycohemoglobin should be measured twice a year or as appropriate for the degree of diabetic control maintained.

4. *Urine.* Urine should be tested for ketones, glucose, protein, and infection.

5. *Meal plan.* The meal plan should be reviewed and adjusted as appropriate for the patient's weight and activity.

6. *History.* The patient's history should be reviewed for chest pain, shortness of breath, possible hypoglycemic reactions, or ketosis.

7. *Diabetes identification card.* The card should be checked for accuracy as to address, telephone number, and insulin dose. Also, the physician needs to deter-

mine if the patient carries a usable form of glucose to treat hypoglycemic reactions.

8. *Glucagon unit.* Unless the patient lives alone, a disposable glucagon unit should be on hand at home. It should be brought to the office occasionally to confirm that its expiration date has not passed and so that the patient's technique can be reviewed.

9. *Physical condition.* The patient's blood pressure and weight should be checked, along with his or her feet for pulses, fissures, pressure points, hygiene, and status of nail care. The shoes should be examined for fit, interior roughness, run-over heels, and condition of soles. In addition, one should look for evidence or history of peripheral neuropathy, checking the skin, mouth, and other common sites for possible infection.

10. *Eyes.* Finally, the fundi should be evaluated for retinopathy and the patient urged to seek regular supervision by an ophthalmologist.

In addition to the above, the diabetic patient should have an annual physical examination including an electrocardiogram (EKG), complete blood count (CBC), and blood chemistries. The patient should be advised to participate in an annual diabetes update education course. If the patient has never participated in a good diabetes education program of approximately forty hours, that should be recommended rather than the update program. This is important regardless of the number of years since the onset of diabetes. Both diabetic patients and many physicians get a false sense of adequacy of their understanding about the disease from past training. The explosion of knowledge since the general use of self-monitoring of blood glucose, food package labeling, and newer insulins brings about a constant need for continuing diabetes education and updating.

## Physician Placement Services

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

**Physician Placement Service**  
**1211 Cathedral St., Baltimore, MD 21201-5585**  
**(301-539-0872)**

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

## Board of Physician Quality Assurance Actions

In the Matter of  
Tati I. Okereke MD  
Before the  
Maryland Board of  
Physician Quality Assurance

### Final Order

On December 5, 1988, Tati I. Okereke MD (the Applicant) applied to the Board of Physician Quality Assurance (the Board) for a license to practice medicine in the State of Maryland. The Board, pursuant to the Maryland Medical Practice Act (the Act), *Md. Health Occ. Code Ann.* §14-205, notified the Applicant that there was reason to initially deny the Applicant's application for licensure.

Specifically, pursuant to §14-504(a)(1) and §14-504(a)(21) of the Act, the Board charged that the Applicant:

Fraudulently or deceptively obtains or attempts to obtain a license ... [HO §14-504(a)(1)]; and

Is disciplined by a licensing or disciplinary authority ... for an act that would be grounds for disciplinary action under this section [HO §14-504(a)(21)].

The underlying grounds actionable under HO §14-504(a)(21) include the following:

Fraudulently or deceptively obtains or attempts to obtain a license ... [HO §14-504(a)(1)];

Fraudulently or deceptively uses a license [HO §14-504(a)(21)];

Is guilty of ... unprofessional conduct in the practice of medicine [HO §14-504(a)(3)];

Solicits or advertises in violation of 14-605 of this title [HO §14-504(a)(5)];

Willfully fails to file or record any medical report as required under law, willfully impedes or obstructs the filing or recording of the report ... [HO §14-504(a)(12)]; and

Solicits professional patronage through an agent or other person or profits from the acts of a person who is represented as an agent of the physician [HO §14-504(a)(14)].

### Findings of Fact

The Board finds as follows:

1. The Applicant, Tati I. Okereke MD, filed an application for medical licensure on December 2, 1988.

2. The Applicant was notified by the Board on October 24, 1990 that there was reason to initially deny the Applicant's application for medical licensure.

3. The applicant was informed that a Final Order denying the application for medical licensure would be entered thirty days from the Applicant's receipt of the Board's Notification, unless the Applicant requested a hearing.

4. The Applicant received the Board's Notification of Initial Denial on/about November 5, 1990.

5. The Applicant had to request a hearing by December 7, 1990 in order for the Board not to execute this Final Order.

6. The Applicant did not request a hearing by December 7, 1990, nor by February 9, 1991.

The Board further finds [as to HO §14-504(a)(1)]:

1. The Applicant was authorized to engage in the practice of medicine in the State of New York on January 25, 1972 by the issuance of License Number 111470 by the New York State Education Department.

2. On or about December 5, 1988, the Applicant applied for medical licensure in the State of Maryland by filing an application with the Board.

3. In the Applicant's application for medical licensure to the Board, the Board requested the following information in question 16: "Have you ever been charged with violation of any law relative to practice of medicine or relative to any crime (felony)?"

4. In answer to question 16, the Applicant filed the following answer: "had med. misconduct. hearings. No felony charge."

5. The Applicant failed to disclose the fact that in 1983 and 1986, he had been indicted by the Grand Jury of the County of Erie, State of New York under Grand Jury Indictment Numbers 82-1579-001, 82-1579-SO1, and 82-1579-SO2 for the charges of bribing a witness, a class D felony under New York State Penal Law §215; and sexual misconduct, a class A misdemeanor, under New York State Penal Law §130.20.

6. In the Applicant's application for medical licensure to the Board, the Board requested the following information in question 17: "Have you ever been found guilty in a malpractice suit or settled a malpractice claim?"

7. The Applicant failed to disclose that he had settled a medical malpractice action on June 2, 1987, entitled *Guth v Okereke and Children's Hospital of Buffalo*.

8. The State of Maryland application for medical licensure contains a provision certifying that the information supplied in the application is true and accurate to the best of the applicant's knowledge. The Applicant signed and dated this provision of the application at the time the application was filed with the Board.

9. The Applicant attempted to fraudulently and/or deceptively obtain a medical license in the State of Maryland in that he willfully failed to disclose the above facts in his application for medical licensure.

[As to HO §14-504(a)(21)]:

10. The Applicant was authorized to engage in the practice of medicine in the State of New York on January 25, 1972 by the issuance of License Number 111470 by the New York State Education Department.

11. On or about July 31, 1981, the New York State Board for Professional Medical Conduct, through the New York State Department of Health, charged the

Applicant with the commission of a series of violations of §§6509 and 6509-a of the Education Law of the State of New York (NY Educ. Law) as these provisions relate to professional misconduct. Unprofessional conduct as it relates to the aforementioned sections of the NY Educ. Law is further defined in the Rules of the Board of Regents on Unprofessional Conduct, §§29 *et seq* (8NYCRR29).

12. On nine dates between August 27, 1981 and February 1, 1983, a disciplinary hearing was held before a hearing committee of the New York State Board for Professional Medical Conduct (the Hearing Committee). In March 1983, the Hearing Committee found and concluded that the Applicant had violated certain specifications contained in the Statement of Charges relating to provisions of the NY Educ. Law that apply to professional misconduct, including the following:

- A. The Applicant practiced fraudulently within the meaning of NY Educ. Law 6509, Subdivision 2 (McKinney's Supp. 1980) in that from on or about September 1, 1979 through on or about May 1, 1980, the Applicant engaged in an arrangement with a purported not-for-profit corporation called Erie Women's Center, located in Erie, PA whereby the Applicant provided money to this purported referral service in exchange for referrals of patients to his office.
- B. The Applicant committed unprofessional conduct within the meaning of NY Educ. Law 6509, Subdivision 9 (McKinney's Supp. 1980), as further defined in 8NYCRR29, in that:
  - i) The Applicant failed to file fetal death certificates within the required time.
  - ii) The Applicant provided money to a referral service in exchange for referrals of patients to his office.
  - iii) The Applicant engaged in an arrangement with a purported not-for-profit corporation whereby the Applicant provided money to this purported referral service in exchange for referrals of patients to his office.
  - iv) The Applicant permitted an unauthorized third party, as set forth in 8NYCRR29.1(b)(4), to share in fees received by the Applicant for professional services.
  - v) The Applicant engaged in conduct in the practice of medicine which constituted moral unfitness in the practice of medicine in that:
    - a. The Applicant failed to file fetal death certificates within the required time.
    - b. The Applicant provided money to a referral service in exchange for referrals of patients to his office.
  - vi) The Applicant, in causing to be created a purported not-for-profit corporation called Erie Women's Center, whereby said corporation would advertise the availability through the Applicant, advertised or solicited in a manner not in the public interest and was deceptive

and misleading by purporting to be a public-spirited organization when, in fact, its purpose was to provide the Applicant with abortion patients.

- C. The Applicant participated in the division, transference, assignment, rebate, splitting, or refunding of fees for the furnishing of professional care or services within the meaning of NY Educ. Law 6509-a (McKinney's Supp. 1980) in that from on or about September 1, 1979 through on or about May 1, 1980, the Applicant engaged in an arrangement with a purported not-for-profit corporation called Erie Women's Center, whereby the Applicant provided money to this purported referral service in exchange for referrals of patients to his office.

13. On or about January 3, 1986, the Commissioner of Health of the State of New York (the Commissioner of Health) recommended that the New York State Board of Regents (the Board of Regents) adopt in full the findings of fact, conclusions, and recommendations published by the Hearing Committee in regard to the aforementioned matters.

14. On or about July 31, 1986, the New York State Regents Review Committee (the Regents Review Committee) recommended to the Board of Regents that the findings and conclusions of the Hearing Committee and the Commissioner of Health be accepted.

15. On or about September 26, 1986, the Board of Regents adopted the findings of fact and conclusions of the Hearing Committee and the Commissioner of Health. It further modified the recommendations of the Hearing Committee and the Commissioner of Health as to the measure of discipline recommended for imposition. The Board of Regents voted to suspend the Applicant's license to practice medicine for three years upon each specification of the charges of which the Applicant had been found guilty; that such suspensions were to run concurrently; that execution of the last two years and nine months of said suspensions were to be stayed, at which time the Applicant would be placed on probation for three years; and that the Applicant be fined a total of \$15,000.

16. On or about October 15, 1986, the above disciplinary sanctions were imposed by the New York State Commissioner of Education (the Commissioner of Education) by Order #5929.

17. The actions undertaken and referred to above in §12 of this Notice of Intent to Deny Application for License (the Notice) pursuant to NY Educ. Law §6509 *et seq* are considered professional disciplinary actions by the State of New York.

18. The above-mentioned professional disciplinary action undertaken by the State of New York and referred to in §12(A) of the Notice, *supra*, would be grounds for disciplinary action in the State of Maryland under §14-504 of the Act. (See HO §14-504(a)(2), (3), and (14).)

19. The above-mentioned professional disciplinary action undertaken by the State of New York and

referred to in §12(B)(i) of the Notice, *supra*, would be grounds for disciplinary action in the State of Maryland under §14-504 of the Act. (See HO §14-504(a)(3) and (12), and *Md. Health Gen. Code Ann.* §4-213.)

20. The above-mentioned professional disciplinary action undertaken by the State of New York and referred to in §12(B)(ii) of the Notice, *supra*, would be grounds for disciplinary action in the State of Maryland under §14-504 of the Act. (See HO §14-504(a)(3) and (14).)

21. The above-mentioned professional disciplinary action undertaken by the State of New York and referred to in §12(B)(iii) of the Notice, *supra*, would be grounds for disciplinary action in the State of Maryland under §14-504 of the Act. (See HO §14-504(a)(3) and (14).)

22. The above-mentioned professional disciplinary action undertaken by the State of New York and referred to in §12(B)(iv) of the Notice, *supra*, would be grounds for disciplinary action in the State of Maryland under §14-504 of the Act. (See HO §14-504(a)(3) and (14).)

23. The above-mentioned professional disciplinary action undertaken by the State of New York and referred to in §12(B)(v)(a) of the Notice, *supra*, would be grounds for disciplinary action in the State of Maryland under §14-504 of the Act. (See HO §14-504(a)(3) and (12).)

24. The above-mentioned professional disciplinary action undertaken by the State of New York and referred to in §12(B)(v)(b) of the Notice, *supra*, would be grounds for disciplinary action in the State of Maryland under §14-504 of the Act. (See HO §14-504(a)(3) and (14).)

25. The above-mentioned professional disciplinary action undertaken by the State of New York and referred to in §12(B)(vi) of the Notice, *supra*, would be grounds for disciplinary action in the State of Maryland under §14-504 of the Act. (See HO §14-504(a)(3) and (5). Also see COMAR 10.32.01.09.)

26. The above-mentioned professional disciplinary action undertaken by the State of New York and referred to in §12(C) of the Notice, *supra*, would be grounds for disciplinary action in the State of Maryland under §14-504 of the Act. (See HO §14-504(a)(14).)

27. The actual suspension of the Applicant's medical license in the State of New York commenced on March 1, 1988 and terminated on May 31, 1988. The Applicant's medical license in the State of New York was then placed on a probationary status as set forth under Order #5929.

28. On or about February 15, 1989, the Applicant was charged by the New York State Board of Professional Medical Conduct, through the Department of Health, with violations of the terms of probation imposed as a result of Order #5929.

29. On four dates between April 13, 1989 and July 5, 1989, violation of probation hearings were held before an Administrative Law Judge (the ALJ) appointed by the New York State Department of Health. In a report entitled "Administrative Law Judge's Report," dated

November 28, 1989, the ALJ found that the Applicant violated certain conditions of his probation in committing the following acts:

- A. The Applicant willfully submitted false applications in seeking re-appointment for medical staff privileges at Children's Hospital of Buffalo, NY and evidenced moral unfitness in the practice of medicine in so doing, in violation of NY Educ. Law 6509, Subdivision 9, as further defined in 8NYCRR29.1(b)(5) and (6).
- B. The Applicant willfully submitted two applications for medical staff re-appointment to the Buffalo General Hospital, Buffalo, NY in which he provided false information, in violation of NY Educ. Law 6509, Subdivision 9, as further defined in 8NYCRR29.1(b)(5) and (6).
- C. The Applicant willfully submitted an application for licensure in the State of Maryland in which the Applicant provided false or misleading information, in violation of NY Educ. Law 6509, Subdivision 9, as further defined in 8NYCRR29.1(b)(5) and (6).

30. On or about July 10, 1990, the Regents Review Committee unanimously recommended to the Board of Regents that it accept the findings, conclusions of law, and recommendation of the ALJ.

31. On or about July 27, 1990, the Board of Regents, by Order Number 10761, voted to accept the recommendations of the Regents Review Committee as to the violation of probation proceedings. As a result, the Applicant's license to practice medicine in the State of New York was revoked, effective on or about August 11, 1990.

32. The actions undertaken and referred to above in §§29 and 30 of the Notice, pursuant to New York Public Health Law 230 *et seq* (McKinney Supp. 1989), are considered disciplinary actions by the State of New York.

33. The above-mentioned professional disciplinary action undertaken by the State of New York and referred to in §29(A) of the Notice, *supra*, would be grounds for disciplinary action in the State of Maryland under §14-504 of the Act. (See HO §14-504(a)(3).)

34. The above-mentioned professional disciplinary action undertaken by the State of New York and referred to in §29(B) of the Notice, *supra*, would be grounds for disciplinary action in the State of Maryland §14-504 of the Act. (See HO §14-504(a)(3).)

35. The above-mentioned professional disciplinary action undertaken by the State of New York and referred to in §29(C) of the Notice, *supra*, would be grounds for disciplinary action in the State of Maryland under §14-504 of the Act. (See HO §14-504(a)(1) and (3).)

### Conclusions of Law

Based on the foregoing Findings of Fact, the Board concludes the following:

1. The Applicant fraudulently and/or deceptively at-

tempted to obtain a license to practice medicine in the State of Maryland, under *Md. Health Occ. Code Ann.* §14-504(a)(1); and

2. The Applicant was disciplined by a licensing or disciplinary authority ... for an act that would be grounds for disciplinary action under this section, under *Md. Health Occ. Code Ann.* §14-504(a)(21). The underlying grounds actionable under this section include the following:

Fraudulently or deceptively obtains or attempts to obtain a license ... [HO §14-504(a)(1)];

Fraudulently or deceptively uses a license [HO §14-504(a)(2)];

Is guilty of ... unprofessional conduct in the practice of medicine [HO §14-504(a)(3)];

Solicits or advertises in violation of §14-605 of this title [HO §14-504(a)(5)];

Willfully fails to file or record any medical report as required under law, willfully impedes or obstructs the filing or recording of the report, or induces another to fail to file or record the report [HO §14-504(a)(12)]; and

Solicits professional patronage through an agent or other person or profits from the acts of a person who is represented as an agent of the physician [HO §14-504(a)(14)].

Accordingly, the Board has determined that it may deny the application of the Applicant for medical licensure in the State of Maryland, under *Md. Health Occ. Code Ann.* §14-205(a)(1)(iii).

### Order

After reviewing the application of Tati I. Okereke MD for medical licensure in the State of Maryland, it is

this 9th day of January 1991, by an affirmative vote of a majority of the full authorized membership of those members of the Board of Physician Quality Assurance who considered this case,

ORDERED that the application of Tati I. Okereke for medical licensure to practice medicine in the State of Maryland is DENIED, and be it further

ORDERED that this is a FINAL ORDER and as such will be considered a public document pursuant to *Md. State Gov't. Code Ann.* §10-611 *et seq* (1989 Cum. Supp.).

ISRAEL II. WEINER MD, Chairperson  
Maryland Board of Physician Quality Assurance

### Notice of Right to Appeal

Pursuant to *Md. Health Occ. Code Ann.* §14-508(a), any person aggrieved by a final decision of the Board in a contested case other than a case decided pursuant to *Md. Health Occ. Code Ann.* §14-504 may (1) appeal that decision to the Board of Review; and (2) then take any further appeal allowed by the Administrative Procedure Act.

Any person aggrieved by a final decision of the Board in a contested case in an action under *Md. Health Occ. Code Ann.* §14-504 may not appeal to the Secretary of Board of Review but may take a direct judicial appeal. Please be advised that your appeal from those matters involving §14-205 of the Act is to the Board of Review of the Department of Health and Mental Hygiene; and that you may take a direct judicial appeal from those matters involving §14-504 of the Act.

ISRAEL II. WEINER MD, Chairperson  
Maryland Board of Physician Quality Assurance

### Music Medicine Clearinghouse Volunteers

The Music Medicine Clearinghouse is looking for volunteers who can give a few hours a week to assist with the collection. Duties would include photocopying, filing, shelving, light typing, light data entry, etc. For further information, contact Susan Harman, Clearinghouse Coordinator, at 301-539-0872 or 1-800-492-1056 toll free in Maryland.

### MED CHI LIBRARY CHARGES

Effective May 1990

	Active Members	Affiliate, Associate, Fellow, and Resident Members
Borrowing from Book Collection	Free	Free
In-house Photocopying	5 articles free each month \$3.00 for each additional article	\$3.00 per article
Interlibrary Loans	\$3.00 per article plus charge from lending library	\$3.00 per article plus charge from lending library
Literature Searching	\$2.00 for each year searched	\$3.00 for each year searched
FAX surcharge	\$5.00 per article	\$5.00 per article

# Continuing...

For over fifteen years, the Med Chi Agency has been serving the needs of Maryland physicians...*your* needs, with unrivaled commitment and dedication. And as the Agency has grown, so has your trust...in us, in our products and in the way we do business with you.

As a comprehensive insurance agency, we are able to offer a wide range of insurance and financial options. Among these are:

Professional Liability Insurance (Malpractice)

Personal insurance, including homeowners, auto, boat and recreational vehicle coverage and personal umbrella insurance.

Office insurance, including medical equipment, medical records, computer equipment, account receivables, workers compensation, business auto and employee dishonesty

Financial and estate planning, specifically tailored to the medical professional.

Individual and group, life, health and income protection.

Qualified and non-qualified Retirement Planning

## How Richard Gundry Came to Maryland

Both Cordell's *Medical Annals* and Kelly's *Medical Biography* suggest that Dr. Richard Gundry came to Maryland as a result of party politics, though until now there has been little documentation of that fact. In 1989, as part of an ongoing effort to document the role of the Faculty in Maryland medicine, the History of Medicine Collection acquired twenty boxes of personal and professional papers of Richard Gundry (1830 - 1890). Located within was a letter from the Trustees of an Ohio hospital confirming the report of Cordell and explaining in no uncertain terms just why Gundry was replaced.

Not a great deal is known of Gundry's early years. We do know that he was born in 1830 in England, the son of a minister. It was after his father received an assignment in Canada that the future physician's history becomes a bit more firm. At first, young Richard Gundry took a job as a copyist for a local law firm. At this time, Gundry was still considering a career at the bar. This changed when, upon the suggestion of a coworker, he applied to the Harvard Medical School and was accepted. In 1855, Gundry graduated with the coveted first prize.

Gundry followed graduation with the requisite Grand Tour of Europe without which no nineteenth century college graduate could truly claim to be educated. It was on the return trip that fate, in the form of a cholera outbreak on board ship, took a hand in Gundry's life. As the only physician on board, other than the ship's doctor, Gundry's fellow travellers quickly became his patients. Gundry so impressed one of the passengers with his skill that once the ship had passed out of quarantine, the former patient suggested Gundry go with him to Ohio rather than returning to Boston as had been Gundry's original plan.

Upon arrival in Ohio, Gundry secured an appointment with the Sterling Medical College of Ohio as Demonstrator of Anatomy. Gundry's first appointment in the field which was to dominate his life, care of the mentally ill, was followed quickly with a temporary appointment as Assistant Physician in the Central Insane Asylum at Columbus, Ohio. "His fitness for the work was so apparent," according to one biographer, "that the temporary appointment soon became a permanent one."<sup>1</sup>

1857 saw Gundry's reputation as an "alienist"<sup>2</sup> grow with an appointment as Assistant Physician at the Southern Ohio Asylum in Dayton. This position rapidly gave way to a new appointment as Superintendent in 1861. This, in turn, was followed by a return to the Central Insane Asylum in Columbus as Director of the Hospital.<sup>2</sup>

Unfortunately for Gundry, his term as Director was to be short-lived. The election year of 1876 / 77, which elevated Republican Rutherford B. Hayes to the White House, brought another Republican, Thomas Young, to the Ohio State House. As the letter below shows, Gundry, an active Democrat, soon fell victim to the

Dr. Richard Gundry

spoils system -- a disease endemic to American politics in the latter part of the 19th century.<sup>3</sup>

Columbus, Ohio  
April 18, 1878

Dear Sir:

To prevent the misinterpretation of the appointment of Dr. Ellesbery to succeed you as Superintendent of the Columbus Asylum for the Insane, it is proper to state the only reason for this change.

In Ohio, both political parties have always placed the benevolent institutions of this State under the superintendence of persons belonging to the party in power. In pursuance of that policy, Dr. Ellesbery has been appointed.

It affords us pleasure to bear testimony to your unsullied character, to your great administrative abilities, and your superior skills as a Specialist in nervous diseases.

We beg you, dear sir, to accept the assurance of our personal esteem, and our best wishes for the happiness of yourself and family.

With sincere respects, we remain your very obedient servants.

K.J. Blo[umos]  
David W. Brooks  
G.W. Morgan  
Joseph P. Smith  
Ben Myers, M.D.  
Trustees, Columbus Asylum for the Insane

Since he was active in local politics, Gundry was doubtlessly familiar with this practice. Still, in the words of Henry Hurd, he was "dumbstruck" by this

blow to his career. Gundry began searching almost immediately for a new position and after only a short six-month search was offered the job of Superintendent at the Maryland Hospital for the Insane in Catonsville.<sup>4</sup> This decision by the Trustees of the Maryland Hospital proved to be a wise one for all concerned, but particularly for the patients. Gundry had long ago accepted a method of care which advocated freedom of movement and lack of restraints. He quickly began to implement these ideas at his new hospital.

Gundry quickly came to be respected by his professional peers in Maryland and was soon appointed Professor (1880) of "Mental and Nervous Diseases" and "Materia Medica" at the College of Physicians and Surgeons. He also became a member of the Medical and Chirurgical Faculty of Maryland that same year.

Gundry was a prolific author and a frequent contributor to the *Transactions of the Medical and Chirurgical Faculty of Maryland*, contributing such works as: "Some Problems of Mental Action" and "The Physical Manifestations of Disease" in 1881 and "The Relation of the Powers of the State to the Rights of the Individual in Matters Concerning Public Health" in 1883. Gundry was appointed to several Faculty Committees, most notably on a committee created to persuade the Maryland State Legislature to create a law providing for the care of the "feeble minded" children of Maryland.<sup>5</sup>

Gundry remained an active member of the Maryland

medical community, continuing as Director of the Hospital in Catonsville and maintaining a thriving practice until his death in 1890 of Bright's disease.

The materials donated to the Faculty include both personal and professional papers, including twelve bound notebooks of lectures and formulas, case records, and professional correspondence (1855-1889); books; certificates; and stereocards. In addition, there are three files of correspondence from Richard Gundry, Jr MD and Rachel Gundry MD.

### Notes

1. Hurd, Henry. *Institutional Care of the Insane*, "Biography of Richard Gundry," Baltimore: Johns Hopkins University, 1916.

2. A term popular among nineteenth and early twentieth century medical men, "Alienist" usually referred to someone who specialized in "nervous diseases." A good introduction to late 19th century psychiatry can be found in Brieger, Gert (ed). *Medical America in the Nineteenth Century: Readings from the Literature*. Baltimore: Johns Hopkins Press, 1972.

### Homewood Hospital Medical Staff Funds Scholarship

The Baltimore City Medical Society Foundation, Inc., has received \$75,000 as the first part of an endowment to establish a scholarship program in the name of the medical staffs of the North Charles General Hospital and the Wyman Park Medical Associates. At the closing of Homewood Hospital, the medical staff voted to give all of the funds left in its treasury to the BCMS Foundation, Inc. to fund a scholarship for a medical student from the State of Maryland. The first check presented to Dr. Beryl Rosenstein, President of the Foundation, was the bulk of the funds, but an additional amount will be forwarded when all bills have been paid by the medical staff office. It is expected that as much as another \$9,000 will be added to the initial contribution, bringing the endowment to \$84,000.

Scholarships in the name of "The Medical Staff of North Charles General Hospital and The Wyman Park

Medical Associates" will be awarded annually from the interest earned on the endowment. In accordance with the wishes of the medical staffs, scholarship recipients must be Maryland residents attending either the University of Maryland or The Johns Hopkins Medical Schools. The first award will be made in May 1992.

The Baltimore City Medical Society Foundation, Inc. was established in 1972 to support philanthropic activities in Baltimore and provide scholarships to medical school students. Prior to this gift, most of the funds available to the Foundation have been contributed by individual members of the Baltimore City Medical Society and their friends and families. The generous contribution from the medical staffs of North Charles General and Wyman Park Medical Associates will almost double the amount of money available each year for the scholarships.

### Liver Resections

Small lesions of the left lobe of the liver or drainage of simple cysts can be handled through a midline upper abdominal incision, but for most other major liver resections, I prefer a subcostal incision. This can be extended as a bucket handle incision to the left (i.e., by angling down parallel to the left subcostal region, or further to the right into the flank, or across for right thoracic extension). The abdomen should be diligently explored for evidence of other malignancy, infection, or metastasis. The nature and extent of the disease in the liver must be carefully assessed and the rest of the liver evaluated.

Intra-operative ultrasound has added to our diagnostic ability. This is in addition to palpating the normal appearing liver to rule out further metastasis. Needle core or wedge biopsy will often be useful to confirm the diagnosis before any major resection is undertaken. If resection is still being considered at this point, liver mobilization is indicated. Some lesions require little mobilization and others require almost complete dissection of all peritoneal attachments on one or both lobes. This may include division of the falciform ligament back to the inferior vena cava. The right or left triangular ligaments are severed, as well as the peritoneum on the right side of the inferior vena cava (for further mobilization of the right lobe of the liver). Such mobilization allows rotation of the liver to further evaluate it for resectability.

Evaluation of the gross characteristics of a lesion, biopsy when indicated, and mobilization sufficient to allow evaluation of resectability should be done without blood loss or the burning of bridges. Now is a good time to pause to make a final decision about resectability. If major resection is planned, the anesthesia team should be informed and the circulating nurse asked to contact the blood bank for readiness.

Simple cysts should have wide marsupialization by resection of a window of exposed capsule. The interior lining should be explored for epithelial patches suspicious of cystadenoma and for loculation. If continuous drainage is noted, such cysts can be drained to the outside or internally via a Roux-Y. If the cyst contains bile, one should attempt cystography and biopsy to look for connections with the bile ducts. Small focal nodular hyperplasia tumors will be totally excised for biopsy. However, if the diagnosis is made by incisional biopsy of a large centrally located nodular hyperplasia, it may be safer to leave such a lesion than to resect it. Symptomatic hemangiomas and large adenomas should be enucleated. If such lesions are large, preliminary hilar control should be carried out. Unresectable large adenomas can be managed by embolization.

Primary and secondary cancers should be resected with a margin of normal liver tissue. Small peripheral lesions are best resected by wedge excision. I have

carried out multiple wedge resections for metastatic lesions from large bowel cancer to both lobes of the liver. However, benefit was noted in those patients who have had one to three metastases. Large and centrally located lesions are best handled by anatomic dissections. *Segmental* resections are carried out for right lobe, left lobe, or centrally located lesions. Such limited resections are undoubtedly necessary to preserve function, especially in patients with cirrhosis. *Sublobar* resections can be carried out for the same reasons, but for somewhat bigger lesions. However, such an approach results in more blood loss than in a lobectomy. *Lobectomies* can be done more rapidly and safely. A line drawn from the bed of the gallbladder to the inferior vena cava separates the right lobe from the left lobe. The falciform ligament lies in the left lobe and separates the medial segment from the lateral segment of the left lobe of the liver. *Extended lobectomy* indicates the resection of one of the two lobes in addition to the resection of a neighboring segment. One should keep in mind that the remaining segment should maintain good hepatic artery and portal vein inflow, as well as hepatic vein outflow.

For all major liver resections, hilar dissection should be carried out first (i.e., prior to resection). The branches of the hepatic artery, portal vein, and biliary duct (at resection side) are ligated after dividing and ligating the cystic duct and removing the gallbladder separately or on the specimen side. This usually results in demarcating the site of resection. Glisson's capsule is severed by blade or scissors, the liver is dissected by the finger technique or blunt instrument, and the major vessels and ducts ligated. Finally, the hepatic vein or veins are dissected inside the liver, suture ligated, and severed as far as possible from the inferior vena cava.

*Postoperative care.* Recovery from cyst drainage or wedge resection parallels that after uncomplicated cholecystectomy. Recovery from a major resection depends on several factors:

1. Thoracic extension of the incision may lead to pulmonary complications.
2. Hepatocellular insufficiency due to cirrhosis or intraoperative technical problems may cause difficulties. Massive blood transfusion and hypotension during surgery may lead to hypothermia, coagulopathy, acute respiratory distress syndrome, and liver and renal failure. Hyperbilirubinemia may occur secondary to hemolysis of transfused blood rather than due to liver failure or bile duct injury. However, persistent jaundice, particularly with a direct bilirubin of more than 2.0 mgm/dl, should prompt concern for bile duct obstruction.
3. Serum albumin drops precipitously after major resection but begins to stabilize by the fifth or sixth postoperative day. Late complications may include:

bile leak and collection which is managed by continued drainage; and abscess formation related to dead space, hematoma, or an infarcted edge of the liver which is managed by radiological or operative drainage.

Most deaths associated with major liver resection are attributed to failure to control hemorrhage or to poor patient selection. The patient's welfare is also intimately connected with the technical competence and the experience of the surgeon.

## Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

### Saturday Evening Consultation

A live program  
Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.  
Broadcast across the country  
An hour-long program  
Call-in format: Physician answers questions from listeners

### Sunday Morning Consultation

A pre-taped program  
Sunday at 7:30 a.m.  
Broadcast on WBAL - AM radio  
A half-hour program  
Interview format: one-on-one talk with John Stupak

**Med Chi encourages all physicians to appear on these innovative programs. To register fill in the form below.**  
**Yes, I am interested in speaking on Consultation. Please contact me with scheduling information.**

## Auxiliary

### Vivian Reed Lynn: State Auxiliary President

**V**ivian Reed Lynn is the 1991-92 President of the Auxiliary to the Medical and Chirurgical Faculty of Maryland. She is the fourth State President from Prince George's County.

Mrs. Lynn was born in Kentucky and is a graduate of the Jewish Hospital School of Nursing in Cincinnati, Ohio. After receiving her RN, she continued her studies in liberal arts at the University of Cincinnati. She worked in the medical-surgical unit of Jewish Hospital and then became head nurse of the emergency room at William Booth Hospital in Covington, Kentucky. After moving to the Washington area in 1970, she worked as an operating room nurse at Cafritz Hospital in southeast Washington, DC and then at Sibley Hospital in northwest Washington. Mrs. Lynn left nursing in 1978 when her daughter, Andrea, was born. Andrea is now a seventh grader at Queen Anne School in Upper Marlboro.

Her husband, Dr. John T. Lynn, is a Board Certified Orthopaedic Surgeon whose practice is located primarily in Prince George's County. Dr. Lynn is a cofounder of Prince George's Orthopaedic Associates, a ten-member corporation of orthopaedic surgeons. He received his BA degree from Lehigh University and his medical degree from Jefferson Medical College in Philadelphia. Five years in family practice in Prince George's County was followed by a four-year orthopaedic residency under the Jefferson program at Philadelphia General Hospital. He is a past president of the Prince George's County Medical Society and the Metropolitan Washington Orthopaedic Society. Governor Schaefer recently reappointed him to a three-year director's term on the Maryland Board of Physician Quality Assurance (BPQA), the licensing and disciplinary commission for physicians and other paramedical personnel serving the citizens of Maryland.

Mrs. Lynn has been active in the Prince George's County Auxiliary since joining in 1978. She held the office of County President for two years, 1987-89. She was then elected Second Vice President in the State Auxiliary.

"Renew the Spirit" is the Auxiliary President's theme for the year 1991-92. She will emphasize a renewed dedication to the Auxiliary, its goals, and its work in Maryland. Mrs. Lynn's membership campaign will include the theme "Each One-Reach One." She feels that each member should be involved with membership by having personal contact with at least one prospective member, explaining to him or her the goals and purposes of the Auxiliary.

The Auxiliary will continue to work closely with the Medical and Chirurgical Faculty in legislative matters and continue to sponsor such activities as *Auxiliary's Day* in Annapolis, to help strengthen the medical com-

Vivian Reed Lynn

munity's relationship with the Legislature. A workshop on breast cancer awareness and education is planned for the Fall House of Delegates Meeting. Mrs. Lynn would like this health project to be carried out in all the county auxiliaries so that all auxiliary members are knowledgeable about mammography and self-examination for early detection of breast cancer.

Mrs. Lynn is very active in her community. She has been a volunteer for the Hospice of Prince George's County for five years. She is also active in her church, having served on the joint board as an elder, singing in the choir, and directing the youth group. She also served on the Pastoral Counseling Board of Greater Marlboro for six years. Mrs. Lynn has been a member of the Maryland Choral Society for two years and is active in her daughter's school. Her leisure time activities include aerobics, golf, needlework, and listening to classical music.

Mrs. Lynn feels that "Renewing the Spirit" of the Auxiliary will strengthen the organization and help to increase the membership, as well as enhance its dedication to its goals and purposes as partners in the health community. ■

## BOOK REVIEW BOOK REVIEW

*Infection Control in the Child Care Center and Pre-School.* Editor: Leigh G. Donowitz MD. Baltimore: Williams & Wilkins, 1991. 364 pages. \$26.00

As stated by the editor, the purpose of this book is to "provide childcare center and pre-school administrators, pediatricians and public health officers with a current and easy-to-read reference on common infection control issues in daycare." The list of contributors is impressive and their expertise cannot be disputed.

Sections I and II comprise fourteen pages of information on the transmission of diseases and the policies to be used by daycare personnel in the prevention of disease and/or recognition of sick children. Section III deals with the care of high-risk children, ranging from changing diapers to the role of polymorphonuclear cells in combating infection. Section IV is devoted to guidelines for the control of isolated and epidemic infections, first in a general way and then, by providing instructions for managing specific infections. A list of signs and symptoms for each illness to be given parents to assist in identifying illness in their child is provided. The content of the last section -- the largest at 219 pages -- is probably aimed at physicians and contains thumbnail sketches of fifty-three specific diseases.

Despite the impressive list of contributors, this book suffers from attempting to do too much. As a result, it seemed less than adequate to meet the needs of the large, diverse audience for which it is intended.

## MEDICAL MISCELLANY MEDICAL

### Med Chi's Second Annual Conference on Addiction and Physician Health

**D**rug-related tragedies crowd local and national news broadcasts. Drug problems afflict both sexes and all races, religions, and professions. As health care professionals, we bear responsibility for the health of our community, state, and nation. Yet, only thoroughly educated professionals can effectively treat addictive disorders.

To fulfill the educational needs of health care professionals, Med Chi's Physician Rehabilitation Committee and Committee on Alcoholism and Chemical Dependency are sponsoring the Second Annual Conference on Addiction and Physician Health on Saturday, November 16, 1991 at the Med Chi Faculty Building. Conference topics will include:

#### *Substance Abuse Topics*

- How to help patients stop smoking
- The role of the primary care physician in the treatment of chemical dependence
- Adolescent chemical dependence
- Assessment and treatment of alcoholism in various age groups

#### *Physician Health Topics*

- Primary impairment prevention for medical students
- The impaired physician
- Urine drug-testing for physicians and other health care providers

#### *Addictive Behaviors Other Than Substance Abuse*

- Sexual exploitation of patients and treatment of sexual addiction
- Utilizing a traditional addiction treatment approach in the treatment of eating disorders

Registration will be \$50 for Med Chi members, \$75 for nonmembers, and \$25 for residents, medical students, nurses and other health professionals. Registration fees include breakfast, lunch, and breaks. For registration information, please call Vivian Smith at (301)539-0872 or toll-free in Maryland at (800)492-1056. ■

Physicians filled the auditorium to capacity at the First Annual Conference on Addiction and Physician Health.

## AUTHOR INFORMATION AUTHOR

**M**anuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

### Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a WordPerfect or ASCII format.

Include full name of author(s) with highest degrees and academic or professional titles.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

An introductory synopsis of approximately 25 to 50 words is required.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the *Uniform Requirements for Manuscripts Submitted to Biomedical Journals* compiled by the International Committee on Medical Journal Editors (available through the *Annals of Internal Medicine*).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the principal author and *MMJ*. ■ ■ ■

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset. ■

Dear Carl,  
Congratulations on your new medical staff leadership position! Now you're not only a physician — you need to be a manager, negotiator, arbitrator, and even a parliamentarian. I wish I had received some special training when I first took a position like yours!

Sincerely,  
Helen

## Do you have the skills to do the job?

Chief-of-staff. Department chairman. Committee chair. Tough jobs, but somebody has to do them — sometimes even with no formal training and little leadership experience.

Now, through a new American Medical Association training program, you can sharpen the skills you need to face the challenges of leadership with confidence and authority.

### **Interactions: A Medical Staff Leadership Program**

This intensive day-and-a-half program will help sharpen your ability to:

- Resolve conflict among peers
- Negotiate with the board and administration
- Manage medical staff affairs
- Develop bylaws that enhance staff effectiveness
- Run meetings effectively and purposefully

### **Learn from the Experienced**

*Interactions* was developed by experts in medical staff leadership and field tested by more than 100 medical staff leaders nationwide. The faculty includes experienced physician leaders as well as management and legal experts. Program features lectures, discussions, and break-out sessions on all aspects of medical staff leadership.

### **Take the Challenge**

If you have recently been chosen for an important leadership position — chief of staff, department chairman, committee chair, or another key post — *Interactions* will develop the skills and confidence to succeed in your new role.

Choose the dates and location that are best for you.

# When you choose Princeton, you're in good company

“The Surgicenter was a new entity, and most insurers didn't know how to handle it. One wouldn't cover this procedure, the other wanted to exclude that one.

Princeton reviewed how we performed these procedures and then provided coverage for everything. They were flexible and willing to work with us so that we got the coverage we needed.”

---

*Dr. Lawrence Pinkner  
Plastic surgeon  
President, Surgicenter of Baltimore*

## It's A Closed Box.

Simply put, your Medical Mutual premiums go into a closed box . . . and you own the box. We pay claims, we pay to defend physicians, we pay operating expenses. Any money left over belongs to you. That's it. No money goes to out-of-state owners, no money goes to subsidize operating expenses of a parent company located in another state. Dividends are paid to you, not to outside stockholders.

The physicians of Maryland planned it this way when you asked the Maryland General Assembly to create Medical Mutual to meet your special insurance needs. It's a concept that has worked well for over 15 years, and it's a concept that has made Medical Mutual the choice of the vast majority of physicians across the state.

The closed box. We're the only ones who operate this way. Why accept anything less?

# At the SurgiCenter, we've found a way to relieve the most common discomfort of all.

Tired of the paperwork and red tape most hospitals put you through?

Then consider operating out of the SurgiCenter of Baltimore.

Thanks to the latest in state-of-the-art medical equipment, a supporting staff of the area's most caring and capable nurses and technicians, and a comfortable, intimate setting, we're able to fully meet your same-day surgical needs.

Without causing you or your patients any undue stress or discomfort.

And unlike high-traffic hospitals, we're committed to one thing

and one thing only — outpatient surgery. So we can operate more efficiently, and with less overhead. A point your patients are sure to appreciate come billing time.

We're also easy to get to. And we'll bend over backwards to make sure you have a room when you need it.

Plus, we have agreements with all the major insurance carriers and HMO's in the state.

So drop by for a tour. Any time. Or call 356-0300 for more information.

Find out why nearly 100 of the area's finest physicians and

surgeons are operating at the SurgiCenter of Baltimore.

And turn what used to be a complex and painful procedure into a breeze.

## Making the right choices means asking the right questions.

You know the questions to ask your patients. Questions that will provide the information you need to make an informed decision about medical treatment.

When it comes to choosing a medical malpractice insurer, knowing which questions to ask--and how to interpret the answers--is no less important. Because just as your treatment decisions may have lasting impact on your patient's long-term health, your choice of insurer may make all the difference to your professional and financial well-being in the years ahead.

In an uncertain medical situation, you might consult a specialist. When you're making decisions about insurance, why not consult with an insurance specialist? An expert who can suggest which

questions to ask, guide you through the technical jargon, and help you select the coverage that's right for you.

That's where Princeton's network of independent insurance agents comes in. Our agents understand the insurance needs of health care professionals. They'll show you how to compare costs and benefits, and help you avoid gaps or duplications in coverage.

Do ask an agent why Princeton should be your choice. Ask about our financial strength, about our claims management philosophy that vigorously defends physicians against meritless claims...and about our new office package policy that offers protection for your practice and premises. We think you'll like the answers.

## Maryland Medical Journal

OCTOBER 1991

VOLUME 40 NO 10

### ARTICLES

- The Maryland Lupus Foundation: A Commitment to Professional Education . . . 869**  
*Mary Betty Stevens MD*

- The History of Lupus Erythematosus . . . . . 871**  
*Marc C. Hochberg MD, MPH*

The history of lupus can be divided into the classical period which saw the description of the cutaneous disorder, the neoclassical period which saw the description of the systemic or disseminated manifestations of lupus, and the modern period which was heralded by the discovery of the lupus erythematosus cell in 1948.

- The Clinical Spectrum of SLE . . . . . 875**  
*Mary Betty Stevens MD*

Systemic lupus erythematosus is a complex immunologic disorder with an equally complex clinical presentation and course. In recent years, the earlier recognition of milder disease supported by immunologic markers coupled with means of intervention and suppression, as well as medical/surgical advances has resulted in increases in the quality of life and survival.

- Vascular Lesions in SLE . . . . . 887**  
*Thomas M. Zizic MD*

The confusing array of manifestations resulting from multisystem involvement in SLE is due, in part, to the widespread involvement of blood vessels.

- Autoantibodies and SLE . . . . . 901**  
*Carol M. Ziminski MD*

Systemic lupus erythematosus is characterized by an enormous and increasing array of antibodies to cellular constituents. These autoantibody phenomena are not diagnostic in themselves but must be interpreted within the context of the individual clinical situation.

- Variants/Subsets of SLE . . . . . 909**  
*Howard W. Hauptman MD*

Although systemic lupus erythematosus can be considered a single diagnostic entity, a number of clinical subsets have been described including late-onset lupus, drug-induced lupus, neonatal lupus, discoid lupus, and subacute cutaneous lupus.

- Management of the Pregnant Lupus Patient . . . . . 917**  
*John T. Repke MD and Michelle Petri MD, MPH*

Increased understanding of SLE as it relates to pregnancy has allowed for many women with lupus today to have a successful pregnancy. However, pregnancies are high risk with up to 25 percent ending in miscarriage and with a high frequency of preterm delivery.

## Medical Therapy for SLE . . . . . 923

David B. Hellmann MD

Today, the major therapeutic challenge in systemic lupus erythematosus is to preserve the gains provided by cor-  
ticosteroids while reducing their side effects.

## SLE: Management Overview . . . . . 935

Joan D. Sutton RN, MSN

Patients with systemic lupus erythematosus can often benefit  
from cooperative and collaborative interventions prescribed  
by both physicians and other arthritis health care profes-  
sionals.

Performing Arts Medicine: Issues in  
Diagnosis and Management

The Committee on Medicine and the Performing Arts will sponsor a continuing medical education conference, January 24-25, 1991, at the Med Chi Faculty Building in Baltimore. Tentatively titled, "Performing Arts Medicine: Issues in Diagnosis and Management," the conference will provide information for primary care physicians who see a few amateur performers, as well as for those specializing in the care of musicians and dancers. The conference will also include sessions of value to allied health care professionals and to performers themselves. In addition, registrants will be treated to a chamber music concert by students from Peabody Conservatory.

The plenary speaker will be Dr. Hunter Fry, an Australian expert in overuse injuries, who has shown continued interest in the growth of arts medicine in Maryland. Other topics to be covered include:

- the epidemiology of performing arts medicine,
- medical problems of young dancers,
- neurologic testing,
- performance anxiety,
- medicolegal issues,
- the role of the musician and special career demands, and
- physical therapy techniques.

Committee members John B. DeHoff MD, Emidio Bianco MD, Harold Bob MD, Scott Brown MD, Norman Rosen MD, Leo Rozmaryn MD, Charles Silberstein MD, Sandra Bishop, Ruth Drucker, and David Fetter will serve as speakers, moderators, and planners.

National Medical Musical Group

The Veterans Administration National Medical Musical Group (VA-NMMG) is a chorus and symphony orchestra made up of physicians and other health professionals from VA and non-VA medical centers around the country. The organization, which gave a highly acclaimed performance last December at DAR Constitution Hall in Washington, DC, is currently recruiting new members. If you are a good singer or play a musical instrument, and would be interested in participating in this year's benefit for homeless veterans on December 4, contact Debby Marshall at 202-667-3879 or write: VA-NMMG, 1700 17th Street, NW, Suite 508, Washington, DC 20009.

American Heart Association  
Offers Research Awards

The American Heart Association (AHA), Maryland Affiliate, is taking applications for research awards. The American Heart Association supports research projects related to the cardiovascular/cerebrovascular system, including basic science, clinical studies, epidemiology, risk factor identification and avoidance, lifestyle modification, and recognition of cardiovascular disease. Last year, the AHA devoted more than \$626,000 to fund thirty researchers in Maryland. For information on and applications for *Research Fellowships* (\$20,000 per year plus \$750 for travel and supplies), *Nutrition Research Awards* (\$25,000 per year plus fringe benefits), and *Grants-in-Aid* (\$20,000 per year plus 10 percent institutional overhead), call Margaret Prausnitz at 301-685-7074 or 1-800-432-7803. Submission deadline is November 1, 1991 -- no exceptions.

Doctor, Planning to Relocate?

# Family therapy for colic.

The excessive crying of colic puts a strain on the most loving family—and often on their physician as well. And whatever the cause of colic, one fact is clear:

## Gas is often part of the colic problem.

New Phazyme Drops contains simethicone, which can safely break up gas and bring baby relief. That's why it can help whenever colic is a problem.

## Significantly reduces crying of colicky infants.<sup>1</sup>

Double-blind, randomized, placebo-controlled study.

## Priced 25% below the leading brand.

This significant price advantage will be particularly important to parents, since they may be relying on Phazyme Drops for up to three months. And it's naturally flavored—something else they'll appreciate.

# Phazyme® Drops (simethicone/ antigas)

## Helps you through the colic phase.

## With Malpractice Insurance Premiums on the rise, why settle for anything less than the best available coverage?

The downward trend in malpractice insurance premiums has broken and prices are on their way back up. Should a physician choose between insurers only on price? Of course not. But there are a number of quality choices between carriers and products. You should get the most from your premium dollars.

Let us compare the available products and prices for you. There is no charge or obligation. For written quotations and comparisons call us or send us a copy of your malpractice policy. Let us show you why hundreds of Maryland physicians rely on us for their malpractice coverage. You need a broker you can rely on.

## Pelvic Inflammatory Disease (PID) Guidelines for Diagnosis and Treatment

### I. DIAGNOSIS

Clinical diagnosis of PID is difficult because of the wide variation in symptoms and signs among women with this condition. Many women with PID may exhibit subtle, vague, or mild symptoms that are not readily recognized as PID. This situation interferes with timely diagnosis, inhibits effective treatment, and contributes to inflammatory sequelae in the upper-reproductive tract. Laparoscopy can be used to obtain a more accurate diagnosis of salpingitis and a more complete bacteriologic diagnosis. However, this diagnostic tool is often neither readily available for acute cases nor easily justified when symptoms and signs are mild and/or vague. Moreover, laparoscopy will not detect endometritis and may not detect subtle inflammation of fallopian tubes. Consequently, the diagnosis of PID is often based on clinical findings supplemented with results of cultures or non-culture tests of samples obtained from the endocervix.

The clinical diagnosis of PID is imprecise. In published studies, when compared with laparoscopy as the standard, a clinical diagnosis of symptomatic PID has a predictive value positive of approximately two-thirds. No single historical, physical, or laboratory finding is both sensitive and specific for the diagnosis of PID (i.e., can be used both to detect all cases of PID and to exclude all women without PID). Combinations of diagnostic findings, which improve either sensitivity (detect more women who have PID) or specificity (exclude more women who do not have PID), have done so only at the expense of the other (i.e., requiring two or more findings will exclude more women without PID, but will also reduce the number of patients with PID who are detected).

Current evidence indicates that many episodes of PID are unrecognized. Although some women may have truly asymptomatic ("silent") PID, others go undiagnosed because they or their health-care providers fail to recognize the implications of mild or nonspecific symptoms

and/or signs. Because of the potential for damage to the reproductive health of women by even these apparently mild cases of PID, a "low threshold for diagnosis" of PID is recommended. The following recommendations for diagnosing PID are intended to help clinicians both recognize when PID should be suspected and gain additional information to increase their diagnostic certainty.

Treatment for PID should be instituted on the basis of these minimum clinical criteria for pelvic inflammation in the absence of competing diagnoses (e.g., positive pregnancy test, acute appendicitis).

---

#### Minimum Criteria for Clinical Diagnosis of PID

- Lower abdominal tenderness
  - Bilateral adnexal tenderness
  - Cervical motion tenderness
- 

Among women with severe clinical signs, more elaborate diagnostic evaluation is warranted because incorrect diagnosis and management may cause unnecessary morbidity. Thus, additional criteria should be used to increase the specificity of diagnosis. Routine criteria are those that are simple to assess; elaborate criteria are more definitive but are more expensive and often invasive.

---

#### Additional Criteria Useful in Diagnosing PID

##### Routine

- Oral temperature  $> 38.3^{\circ}\text{C}$
- Abnormal cervical or vaginal discharge
- Elevated erythrocyte sedimentation rate and/or C-reactive protein
- Culture or non-culture evidence of cervical infection with *N. gonorrhoeae* or *C. trachomatis*

## Elaborate

- Histopathologic evidence on endometrial biopsy
- Tubo-ovarian abscess on sonography
- Laparoscopy

---

Although not necessary to justify initial treatment decisions, bacteriologic diagnosis is helpful. It provides diagnostic confirmation (thereby improving management and reinforcing the need to treat sex partners) and serves as baseline for test-of-cure cultures.

---

## Tests Recommended for All Suspected Cases of PID

- Cervical cultures for *N. gonorrhoeae*
  - Cervical culture or non-culture test for *C. trachomatis*
- 

## OTHER IMPORTANT DIAGNOSTIC CONSIDERATIONS

The diagnostic approach outlined above reflects a growing concern that PID is often not diagnosed, especially among women with mild or atypical clinical signs. Although correcting this situation is a high public health priority, three qualifications regarding this more sensitive diagnostic approach must be noted.

First, the use of highly sensitive PID diagnostic criteria means that many women who do not have PID will be misdiagnosed and treated for PID (low specificity). Patients and their sex partners often have strong emotional reactions when faced with the implications of a diagnosis of STD. The health-care provider must, therefore, inform a patient of a diagnosis of PID carefully. Both the uncertainty of the diagnosis and the value of empiric treatment must be explained clearly.

Second, careful follow-up is necessary. If no clinical improvement has occurred at 48-72 hours, alternate diagnoses (e.g., appendicitis, endometriosis, ruptured ovarian cyst, or adnexal torsion) should be reconsidered. Use of alternate or additional antimicrobial therapy should also be considered.

Third, use of even these minimum clinical criteria may exclude some women with PID. Clinicians should not withhold therapy from a woman in whom they suspect PID because of failure to meet these criteria.

## II. TREATMENT

### A. Patient Education

The clinician's role as a health educator is central to effective management. Practitioners should explain to

women the nature of their disease and should encourage them to comply with therapy and prevention recommendations. Specifically, practitioners should:

- Emphasize the need for taking all the medication, regardless of symptoms.
- Review contraindications and potential side effects.
- Identify and discuss potential compliance problems.
- Review the medical purpose of follow-up evaluation.
- Emphasize the need to avoid sex until treatment is completed.
- Emphasize the need to refer sex partners for evaluation and treatment.

When medical-care messages are clear, explicit relevant, and rigorously delivered by providers, patients are likely to comply. Reinforcement of these messages can be achieved by providing written information. Information on written materials for patient distribution can be obtained from CDC or local and state health departments.

### B. Management of Sex Partners

**Treatment for sex partners of women with PID is imperative. The management of women with PID should be considered inadequate unless their sex partners have been appropriately evaluated and treated.** Failure to manage her sex partner(s) effectively places a woman at risk for recurring infection and related complications. Moreover, untreated sex partners often unknowingly transmit STD in a community because of asymptomatic infection.

In clinical settings in which only women are seen, special arrangements should be made to provide care for male sex partners of women with PID. When this is not feasible, clinicians should ensure that sex partners are referred for appropriate evaluation and treatment. After evaluation, sex partners should be empirically treated with regimens effective against *C. trachomatis* and *N. gonorrhoeae* infections.

### C. Hospitalization

The efficacy of outpatient management for preventing late sequelae remains uncertain. A single intramuscular (IM) injection of cefoxitin or ceftriaxone, even in conjunction with oral doxycycline for 10-14 days, will provide less complete antimicrobial coverage for a shorter duration than regimens recommended for inpatients. Theoretically, outpatient management could, therefore, reduce the likelihood of successful eradication of upper-genital-tract pathogens and potentially increase the likelihood of late sequelae. Currently, no data are available to adequately assess the risks, benefits, and costs of inpatient versus outpatient treatment for PID.

As for all serious intra-abdominal infections, hospitalization should be considered whenever possible, and is particularly recommended in the following situations:

- The diagnosis is uncertain.
- Surgical emergencies such as appendicitis and ectopic pregnancy cannot be excluded.
- A pelvic abscess is suspected.
- The patient is pregnant.
- The patient is an adolescent (adolescent patients' compliance with therapy is unpredictable, and the long-term sequelae of PID may be particularly severe for members of this group).
- Severe illness precludes outpatient management.
- The patient is unable to tolerate an outpatient regimen.
- The patient has failed to respond to outpatient therapy.
- Clinical follow-up within 72 hours of starting antibiotic treatment cannot be arranged.

Many experts recommend that all patients with PID be hospitalized so that treatment with parenteral antibiotics can be initiated.

#### D. Treatment Regimens

Although several antimicrobial regimens have been proven highly effective in achieving clinical cure, no single therapeutic regimen of choice exists for persons with PID, unlike treatment for many specific sexually transmitted organisms. PID is a complex syndrome that encompasses a broad spectrum of inflammatory diseases (e.g., endometritis, salpingitis, and tubo-ovarian abscess) that may be caused by a variety of organisms.

Guidelines for the treatment of patients with PID, therefore, have been designed to provide flexibility in therapeutic choices. PID therapy regimens are designed to provide broad-spectrum coverage of likely etiologic pathogens. In addition to considering microbial etiology, selection criteria for a treatment regimen should also include institutional availability, cost-control efforts, patient acceptance, and regional differences in antimicrobial susceptibility.

The treatment regimens that follow are recommendations, and the specific antibiotics named are examples. Treatments used for persons with PID will continue to be broad spectrum until more definitive studies are performed. **Any regimen used, however, should cover *C. trachomatis*, *N. gonorrhoeae*, anaerobes, gram-negative rods, and streptococci.**

##### 1. Inpatient treatment

One of the following:

---

#### Recommended Regimen A

- Cefoxitin 2 g intravenously (IV) every 6 hours or cefotetan IV 2 g every 12 hours (Other cephalosporins such as ceftizoxime, cefotaxime and ceftriaxone, which provide adequate gonococcal, other gram-negative aerobic and anaerobic coverage, may be utilized in appropriate doses.)

plus

- Doxycycline 100 mg orally or IV every 12 hours.
- 

The above regimen is given for at least 48 hours after the patient clinically improves. After discharge from hospital, doxycycline 100 mg orally 2 times a day should be continued for a total of 10-14 days.

---

#### Recommended Regimen B

- Clindamycin IV 900 mg every 8 hours

plus

- Gentamicin loading dose IV or IM (2 mg/kg of body weight) followed by a maintenance dose (1.5mg/kg) every 8 hours.
- 

The above regimen is given for at least 48 hours after the patient improves. After discharge from hospital, doxycycline 100 mg orally 2 times a day should be continued for 10-14 days total. Continuation of clindamycin 450 mg orally 4 times a day for 10-14 days may be considered as an alternative.

Continuation of medication after hospital discharge is important, particularly for the treatment of persons who may have *C. trachomatis* infection. Clindamycin has more complete anaerobic coverage than doxycycline. Although preliminary data suggest that clindamycin is effective against *C. trachomatis* infection, doxycycline remains the treatment of choice for patients with chlamydial disease. Thus, when *C. trachomatis* is strongly suspected as an etiologic agent, doxycycline is the preferred alternative. In such instances, doxycycline therapy may be started while the patient is hospitalized if initiating therapy before hospital discharge is likely to improve the patient's compliance.

#### Rationale

Clinicians have extensive experience with both the cefoxitin/doxycycline and clindamycin/aminoglycoside combinations. Each of these regimens provides broad coverage against polymicrobial infection and has been shown in numerous studies to be highly effective in achieving clinical cures. However, data are lacking on the efficacy of these regimens, as well as other regimens,

in preventing late sequelae. Cefotetan has properties similar to those of cefoxitin and requires less frequent dosing. Clinical data are limited on other third-generation cephalosporins (ceftizoxime, cefotaxime, ceftriaxone), to replace cefoxitin or cefotetan, although many authorities believe they are effective. Doxycycline administered orally has bioavailability similar to that of IV formulation and may be given if normal gastrointestinal function is present.

Experimental studies suggest that aminoglycosides may not be optimal treatment for patients who have gram-negative organisms within abscesses, but clinical studies suggest that they are highly effective in treating persons for abscesses when administered in combination with clindamycin. Short courses of aminoglycosides are given to healthy young women when serum-level monitoring is usually not required.

## 2. Outpatient management

---

### Recommended regimen

- Cefoxitin 2 g IM plus probenecid, 1 g orally, concurrently or ceftriaxone 250 mg IM or equivalent cephalosporin

plus

- Doxycycline 100 mg orally 2 times a day for 10-14 days or tetracycline 500 mg orally 4 times a day for 10-14 days.
- 

---

### Alternative Regimen for Patients Who Do Not Tolerate Doxycycline/tetracycline (no data are available on this regimen)

- Substitute erythromycin 500 mg orally 4 times a day for 10-14 days.
- 

### Rationale

These empiric regimens provide broad-spectrum coverage against the common etiologic agents of PID. Notably, these regimens were particularly designed to

treat persons with chlamydial and gonococcal infections; few data are available on the efficacy of these regimens for treating persons with PID, particularly non-chlamydial/nongonococcal PID. Parenteral Beta-lactam antibiotics are recommended in all cases. The cephalosporins are effective in treating persons with gram-negative organisms, including enteric rods, anaerobic organisms, and gonococci. Although decreased susceptibility of gonococci to cefoxitin has recently been noted, clinically evident treatment failure has not been a problem. Patients who do not respond to therapy within 72 hours should be hospitalized for parenteral therapy. Doxycycline provides definitive therapy for chlamydial infections. Patients treated on an outpatient basis need to be monitored closely and reevaluated in 72 hours.

### E. Management of HIV-Infected Women

Although the precise etiologic relation between HIV infection and the risk of PID is uncharacterized-since HIV infection is sexually transmitted and PID is often caused by sexually transmitted pathogens-these two conditions often coexist. The management of coexistent HIV infection and PID is becoming an increasingly important concern. Differences in the clinical manifestations of PID among HIV-infected women have not been clearly described. However, PID among women immunocompromised for any reason may be more clinically severe and more refractory to medical management than PID among women with normal host defenses. It is reasonable to expect, therefore, that those HIV-infected women who are immunocompromised may be at increased risk for a complicated clinical course. In one study, HIV-infected women with PID were less likely than HIV-negative women with PID to have an elevated white-blood-cell count, but were more likely to have tubo-ovarian abscesses and to require operative intervention. HIV-infected women who develop PID should be followed closely with early hospitalization and IV therapy with a recommended antibiotic regimen, if possible.

## New EIS Officer, Dr. Betsy Thompson, Assigned to Maryland

Betsy L. Thompson, M.D., M.S.P.H. has been assigned by the Centers for Disease Control (CDC) as the Epidemic Intelligence Service (EIS) Officer for the state of Maryland for the next two years. Dr. Thompson completed her undergraduate training at St. Lawrence University and then worked in the Peace Corps for two years, first assigned to Liberia and then to Guatemala. She received her M.D. and her Masters of Science in Public Health at the University of Colorado and completed her residency in Internal Medicine--Primary Care at the University of California, San Francisco. She joined the Maryland Department of Health and Mental Hygiene, Epidemiology and Disease Control Program in July. During her CDC "field experience" in Maryland, she will focus on communicable disease epidemiology, but hopes also to become involved in injury epidemiology and chronic disease projects as well. She can be reached at (301) 225-6677.

Fifth Annual Postgraduate Program

## Core Content of Emergency Medicine: A Comprehensive Review

October 24, 1991 – October 30, 1991

Baltimore, Maryland

This seven-day program is **designed to review and reinforce your organization and comprehension of the essentials of Emergency Medicine**. Through a variety of educational experiences designed to complement most learning styles, our course provides many opportunities for self-assessment, review, and critical appraisal of the twenty-three core content areas of Emergency Medicine. The Core Content of Emergency Medicine was developed jointly by the American Board of Emergency Medicine (ABEM) and the American College of Emergency Physicians (ACEP). **We are the only national course that systematically reviews all content areas.**

This course is **recommended for the established physician in practice, the physician who has recently completed an Emergency Medicine residency training program, and second or third year residents currently in Emergency Medicine training programs**. Historically, the **majority of our registrants** have chosen our program as they near completion of a self-directed plan of study in **preparation for the written initial certifying or recertification examinations** offered by ABEM. Our course facilitates this final preparative process. Many other registrants choose our program as an annual "refresher course."

We continue to be gratified with the feedback provided by prior registrants and course faculty. Last year we field-tested the concept of providing multiple choice questions on computers in a program designed specifically for this course. Also, we presented our information in a format that correlated with the organization of the text *Emergency Medicine: A Comprehensive Study Guide* – ACEP, edited by Tintinalli, Krome, Ruiz. These new elements were very well received. We have retained this organizational format for 1991, and we have fully **incorporated the computer lab into our 1991 course**. **Special test-taking strategies sessions** were very well received last year and will be expanded for 1991. We will meet the specific needs of initial certify and the written recertification candidates.

Major changes in the organization of our program for 1991 include: course location close to airport, the availability of **a radiologist each evening for formal review of the daily films**, structured **discussion of PEER IV questions and answers**, showing of **videos of selected lectures in the Marriott guest rooms** for three hours each evening, and inclusion of **lunches** in the registration fee.

### COURSE OBJECTIVES AND FORMAT

The **educational objectives** of our program are to enable registrants to:

- Review and reinforce your organization and comprehension of the essentials of the core curriculum in Emergency Medicine
- Refine your test-taking skills
- Enhance your clinical skills
- Provide improved patient care

The **instructional resources** which are a part of the program include:

- **Faculty** from community and academic practices from around the country who have a keen interest and skill in teaching. **All course faculty have taken the ABEM written examination**. Faculty have been given the specific program objectives and guidelines for the preparation of their syllabus and lecture material. **They understand that many of our registrants are only days away from the actual written examination.**
- **Detailed course 'syllabus'** which is sent to you in advance. Each speaker has prepared a syllabus – in two parts. The first part is a comprehensive clinical review inclusive of pertinent clinical pathophysiology. This text is in modified outline form. The faculty have been asked to have their lectures follow the sequences of their syllabus as much as possible. The second section of the syllabus is entitled **"The Essentials."** This is a simplified listing of facts and concepts, and has been particularly helpful for personal review purposes just prior to the exam or as a reference in the emergency department. Each syllabus is edited by the program director to provide you with a "user friendly" document.
- The **didactic** portion of our program which will provide you with approximately 60 lectures. **Allocation of lecture time for the specific topics in each section has been determined by the**

**relative weight of the content areas as delineated by the American Board of Emergency Medicine** for written exam purposes. Lecture scheduling has been done with attention to the need of registrants for ample breaks and avoidance of fatigue.

- **Pretests** prior to each half day session. Answers are discussed during the faculty panel held at the end of each half day session.
- The **self-teaching laboratory**. Electrocardiograms, a variety of pictorials and other pertinent clinical material will be available for individual and group interactive study. Most of this information is presented in problem/case format to facilitate your retention.
- **Computer lab with 1500 single answer multiple choice questions** will be available for use throughout the course.
- **X-ray view boxes** will display 23 problem-based radiographic cases daily.
- **"Meet the Radiologist"** sessions will be available for one hour each evening to review the daily x-ray cases.
- **Challenge x-ray cases** to be discussed in a special session led by Thomas Keats, M.D., author of the textbook, *"Emergency Radiology."*
- **Review of PEER IV questions**. The 350 questions will be discussed with a focus on question construction and answer rationale. PEER IV books can be purchased on site at the same rate as available directly from ACEP.
- **Specific test-taking strategies** for oral and written boards will be presented by Carol Rivers, M.D., FACEP, founder and president of Emergency Medicine Educational Enterprises.
- **Interaction with faculty** will be available during lunches and evening workshops for case discussion and informal questions and answers.

Register Today — Enrollment is limited

**FOR FURTHER INFORMATION:** Conference Coordinator, Office of Continuing Education, Johns Hopkins Medical Institutions, Turner 20, 720 Rutland Avenue, Baltimore, Maryland 21205-2195 — (301) 955-2959.

A man is shown in profile, looking down and slightly to the right. He is wearing a dark shirt. The lighting is dramatic, with a strong red light source from the left and a blue light source from the bottom left, creating a high-contrast, moody atmosphere. The background is dark and indistinct.

## The Connection

The present, the future.  
A life. Changed by the diagnosis of HIV.

Caremark offers medical services to help deal with these changes. At home, or at our Caremark Connection center.

The Caremark Connection offers HIV treatment in a convenient, comfortable, private neighborhood center – medical therapies, nursing, pharmacy, connection with community services. And always respect and understanding.

Our highly trained staff includes HIV nurse specialists, clinical pharmacists, registered dietitians, and reimbursement coordinators, allowing us to administer many complex therapies, such as:

- Pentamidine (IV/Aerosol)
- Ganciclovir
- Amphotericin-B
- Fluconazole
- Acyclovir
- Blood Transfusions
- Enteral Nutritional Supplements
- Total Parental Nutrition (TPN)
- Antibiotics
- Analgesics
- Investigational Drugs

The Connection offers scheduling flexibility, privacy and convenience for prophylactic and chronic therapies. We provide the opportunity for patient networking and information, nutritional counseling and assessment, reimbursement counseling, and a nationwide service for travelers.

**Caremark Connection**  
1039 N. Calvert Street

# Executive Director's Newsletter

October 1991

---

## Erratum

---

The September issue of the *Executive Director's Newsletter (EDN)* contained an inadvertent typographical error in the "Medicare Fee Schedule" section. In the second letter from Marvin Schneider MD to Health Care Financing Administration Administrator Gail Wilensky PhD, an error not contained in the actual letter sent to Dr. Wilensky occurred. The actual letter sent read (correction in bold): "While I previously stated that it was **unrealistic** to think that the interpretation of EKGs requires little expertise, I want to ensure the clarity with which this comment was made." Med Chi regrets any confusion this misprint may have caused.

---

## Med Chi Position on Mandatory Testing

---

In August, Med Chi issued a press release reaffirming its position to oppose mandatory HIV testing for both health care workers and patients. The release was developed in response to an announcement by Governor Schaefer that he intends to pursue mandatory HIV testing for health care workers and patients. Citing lack of scientific evidence for the need to test health care workers as well as the exorbitant increase in health care costs that would result from testing health care workers and patients, the news release attempts to quell unfounded public fears of HIV transmission from physician to patient. As a result of the release, the following Maryland newspapers, radio and television stations featured stories on Med Chi's position:

### Newspapers

*The Baltimore Sun*, Baltimore  
*Daily Banner*, Cambridge  
*Harford Post*, Bel Air  
*Montgomery Sentinel*, Gaithersburg  
*News*, Hancock,  
*Prince George's Journal*, Lanham  
*Prince George's Sentinel*, Rockville  
*Sentinel*, Hyattsville  
*Star Democrat*, Easton

### Radio Stations

WBAL-AM, Baltimore  
WFMD-AM, Frederick  
WGRX-FM, Baltimore  
WHUR-FM, Washington  
WMAL-AM, Washington

### Television

WBAL-TV, Baltimore  
WJZ-TV, Baltimore

The release also mentioned Med Chi's efforts to develop a practice protocol for physicians with HBV/HIV. At press time, Med Chi's House of Delegates was scheduled to vote on the draft protocol on September 14, 1991. Pending Med Chi's approval, the protocol is scheduled to be presented to the Maryland Legislature on December 2, 1991 in accordance with H.B. 124 passed by the 1991 Maryland General Assembly.

Because of the possibility that legislation may be introduced in January 1992 that would mandate HIV testing for health care workers, all Med Chi physicians are encouraged to contact their Maryland legislators now and encourage them to vote against mandatory HIV testing. For a copy of the release, news clippings, or Med Chi's protocol for physicians with HIV, contact Betsy Newman, Public Relations Director at 301-539-0872 or 1-800-492-1056.

---

## Medicare Reimbursement

---

Because of enormous input from physicians, the Bush Administration recently announced that it will revise the Medicare Fee Schedule published in the July 29, 1991 *Federal Register* to soften the proposed reductions in Medicare reimbursements that would have cut millions of dollars in

Medicare payments to physicians. The new fee schedule, known as the Resource-Based Relative Value Scale (RBRVS), was intended to more equitably balance payments to undervalued services from those labeled by the RBRVS as over-valued services. The fee schedule, which was to be budget neutral, would have actually reduced physician payments by 16 percent thereby reducing overall payments by some eight billion dollars or more by 1996. Med Chi wishes to thank all the physicians who wrote to the Health Care Financing Administration (HCFA) and their US Representatives encouraging HCFA to reevaluate the new regulations. Med Chi intends to obtain a copy of the administration's new schedule and distribute it to component medical societies as soon as possible. For more information about the Medicare regulations, contact Roseanne M. Matricianni, Assistant Executive Director for Health Care Policy at 301-539-0872 or 1-800-492-1056.

---

### *Medicare Fraud*

---

The following message is provided by Maurice Hartman, Regional Administrator to the Health Care Financing Administration (HCFA), in an effort to improve communications about a Medicare fraud alert on waiver of coinsurance:

Physicians recently received a carrier Medicare bulletin which included a Fraud Alert concerning the waiver to Medicare deductibles and coinsurance. This alert, from the Inspector General's Office of the Department of Health and Human Services, indicated that the routine waiver of Medicare patient liability by physicians and suppliers of medical equipment and services may violate federal anti-kickback and false claim laws. The vast majority of physicians need not worry about occasionally deciding not to press for patient payment of the deductible or coinsurance if that decision is based on the patient's financial condition. In such cases, to avoid any question of a violation of the Medicare statute, physicians can follow a few simple principles.

1. Do not advertise your practice as one that routinely accepts the Medicare allowance as payment in full for services performed.
2. Provide each patient with a bill and attempt to collect coinsurance from the patient or third party payor.
3. Do not charge Medicare patients higher amounts than other patients.
4. If you waive the coinsurance or deductible in an individual case, make sure your action is based on the patient's financial condition.

It is not required that physicians make extraordinary attempts to collect from the patient. In those cases where a bill has been issued but the cost of continuing collection efforts could exceed or be disproportionate to the amount to be collected from a particular patient, the physician need not continue to press the patient. To be considered a reasonable collection effort, the effort to collect Medicare coinsurance and deductible amounts must be similar to that made to collect comparable amounts from non-Medicare patients.

Physicians who follow the above principles should not have a problem with violation of the federal anti-fraud rules.

---

### *Medicaid Provider Fee Project*

---

In August, the Bush Administration announced its intention to design regulations that would prevent Maryland (and other states) from implementing variations of a Medicaid Provider Fee Project (PFP). Med Chi will publish an update of the new federal regulations as soon as they are available. For questions regarding the PFP, contact Roseanne M. Matricianni, Assistant Executive Director for Health Care Policy, at 301-539-0872 or 1-800-492-1056.

---

## Physician Licensure Fees

---

The proposal to permanently increase physician licensure fees is expected to be published in a September issue of the *Maryland Register*. All Maryland physicians are encouraged to write to the Board of Physician Quality Assurance (BPQA) and formally express their concern regarding the drastic increase in licensure fees. The address of the BPQA is: Board of Physician Quality Assurance, P.O. Box 2571, Baltimore, MD 21215-0095.

---

## Safe Harbor Regulations

---

In the July 29, 1991 *Federal Register*, the Department of Health and Human Services published the final "safe harbor" regulations. These regulations, intended to define business arrangements and payment practices for physicians participating in Medicare and Medicaid, established ten safe harbors. Because these regulations went into effect immediately, Med Chi urges all physician to comply with the law. To help physicians understand these regulations, there will be an "Emergency Conference on the Safe Harbors: How to Structure Health Care Joint Ventures Under the Law" on October 11, 1991 from 9:30 am to 4:30 pm at the Columbia Inn, located at 10207 Wincopin Circle in Columbia, Maryland. Directions: I-95 to 175 West. After passing Route 29, go through five traffic lights. After the fifth light, turn left onto Wincopin Circle.

In addition to the conference, the fall issue of the *Physician's Practice Digest* will feature an article that provides more detailed information on these regulations. This issue is scheduled to be mailed on or about October 15, 1991. For questions concerning the safe harbors, contact Med Chi's Legal Department at 301-539-0872 or 1-800-492-1056. For a copy of the article, contact Med Chi's Communications Department at 301-539-0872.

---

## Physician Disclosure of Ownership of Health Care Services

---

Physicians are reminded that, effective July 1, 1991, Maryland law requires physicians to post a notice in their office(s) regarding ownership of health care services to which they refer patients. A disclosure of ownership sign was featured in the September issue of the *MMJ*. For additional copies of this sign, contact Med Chi's Communications Department at 301-539-0872 or 1-800-492-1056.

---

## President's Regional Conferences

---

The **President's Regional Conference in western Maryland** will be held on Thursday, October 3, 1991 at 4:30 p.m. at the Sheraton Inn in Hagerstown. The conference will update Maryland physicians on important Med Chi issues including liability insurance and the AMA's Health Access America. Physicians will also have an opportunity to earn continuing medical education credits through a presentation on "Panic Disorder or Coronary Artery Disease?"

The **President's Regional Conference on the eastern shore** is scheduled for November 14, 1991 at 4:30 pm at the Cambridge Yacht in Cambridge. The President's Regional Conference for southern Maryland is scheduled for March 12, 1991. Watch the Executive Director's Newsletter for more information about these conferences or contact Norbert Picha, Med Chi Deputy Executive Director, at 301-539-0872 or 1-800-492-1056.

---

## Drug Conference

---

Med Chi's "Second Annual Conference on Addiction: Prevention, Recognition and Treatment" will be held on Saturday, November 16, 1991 in the Med Chi Faculty Building. The conference will help physicians care for patients with addiction problems and fulfills seven continuing medical education credits. The first 150 registrants to the conference will receive a

free copy of the 1990 addiction conference monograph. A program and a registration form for this conference follow this newsletter.

---

### *Japanese Visit*

---

On October 15, 1991, a delegation of Japanese physicians will visit Med Chi to exchange information on "Health Care of the Elderly in the U.S. and Japan." The physician delegation is part of a group of more than 130 Japanese representatives from the Kanagawa Prefecture. For more information about the visit, see the article on pages 865-865 of this *MMJ*.

---

### *Doctor/Lawyer/ Teacher Partnership*

---

Physicians in Harford County and Baltimore City are needed to spend a few hours of their time to help prevent drug abuse among Maryland's children. As a physician volunteer in the Doctor/Lawyer/Teacher Partnership Against Drugs you will visit a classroom of students in your area to discuss medical dangers of using drugs. Your lawyer partner will emphasize the legal consequences of drug use. To volunteer or for more information, contact Betsy Newman, Public Relations Director, at 301-539-0872.

---

### *Awards Announced at Semiannual Meeting*

---

During the House of Delegates session at the 1991 Semiannual meeting Med Chi announced that "Venomous Snakebites" by Barry S. Gold MD and Robert A. Barish MD won the 1990 *Maryland Medical Journal* best article award. Med Chi also announced the following winners of the 1991 Medical Awards for Excellence in Medical Journalism:

#### **Daily Newspaper Category**

"AIDS: 10 Years Later," by Sue Miller, *The Evening Sun*

#### **Non-Daily Newspaper Category**

"The Wounded Healer," by Hollis Paschen, *The Columbia Flyer*

#### **Radio Category**

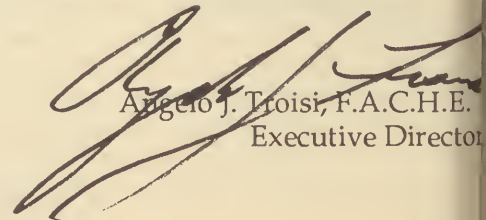

"The Cancer Nobody Talks About," by Merrie Street, WPOC-FM

---

### *Annual Meeting*

---

Mark your calendars! Med Chi's 1992 Annual meeting will be held Thursday-Saturday, April 30-May 1 at the Omni International Hotel in Baltimore. Watch the Executive Director's Newsletter for more meeting and program information.

Angelo J. Troisi, F.A.C.H.E.  
Executive Director

The following letter from Nelson Sabatini, Secretary, Department of Health and Mental Hygiene, was sent to all Maryland physicians in the August, 1991 Communicable Disease Bulletin. The Medical and Chirurgical Faculty of Maryland is pleased to support the efforts of Governor Schaefer and the Department of Health and Mental Hygiene in making Maryland "Measles-Free." We encourage the cooperation of all health care providers to appropriately immunize their patients and to assure the immunity of the staff in their health care facilities.

## Measles-Free Maryland

Dear Doctor,

I would like to call to your attention that Governor William Donald Schaefer has been concerned about the resurgence of measles in Maryland over the past three years. He has directed the Maryland Department of Health and Mental Hygiene to plan a campaign to help stop this vaccine preventable disease.

Governor Schaefer's campaign for a **Measles-Free Maryland** will begin the week of September 21-27, 1991. The timing has been chosen to coincide with the National Immunization Week being sponsored by the Children's Action Network and the American Academy of Pediatrics. Their theme, which will be echoed in Maryland, will be "Before it's too late: Vaccinate!" An outline of the Governor's Campaign is as follows:

### Problem:

- » Between January, 1989, and July, 1991, 493 cases of measles were reported in Maryland. Approximately 30% of people with measles were hospitalized.
- » Unvaccinated preschoolers, teen-age school children (who had had one dose of measles vaccine) and young adult health care workers were hit the hardest. Health care facilities became sites of measles transmission.

### Messages to Parents:

- » All preschoolers should get their first dose of measles vaccine (as MMR) at 15 months of age.
- » All school-age children should get a second dose of measles vaccine (as MMR) either at entry to kindergarten, or at entry to middle school (10-12 years old). This recommendation for a second dose at kindergarten entry is new in Maryland--we hope to speed the process of immunizing all school-age children. Parents should have their child's school record updated to reflect receipt of the second dose.
- » All college enterers should get a second dose unless they have received a second dose earlier.

### Messages to Health Care Workers:

- » Give age-appropriate vaccination to all children.
- » Remove barriers to vaccination by: increasing hours of availability; having walk-in immunization clinics; offering vaccines at cost; omitting a pre-vaccination physical exam, etc.
- » Recall children ready to enter middle school for their second dose.
- » Ensure that health care facilities do not serve as sites for measles transmission by appropriate isolation and triage, and assuring measles immunity of all employee and volunteer health care workers.

### Timing:

- » September 21-27, 1991; September 23, 1991 kick-off, and activities following.

### Activities:

- » Press release and press conference; mailings; extended hours of clinics at local health departments, etc.

### Associated Activities:

- » Regulations are being written in conjunction with the Medical and Chirurgical Faculty's Subcommittee on Immunization and Infectious Disease that, as proposed, will require a second dose of measles vaccine for those students entering kindergarten and those entering sixth grade in the fall of 1992.
- » Regulations are being written to require measles immunity for each new employee and volunteer working 20 hours or more per week in Maryland hospitals.

You are invited to work together with the Department of Health and Mental Hygiene and all of Maryland's health care providers and citizens to **Make Maryland Measles-Free !**

Sincerely,

  
Nelson Sabatini  
Secretary

Saturday, November 16, 1991  
Med Chi Faculty Building, 1211 Cathedral Street, Baltimore, MD 21201

## Program

- 8:00 a.m. – 8:45 a.m. **REGISTRATION/CHECK-IN**  
(continental breakfast)
- 8:45 a.m. – 9:00 a.m. **OVERVIEW**
- 9:00 a.m. – 10:00 a.m. **THE ROLE OF THE PRIMARY CARE PHYSICIAN IN THE TREATMENT OF CHEMICAL DEPENDENCE** *Dan H. McDougal, M.D.*, Med Chi Physician Rehabilitation Committee
- 10:00 a.m. – 11:00 a.m. **ASSESSMENT AND TREATMENT OF ALCOHOLISM IN DIFFERENT AGE GROUPS** *Franklin T. Evans, M.D.*, Chair, Med Chi Committee on Alcoholism and Chemical Dependency
- 11:00 a.m. – 11:15 a.m. **BREAK**
- 11:15 a.m. – 12:15 p.m. **CONCURRENT SESSIONS**  
Session A: **SEXUAL EXPLOITATION OF PATIENTS: EVALUATION AND TREATMENT OF SEXUAL ADDICTION** *Richard Irons, M.D.*, Medical Coordinator, Professional Assessment Program, Golden Valley Treatment Center, Golden Valley, Minnesota  
Session B: **ASSESSMENT OF ADOLESCENT CHEMICAL DEPENDENCY** *Rev. Edward Reading, M.Div.*, NCAC II, Assistant Director, Physicians' Health Program, Medical Society of New Jersey  
Session C: **PREVENTING PHYSICIAN IMPAIRMENT** *Susan Kalia, M.D., M.P.H.*, Director, University Health Services, The Johns Hopkins University School of Medicine
- 12:15 p.m. – 1:30 p.m. **LUNCH**
- 1:30 p.m. – 2:30 p.m. **THE IMPAIRED PHYSICIAN** *Penelope Zeigler, M.D.*, Medical Director, Pennsylvania Medical Society Physician Health Program
- 2:30 p.m. – 3:30 p.m. **CONCURRENT SESSIONS**  
Session A: **DRUG TESTING FOR PHYSICIANS AND OTHER HEALTH PROVIDERS** *Stanley R. Platman, M.D.*, Vice-President Medical Affairs and Chief of Psychiatry, Homewood Hospital Center; Chair, Med Chi Physician Rehabilitation Committee  
Session B: **THE HIV POSITIVE PHYSICIAN** *Fred C. Gill, M.D.*, Chair, Med chi Committee on AIDS and *John Bartlett, M.D.*, Vice-Chair, Med Chi Committee on AIDS  
Session C: **UTILIZING A TRADITIONAL ADDICTION TREATMENT APPROACH IN THE TREATMENT OF EATING DISORDERS** *Townsend Pennington, M.D.*, Medical Director, The Willough at Naples, Naples, Florida
- 3:30 p.m. – 3:45 p.m. **BREAK**
- 3:45 p.m. – 5:45 p.m. **HOW TO HELP YOUR PATIENTS STOP SMOKING** *Kevin Ferentz, M.D.* Assistant Professor, Department of Family Medicine, University of Maryland School of Medicine, and *Carmine Valente, Ph.D.*, Deputy Executive Director, Medical and Chirurgical Faculty of Maryland

**For more information call Vivian Smith at (301)539-0872 or 1-800-492-1056.**

## Japanese Physician Delegation to Visit Maryland

On October 14-18, the Governor of Kanagawa, Japan, Kazuji Nagasu, will lead a delegation of more than 130 Japanese representatives to Maryland to visit professional and business associations. Among the delegation will be a group of twenty-five physicians and health care representatives from the public health department of the Kanagawa Prefectural Government and the Kanagawa Prefectural Medical, Dental, and Pharmacists Associations. The physician delegation will visit Med Chi on Tuesday, October 15, 1991 to learn about the organization and management of Med Chi, to include acquisition of medical licenses, medical insurance systems, and emergency medical systems.

(Left to right) Muraji Nakazawa, Kanagawa Medical Association President Ryohei Kawaguchi MD, Hiroshi Nakazawa MD, and Kanagawa Prefecture Medical Study Group President Hirotake Komiya

(Left to right) Maryland Governor William Donald Schaefer, Hiroshi Nakazawa MD, and Kanagawa Governor Kazuji Nagasu

The theme for this year's delegation is "Health Care of the Elderly in the US and Japan" and will focus on several economic and medical aspects of caring for senior citizens. During their visit, Japanese representatives will attend a number of meetings designed to address housing, health care, and educational and service needs of the elderly. Japanese physicians are scheduled to visit The Johns Hopkins University School of Medicine Geriatric Center, the National Institutes of Health - Center for Aging, and the University of Maryland.

This year marks the tenth anniversary of Maryland's sister state relationship with Kanagawa Prefecture, Japan, which is located just south of Tokyo. Since 1980, the Prefecture has sponsored the visit of a

medical services study group to various institutions in the US to study their medical systems, meet with physicians and other medical professionals, and promote goodwill within the medical community.

As part of the tenth anniversary celebration, Maryland Governor William Donald Schaefer led a delegation to Kanagawa in June 1991. Med Chi's Public Relations Committee Chairman, Hiroshi Nakazawa MD, a member of Maryland's Kanagawa Sister State Committee, traveled with the Maryland delegation as its physician representative. During the visit, Dr. Nakazawa met with President of the Japan Medical Association, Haruto Haneda MD, and the President of the Kanagawa Medical Association, Ryohei Kawaguchi MD, as well as several Kanagawa Medical Association Board members. These physicians will be part of the Japanese Delegation visiting Maryland in October.

(Left to right) Hiroshi Nakazawa MD presents a Maryland flag to Japan Medical Association President Haruto Haneda MD

Their main interests include home health care, medical waste management, physician quality assurance, and medical liability insurance.

For excellent response in the treatment of  
duodenal ulcers...

# **AXID**<sup>®</sup> nizatidine has the right answers

- Rapid epigastric pain relief<sup>1,2\*</sup>
- Fast and effective ulcer healing<sup>2,3,4</sup>

**AXID**  
**PASSES THE ACID TEST**

\*Most patients experience pain relief with the first dose.  
See adjacent page for references and brief summary  
of prescribing information.

## AXID® (nizatidine capsules)

**Brief Summary:** Consult the package insert for complete prescribing information.  
**Indications and Usage:** 1. Active duodenal ulcer—for up to 8 weeks of treatment. Most patients heal within 4 weeks.

2. Maintenance therapy—for healed duodenal ulcer patients at a reduced dosage of 150 mg h.s. The consequences of therapy with Axid for longer than 1 year are not known.

**Contraindications:** Known hypersensitivity to the drug. Because cross sensitivity in this class of compounds has been observed, H<sub>2</sub>-receptor antagonists, including Axid, should not be administered to patients with a history of hypersensitivity to other H<sub>2</sub>-receptor antagonists.

**Precautions:** General—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.  
3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of Axid is similar to that in normal subjects.

**Laboratory Tests:** False-positive tests for urobilinogen with Multistix® may occur during therapy.

**Drug Interactions:** No interactions have been observed with theophylline, chlorazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

**Carcinogenesis, Mutagenesis, Impairment of Fertility:** A 2-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a 2-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a 2-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

**Pregnancy—Teratogenic Effects—Pregnancy Category C:** Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in 1 fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in 1 fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

**Nursing Mothers:** Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

**Pediatric Use:** Safety and effectiveness in children have not been established.

**Use in Elderly Patients:** Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

**Adverse Reactions:** Clinical trials of varying durations included almost 5,000 patients. Among the more common adverse events in domestic placebo-controlled trials of over 1,900 nizatidine patients and over 1,300 on placebo, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common with nizatidine. It was not possible to determine whether a variety of less common events were due to the drug.

**Hepatic:** Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to 3 times the upper limit of normal, however, did not significantly differ from that in placebo patients. All abnormalities were reversible after discontinuation of Axid. Since market introduction, hepatitis and jaundice have been reported. Rare cases of cholestatic or mixed hepatocellular and cholestatic injury with jaundice have been reported with reversal of the abnormalities after discontinuation of Axid.

**Cardiovascular:** In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in 2 individuals administered Axid and in 3 untreated subjects.

**CNS:** Rare cases of reversible mental confusion have been reported.

**Endocrine:** Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to nizatidine. Impotence and decreased libido were reported with equal frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

**Hematologic:** Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H<sub>2</sub>-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

**Integumentary:** Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

**Hypersensitivity:** As with other H<sub>2</sub>-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

**Other:** Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

**Overdose:** Overdoses of Axid have been reported rarely. If overdose occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis does not substantially increase clearance of nizatidine due to its large volume of distribution.

# Maryland's newest physical rehab center already has 20 years experience.

Baltimore is a city known internationally for its outstanding medical care. Now the tradition continues with the addition of the new Maryland General-Bryn Mawr Rehab Center at Maryland General Hospital. This specialty center for physical medicine and rehabilitation offers Bryn Mawr Rehab's 20 years of experience and leadership in the field of rehabilitation medicine.

The partnership between Maryland General Hospital and Bryn Mawr Rehab is truly unique. For the first time in Maryland, two high quality institutions with long histories of health care achievement are coming together to make a major commitment to rehabilitation medicine.

The Maryland General-Bryn Mawr Rehab Center, the region's most modern and conveniently located rehabilitation facility, provides a continuum of care in physical and cognitive rehabilitation services

including brain injury, stroke, orthopedics, arthritis, amputee services and multiple sclerosis, among others.

Most importantly, everyone on the Maryland General-Bryn Mawr Rehab team is personally and professionally dedicated to helping patients reach their highest level of independence. Our guiding philosophy is team-centered care, focused upon the individual needs of our patients and their families. This is what makes Maryland General-Bryn Mawr Rehab Center a very special place for rehabilitation care.

To learn more about Maryland General-Bryn Mawr Rehab Center or to arrange a tour, please call Mary Filippelli our administrative director at (301) 225-8380.

Maryland General-Bryn Mawr Rehab Center. We're the new team in town with lots of experience.

# The Maryland Lupus Foundation: A Commitment to Professional Education

---

Mary Betty Stevens MD

---

*Dr. Stevens is Chairman of the Medical Advisory Committee of The Maryland Lupus Foundation.*

Systemic lupus erythematosus (SLE) is no longer a disorder considered the province of a few in ivory towers. It has come to be recognized as an autoimmune, immune-complex disease of such variable presentation and clinical problems that it necessarily belongs to generalists and multiple specialists, medical physicians and surgeons, and a cadre of allied health professionals.

Several years ago (1983-1984), a series of articles on SLE was published in this journal (vols. 32 and 33) relative to the clinical diagnosis and management of SLE. Now, in October 1991 (Lupus Awareness Month), the Maryland Lupus Foundation has collaborated with the *Maryland Medical Journal* in preparing this issue which is devoted to an update of SLE with emphasis on its clinical spectrum, autoantibody profile, special problems, and management. In this way, the Maryland Lupus Foundation intends to extend its commitment to professional education; and we, the authors, hope to provide you with a valuable resource, regardless of your multiple specific interests. Furthermore, we extend to you the opportunity for your patients (and your office staff) to obtain added patient-related informational publications relative to SLE from the Foundation. ■

*"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."*

Theodore C. Patterson, M.D., Medical Director,  
Meridian Nursing Center—Heritage

#### ***Partners in Healthcare***

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer's patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at all our nursing centers. And special services like short-term or respite care, our own

pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—  
The Professional Choice.

# The History of Lupus Erythematosus

---

Marc C. Hochberg MD, MPH

---

*Dr. Hochberg is Professor of Medicine, Epidemiology and Preventive Medicine, The University of Maryland School of Medicine, Baltimore, MD.*

---

*The history of lupus can be divided into the classical period which saw the description of the cutaneous disorder, the neoclassical period which saw the description of the systemic or disseminated manifestations of lupus, and the modern period which was heralded by the discovery of the lupus erythematosus cell in 1948.*

---

**T**he history of lupus erythematosus (LE) has been reviewed in both of the major textbooks on this disease<sup>1,2</sup> and was the subject of an article in this journal in 1983.<sup>3</sup> This article concentrates on developments in the present century which have logarithmically expanded our knowledge about the pathophysiology, clinical-laboratory features, and treatment of this disorder.

The history of lupus can be divided into three periods: the classical period which saw the description of the cutaneous disorder, the neoclassical period which saw the description of the systemic or disseminated manifestations of lupus, and the modern period which was heralded by the discovery of the LE cell in 1948 and is characterized by the scientific advances noted above. The history of lupus during the classical period was reviewed by Smith and Cyr in 1988.<sup>4</sup> Of note are the derivation of the term lupus and the clinical descriptions of the cutaneous lesions of lupus vulgaris, lupus profundus, discoid lupus, and the photosensitive nature of the malar or butterfly rash. The term lupus (Latin for wolf) is attributed to the thirteenth century physician Rogerius who used it to describe erosive facial lesions that were reminiscent of a wolf's bite.<sup>1,3</sup> Classical descriptions of the various dermatologic features of lupus were made by Thomas Bateman, a student of the British dermatologist Robert William, in the early nineteenth century; Cazenave, a student of the French dermatologist Laurent Bielt, in the mid-nineteenth century; and Moriz Kaposi (born Moriz Kohn), student and son-in-law of the Austrian dermatologist Ferdinand von Hebra, in the late nineteenth century. The lesions now referred to as discoid lupus were described in 1833 by Cazenave under the term erythema centrifugum, while the butterfly distribution of the facial rash was noted by von Hebra in 1846. The first published illustrations of lupus erythematosus were included in von Hebra's text, *Atlas of Skin Diseases*, published in 1856.

The neoclassical era of the history of lupus began in 1872 when Kaposi first described the systemic nature of the disorder:

... experience has shown that lupus erythematosus ... may be attended by altogether more severe pathological changes ... and even dangerous constitu-

tional symptoms may be intimately associated with the process in question, and that death may result from conditions which must be considered to arise from the local malady.<sup>5</sup>

Kaposi proposed that there were two types of lupus erythematosus: the discoid form and a disseminated form. Furthermore, he enumerated various symptoms and signs which characterized the disseminated form including (1) subcutaneous nodules, (2) arthritis with synovial hypertrophy of both small and large joints, (3) lymphadenopathy, (4) fever, (5) weight loss, (6) anemia, and (7) central nervous system involvement.<sup>5</sup>

The existence of a disseminated or systemic form of lupus was firmly established by the work of Osler in Baltimore<sup>6</sup> and Jadassohn in Vienna<sup>7</sup> in 1904. Over the next thirty years, pathologic studies documented the existence of nonbacterial verrucous endocarditis (Libman-Sacks disease)<sup>8</sup> and wire-loop lesions in patients with glomerulonephritis;<sup>9</sup> such observations at the autopsy table lead to the construct of collagen disease proposed by Kemperer and colleagues in 1941.<sup>10</sup> This terminology, collagen vascular disease, persists in usage now fifty years after its introduction.

The sentinel event in the mid 1900s which heralded the modern era was the discovery of the LE cell by Hargraves and colleagues in 1948.<sup>11</sup> The investigators observed these cells in the bone marrow of patients with acute disseminated lupus erythematosus and postulated that the cell "... is the end result of... phagocytosis of free nuclear material with a resulting round vacuole containing this partially digested and lysed nuclear material ...." This discovery ushered in the present era of the application of immunology to the study of lupus erythematosus. Two other immunologic markers were recognized in the 1950s as being associated with lupus: the biologic false-positive test for syphilis<sup>12</sup> and the immunofluorescent test for antinuclear antibodies.<sup>13</sup> Moore, working in Baltimore, demonstrated that systemic lupus developed in 7 percent of 148 subjects with chronic false-positive tests for syphilis and that a further 30 percent had symptoms consistent with collagen diseases.<sup>12</sup> Friou applied the technique of indirect immunofluorescence to demonstrate the presence of antinuclear antibodies in the blood of patients with systemic lupus.<sup>13</sup> Subsequently, the recognition of antibodies to deoxyribonucleic acid (DNA)<sup>14</sup> and the description of antibodies to extractable nuclear antigens<sup>15</sup> expanded the scope of immunodiagnostic laboratory tests in lupus. Presently, patients with systemic lupus are routinely studied for the presence of antinuclear antibodies, including antibodies to double-stranded DNA and extractable nuclear antigens (nuclear ribonucleoprotein (nRNP), Sm, Ro, La), and anticardiolipin antibodies; these autoantibodies are useful in describing clinical subsets and understanding the etiopathogenesis of lupus.

Two other major advances in the modern era have

been the development of animal models of lupus and the recognition of the role of genetic predisposition to the development of lupus. The first animal model of systemic lupus was the F1 hybrid New Zealand Black/New Zealand White mouse.<sup>16</sup> This murine model has provided many insights into the immunopathogenesis of autoantibody formation, mechanisms of immunologic tolerance, the development of glomerulonephritis, the role of sex hormones in modulating the course of disease, and evaluation of treatments including recently developed biologic agents such as anti-CD4 antibodies among others. Other animal models that have been used to study systemic lupus include the BXSB and MRL/lpr mice, and the naturally occurring syndrome of lupus in dogs.<sup>17</sup>

The familial occurrence of systemic lupus was first noted by Leonhardt in 1954 and later studied by Arnett and Shulman at Johns Hopkins.<sup>18</sup> Subsequently, familial aggregation of lupus, the concordance of lupus in monozygotic twin pairs, and the association of genetic markers with lupus have been described over the past twenty years.<sup>19</sup> Presently, molecular biology techniques are being applied to the study of human lymphocyte antigen (HLA) Class II genes to determine specific amino acid sequences in these cell surface molecules that are involved in antigen presentation to T-helper cells in patients with lupus. These studies have already resulted in the identification of genetic-serologic subsets of systemic lupus that complement the clinico-serologic subsets noted earlier. It is hoped by investigators working in this field that these studies will lead to the identification of etiologic factors (e.g., viral antigens/proteins) in systemic lupus.

Finally, no discussion of the history of lupus is complete without a review of the development of therapy. Payne, in 1894, first reported the usefulness of quinine in the treatment of lupus.<sup>20</sup> Four years later, the use of salicylates in conjunction with quinine was also noted to be of benefit.<sup>21</sup> It was not until the middle of this century that the treatment of systemic lupus was revolutionized by the discovery of the efficacy of adrenocorticotrophic hormone and cortisone by Hench.<sup>22</sup> Presently, corticosteroids are the primary therapy for almost all patients with systemic lupus. Antimalarials are used principally for patients with skin and joint involvement on the one hand and cytotoxic/immunosuppressive drugs are used for patients with glomerulonephritis, systemic vasculitis, and other severe life-threatening manifestations on the other.<sup>23</sup> Currently, newer biologic agents are being investigated in treating patients with lupus.

Thus, the history of lupus, although dating back at least to the Middle Ages, has experienced an explosion in this century, especially during the modern era over the past forty years. It is hoped that this growth of new knowledge will allow a better understanding of the immunopathogenesis of the disease and the development of more effective treatments.

# QUALITY

## THE HOPKINS TRADITION

# THE TEST OF PROFESSIONAL LIABILITY COVERAGE ISN'T WHEN YOU BUY IT.

Now Maryland physicians can get coverage from the carrier that offers a

**IT'S WHEN  
YOU USE IT.**

stronger support system at the critical time of need than any other company serving the region.

The carrier is the successful physician-owned National Capital Reciprocal Insurance Company: NCRIC.

The leading professional liability carrier in D.C. now comes to Maryland offering unique approaches to service and protection, all at Maryland rates.

For example, you'll be assigned your own NCRIC claims representative who serves substantially fewer clients

than reps with other carriers. So, in claims and underwriting, you'll get

faster, more personal attention to any question or problem, minor or major.

NCRIC also offers especially attractive coverages for physicians just starting a practice, those practicing in

two or more jurisdictions (D.C., MD, VA) part-time practitioners, and physicians who take maternity leave.

Learn more about the ways NCRIC demonstrates a sensitivity to the needs of the medical community in ways no other carrier does. Call (301) 424-8136.

# The Clinical Spectrum of SLE

---

Mary Betty Stevens MD

---

*Dr. Stevens is Professor of Medicine, The Johns Hopkins University School of Medicine, Baltimore, MD.*

**D**uring this century, there have been enormous developments at every level relative to lupus erythematosus. First and foremost, what was earlier a dermatologic disorder, has emerged as a systemic disease with a broad spectrum of clinical features. Second, systemic lupus erythematosus (SLE) has come to be recognized as an autoimmune, immune-complex process and, on clinical and immunologic grounds, multiple subsets and discreet variants have been identified which differ in process, clinical expression, therapeutic need, and prognosis. Multiple environmental, genetic, and hormonal factors have been described which contribute to the clinical expression or seroreactivity of SLE and its variants. Finally, with the capacity for earlier diagnosis, the therapeutic means for suppressing the disease process, and the consequent prolonged survival, the incidence and prevalence of SLE have progressively increased. For the years 1956-65, the prevalence and incidence of SLE per 100,000 were 14.6 and 2.0,<sup>1</sup> respectively, compared with 50.8 and 7.4 in the interval 1967-73.<sup>2</sup> In our Johns Hopkins experience, a four-year survival of 51 percent reported in 1954<sup>3</sup> was, in 1981, 97 percent at five years and 90 percent at ten years.<sup>4</sup>

In this setting, criteria for the classification of SLE were initially proposed by the American Rheumatism Association in 1971,<sup>5</sup> with revisions in 1982.<sup>6</sup> These criteria are listed in Table 1; the listings have been re-ordered to emphasize both the common denominators and the differences between the two criteria sets. Under both criteria sets, the occurrence of four or more features satisfies the diagnosis of SLE. Independent studies have shown both their specificity and sensitivity to exceed 90 percent, but it must be emphasized that these criteria were developed for the classification of SLE in reports of clinical series and not for the bedside diagnosis of individual patients at any one point in time. Multiple added features of SLE with less sensitivity or specificity<sup>7</sup> contribute to the diagnosis and may be major determinants in the course of the disease.

The initial manifestations and those occurring with time in 140 consecutive patients admitted to The Johns Hopkins Rheumatic

---

*Systemic lupus erythematosus is a complex immunologic disorder with an equally complex clinical presentation and course. In recent years, the earlier recognition of milder disease supported by immunologic markers coupled with means of intervention and suppression, as well as medical/surgical advances has resulted in increases in quality of life and survival.*

---

Disease Unit at Good Samaritan Hospital during a fifty-four-month interval are shown in Table 2. Patients with drug-induced syndromes, discoid lupus alone, rheumatoid arthritis regardless of seropositivity, and undifferentiated connective tissue disease are specifically excluded. The variability in presentation and course of disease is obviated. In fact, the true onset of disease may be difficult, if not impossible, to define with low-grade constitutional symptoms at one point on the spectrum, a routinely discovered laboratory abnormality (e.g., biologic positive serologic test for syphilis) at another, and a fulminant, febrile, multisystem disorder at still another point on the spectrum. For this very reason, the time of diagnosis rather than the date of probable first symptom is focused on in most serial and survival studies.

Table 1. Criteria for SLE Classification

1971	1982
1. Facial erythema	1. Malar rash
2. Discoid lupus	2. Discoid lupus
3. Photosensitivity	3. Photosensitivity

140		

Data modified in tabulation.

N.S. = not stated

BFP - STS = Biologic false positive - serologic test for syphilis

Similarly, the course of disease is highly variable from one patient to another. It is imperative that flares of SLE be distinguished from intercurrent illnesses; this can only be accomplished by thorough, thoughtful clinico-laboratory reevaluations. Even in those with strictly patterned recurrences of active disease (e.g., fever, rash, arthritis, serositis), there is no substitute for repeated assessments since complicating illnesses requiring specific treatment may upset the balance between drug-therapy and SLE control.

Presented here, in brief, are the clinical manifestations of SLE, some of which are dealt with in greater depth in other sections of this journal. It should become clear that SLE is an extremely polymorphic disorder and, in time, may prove to be an umbrella covering a cluster of differing entities.

Constitutional Manifestations

*Fatigue* and easy *fatiguability* may be prominent at times of disease activity either before a diagnosis of SLE can be made or with subsequent flares of the disease. Similarly, unexplained *anorexia* and *weight loss* may occur in a few patients. Most problematic is the *fever* which is present at some time during the course of disease in the majority.<sup>3,5</sup> The pattern of fever varies broadly with a low-grade, sustained, or intermittent temperature elevation at one extreme and a hectic, spiking fever at the other. In almost half, a temperature  $\geq 102^\circ$  has been reported in multiple series.

The issue of fever is a major one in patients with SLE in view of its potential implications and it can be ascribed to SLE activity only after the meticulous exclusion of other causes, especially infection. Chills rarely, if ever, accompany the fever of SLE and, in our experience, they are usually related to complicating infection or antipyretic drug therapy. In one recent series<sup>9</sup> of seventy-four febrile episodes, forty-nine (66 percent) were associated with SLE activity and twenty-five (34 percent) with intercurrent infection. In our SLE population, adverse drug reactions and postoperative fever are frequent occurrences. Thus, in view of the enormous therapeutic implications, the specific cause of fever must be determined with each episode.

Musculoskeletal Manifestations

*Polyarthralgias* or frank *polyarthritis* constitute the most common clinical features of SLE and, in over half of patients, are among the presenting manifestations of the disease. The interphalangeal and metacarpophalangeal joints, wrists, and knees are particularly targeted. The articular inflammation may be fleeting, evanescent, and recurrent or, less frequently, rheumatoid-like clinically with a sustained, symmetrical process.

In a recent series,<sup>10</sup> forty-one (5 percent) of 858 patients with SLE developed clinical deformities of the hands which appeared early in the course of disease and, al-

though clinically rheumatoid-like, were distinct from rheumatoid arthritis. The ulnar deviation and swan neck deformities appeared to be periarticular and ligamentous in origin without erosive changes radiologically. While the differentiation of articular SLE from rheumatoid arthritis can be difficult, especially in the setting of subcutaneous nodules clinically and histologically identical to those seen in rheumatoid arthritis,<sup>11</sup> the synovial fluid of SLE is characteristically less inflammatory and consistently shows a reduced complement level. However, major joint effusions are infrequent in SLE.

*Periarticular* abnormalities occur but tenosynovitis with tendon ruptures is uncommon.<sup>12</sup> Baker's cysts are most often associated with synovitis of the knee and, with rupture or dissection, may result in the pseudothrombophlebitis syndrome<sup>13</sup> which must, of course, be differentiated from the more common true thrombophlebitis.

The most common orthopaedic problem of our SLE patients is *ischemic necrosis of bone* (avascular or aseptic necrosis, osteonecrosis). This lesion, usually polyfocal and affecting predominantly femoral and humeral heads, has been reported in SLE alone but most frequently is associated with corticosteroid-treated SLE. The onset of isolated joint pain in such patients, especially those with a vasculopathy (e.g., Raynaud's disease, vasculitis) should arouse suspicion of this process.<sup>14</sup>

A *polymyositis* occurs in 10 to 15 percent of patients with SLE and is indistinguishable from the inflammatory myopathy alone or in other disease settings. Weakness and muscle tenderness are the cardinal symptoms; elevation of the battery of muscle enzymes (e.g., creatinine phosphokinase (CPK), transaminases, aldolase), characteristic electromyographic findings, and an intense inflammatory infiltrate on muscle biopsy are the rule. Myalgia—only with companion flu-like illness is more common. Thus, every element of the musculoskeletal system can be involved.

### Mucocutaneous Evidence

A myriad of skin lesions and oral membrane ulcerations occur and constitute four of the accepted revised criteria for SLE (Table 1). A listing, far from encyclopedic, is shown in Table 3. The possible mechanisms

of cutaneous injury in the spectrum of lupus erythematosus have recently been well-reviewed.<sup>15</sup> The classical malar rash, present in 30 to 50 percent of patients, may be photosensitive (or not), and such is the case with the more generalized erythematous macular/papular eruptions which are preferentially sited in exposed areas (e.g., extensor surfaces of limbs, V-neck area, face).

While not specific, the demonstration by immunohistology of immune deposits at the dermal-epidermal functional membrane (i.e., band test) of clinically normal skin as well as lesions is supportive of the diagnosis of SLE. A curious linear telangiectasia underlying the lash line of the upper eyelids is almost pathognomonic. Vasculitic lesions are varied in their clinical morphology and reflect active immune-complex disease.<sup>16</sup> Livedo reticularis, blotchy palmar and digital pad erythema, periungual erythema and, less frequently, splinter hemorrhages, and ulcerative lesions of the skin and membranes are commonplace. Subcutaneous nodules, clinically and histologically identical to the rheumatoid nodule, are infrequently seen.<sup>17</sup> It is of interest that erythema nodosum, an immunogenic arteriolitic lesion, is exceedingly rare in active SLE; in a study of our patients with SLE, either a bacterial infection or drug could be identified in all instances.

The circumscribed lesions of discoid lupus occur in approximately 20 percent of those with SLE and may antedate systemic disease by months, even years. The majority of patients with discoid lupus, however, never develop significant systemic manifestations of SLE. Diffuse or patchy alopecia and fractured hairs along the frontal/temporal hairline are frequent associates of active disease. A unique, annular, erythematous skin rash highly associated with photosensitivity has earmarked a subset with subacute cutaneous lupus erythematosus (SCLE) which is characterized further by a low order of systemic disease and a high prevalence of anti-Ro(SSA) positivity. Thus, not only are cutaneous lesions numerous and varied in SLE but some are also pivotal in the distinction of variants with limited major organ involvement.

### Pleuropulmonary Symptoms

*Pleuritis*, with or without effusion, is the most common pulmonary feature, occurring in approximately half of the patients with SLE and as a presenting feature in 10 to 15 percent. The dominant manifestation is typical pleuritic pain with a pleural friction rub present in no more than a quarter of patients. Pleural reaction radiographically is occasionally found in the absence of symptoms but is not consistently present in those with pleuritic pain.

When an effusion is present, the fluid is characteristically exudative with a modest leukocytosis, increased protein, immune complexes, and a decreased complement level. Unlike the rheumatoid effusion with its low glucose and acidic pH, the pleural effusion

**Table 3. Mucocutaneous SLE**

Alopecia	

of SLE has a normal glucose and a pH greater than 7.35.<sup>18</sup> In fact, a low glucose coupled with a normal or elevated complement should alert one to the likelihood of complicating infection.

Sterile *pneumonitis*, a relatively infrequent feature of SLE, is undoubtedly multifactorial in etiology with pulmonary vasculitis rarely found, deposits of complement and immunoglobulin in vessels and alveolar walls found in some patients, and innocent histopathology found in still others. Matthay et al<sup>19</sup> reported *acute lupus pneumonitis* in twelve of 102 patients hospitalized with SLE characterized by severe dyspnea, tachypnea, hypoxemia, and diffuse pulmonary infiltrates on x-ray. All were febrile. Six patients died despite intensive therapy. In four, only nonspecific histologic changes were found. Of the six survivors, all had a residual restrictive ventilatory defect with a low diffusion capacity, and half had residual interstitial infiltrates radiographically. Massive *pulmonary hemorrhage* with fatal outcome has been reported,<sup>20,21</sup> especially in those with lupus glomerulonephritis.

Eisenberg et al<sup>22,23</sup> recognized chronic, diffuse, *interstitial pulmonary infiltrates* as a manifestation of SLE, with progressive dyspnea clinically, and marked restriction of the diffusion capacity on functional testing. On biopsy, nonspecific fibrosis and chronic inflammation are found with immunoglobulin and complement deposits in the interstitium, supporting an immune-complex mediation of this intrapulmonary process.

Finally, there are those with dyspnea associated with the *shrinking lung syndrome* characterized by elevated, dysfunctional diaphragms and diminished lung volumes<sup>24</sup> which may be reversible on therapy.

### Cardiovascular Complications

As shown in Table 4, all elements of the cardiovascular system can be involved in SLE. Despite the changing spectrum of SLE with immunologic recognition of earlier, milder disease and the altered course of disease by therapeutic interventions as well, cardiovascular involvement continues to contribute significantly to the morbidity and mortality of the disease. However, it must be emphasized at the outset that, as with other clinical problems in patients with SLE, cardiovascular complications can be attributed to the disease only after exclusion of alternative explanations.

### Lupus Carditis

Histopathologic evidence of cardiac involvement in SLE exceeds in prevalence its clinical expression. Bulkley and Roberts<sup>25</sup> have emphasized that diffuse multistage lesions, ranging from acute inflammatory foci to their healed, fibrous residua, are found in pericardium, myocardium, and valves, and recent evidence supports their immune-complex induction.<sup>26</sup> The presence of these lesions correlates poorly with antecedent clinical evidence of inflammatory heart disease.

Clinically, pericarditis is the most common cardiac manifestation of SLE, ranging from 19 to 48 percent in several large series, but is a presenting feature of the disease in only  $\leq 2$  percent. In a recent prospective study of 100 SLE patients, Badui et al<sup>27</sup> reported pericarditis in 39 percent. Typically, anterior substernal chest pain, varying with position and, in 8 to 29 percent, an intermittent friction rub, are the dominant clinical features. The true extent of pericardial involvement clearly exceeds that which is clinically apparent in view of the definition of pericarditis by echocardiography in asymptomatic individuals on the one hand, and increased pericardial pathology (up to 50 percent) at necropsy on the other.

Despite the frequent demonstration of pericardial fluid by echocardiography, clinically detectable effusions are uncommon, and cardiac tamponade, rare. Like the pleural and synovial fluid of SLE, pericardial fluid is a low-grade inflammatory exudate. It has been suggested<sup>28</sup> that an acid pH ( $< 7.00$ ) is characteristic and differentiates effusions of SLE from those related to uremia or trauma. The protein is usually elevated and the glucose, unlike rheumatoid arthritis, usually normal. The presence of antinuclear antibodies in seropositive patients and complement-fixing immune complexes, as well as reduced levels of complement components, is the rule. Estes and Christian<sup>29</sup> demonstrated pleural effusions in twenty-two (76 percent) of their twenty-nine patients with pericardial involvement. This close association minimizes the need for diagnostic pericardiocentesis and reserves this procedure primarily for therapeutic removal of fluid when cardiac function is impaired. However, when a pericardial fluid alone occurs as presumptive evidence for SLE activity, its examination may be necessary to be certain that no intercurrent process, especially tuberculosis or other infection, is present.

Constrictive pericarditis rarely develops in SLE but has been reported;<sup>30,31</sup> the demonstration of immunoglobulins in the pericardium further supports its immunogenesis.

The clinical diagnosis of *myocarditis* in SLE has ranged from 8 to 25 percent in major series over the years, with myocardial pathology at necropsy in these and others ranging from 14 to 50 percent. The clinical diagnosis has been problematic, varying on the basis of (1) an unexplained resting tachycardia, (2) electrocar-

diagram (EKG) changes, and (3) one or more of the following: cardiomegaly in the absence of pericardial effusion, a gallop rhythm, ventricular arrhythmias, otherwise unexplained congestive heart failure and, in recent years, elevated serum cardiac (MB) isoenzyme of creatine kinase. Recently, Badui et al<sup>27</sup> determined a prevalence of 14 percent.

Borenstein et al<sup>32</sup> emphasized the association of myocarditis with skeletal myositis. These patients with such striated muscle inflammation were characterized immunologically by the presence in serum of anti-nRNP antibody. The correlation of anti-nRNP, although controversial in SLE, has been emphasized in mixed connective tissue disease (MCTD); MCTD can no longer be considered a discreet clinical entity,<sup>33</sup> evolving in large measure over time into SLE or systemic sclerosis. In the pediatric series by Singsen et al,<sup>34</sup> four (29 percent) of their fourteen patients, ranging in age from twelve to twenty years, developed clinical myocarditis. An additional three patients (21 percent) with clinically silent heart disease were found to have myocardial necrosis, and interstitial inflammation and fibrosis at autopsy. Thus, clinical criteria for myocardial involvement in SLE are insensitive. Nonetheless, congestive heart failure not otherwise explained is uncommon.

The classical cardiac lesion of SLE, described by Libman and Sacks in 1924,<sup>35</sup> is the verrucous *endocarditis* which, prior to echocardiography, was a pathologic rather than clinical diagnosis. While systolic murmurs occur in 16 to 44 percent of patients with SLE and diastolic murmurs in less than 5 percent, neither correlates well with the presence of Libman-Sacks endocardial verrucae found at necropsy. Although any valve can be involved, the mitral is dominant and the aortic valve comparatively infrequent. Bulkley and Roberts<sup>25</sup> emphasized the close association of such valvular lesions with concomitant pericarditis present in sixteen (90 percent) of their eighteen autopsied patients with endocarditis. Overall, the major manifestations of these verrucae have not been valvular dysfunction but, rather, embolic phenomenon or, infrequently, secondary infection.

Hemodynamically significant valvular lesions, especially mitral and aortic insufficiency, do occur in SLE but are morphologically distinct from the Libman-Sacks lesions. Galve et al<sup>36</sup> reported a prospective echocardiographic study of seventy-four patients with SLE and found both Libman-Sacks verrucae (seven patients) and thickened rigid valves (six patients). It was in the latter group that valve surgery was required (five or 83 percent) during a five-year follow-up period, in contrast to only one (14 percent) of the seven with Libman-Sacks lesions. Valvular stenosis, although well-recognized, is far less frequent than the valve incompetence.

*Conduction defects* in adult SLE, ranging from 34 to 70 percent, are most often expressed as nonspecific ST-T changes on EKG. Although first-degree heart block is well-recognized, high-grade heart block is un-

usual in the absence of frank myocarditis or a coronary occlusion. Auricular fibrillation without explanation other than SLE has been reported, but significant arrhythmias are unusual. In all patients studied by Bulkley and Roberts,<sup>25</sup> the nodes and atrioventricular bundles were normal, but the proximal bundle branch segments were abnormal in 50 percent with fibrous scarring more marked than acute inflammation. These changes correlated closely with the conduction defects noted antemortem -- namely bundle branch block and a single instance of complete atrioventricular dissociation. These data are in contrast to earlier ones which demonstrated arteritis, inflammatory cell aggregates, and patchy fibrosis with scarring of the sinus and atrioventricular nodes. The differences between these data sets are presumptively related in large part to the corticosteroid intervention more recently used.

The primary interest relative to conduction abnormalities has focused not in the adult but in the neonate with lupus and congenital heart block.

### Vascular Lesions

The cardiovascular lesions of SLE have recently been well-reviewed.<sup>37</sup> In addition to a pancarditis, multiple peripheral vascular lesions occur. *Raynaud's phenomenon* occurs in approximately one-quarter of our patients and is usually an early and nonprogressive problem. Unlike systemic sclerosis, the Raynaud's of SLE only infrequently progresses to fixed peripheral vascular insufficiency with digital gangrene. In fact, unpublished observations in our SLE patients would indicate that this vasospastic phenomenon pretreatment may abate after the institution of corticosteroid therapy to the extent that almost half of the patients, years later, do not recall it as a feature of their disease.

In reviewing the literature, Raynaud's is reported in 10 to 58 percent of patients, presenting initially in 1 to 5 percent. While it may long antedate the diagnosis of SLE as retrospectively reviewed, SLE is an uncommon outcome in those patients, especially young women, prospectively followed for Raynaud's alone. In SLE, Raynaud's does not appear to earmark any discreet demographic, clinical, or immunologic subset, although it may be a risk factor for ischemic bone necrosis<sup>38</sup> and pulmonary hypertension.<sup>39</sup>

*Systemic vasculitis* contributes in a major way to the morbidity of SLE. While the consequences of small vessel inflammation are presented elsewhere in this journal, it should be emphasized here that a broad array of ischemic lesions occur in SLE on this basis, including cutaneous and membrane ulceration, myocardial infarction, bowel perforation, and central and peripheral neuropathies. While small vessel involvement is the hallmark of SLE, infrequent *arteritis* of the medium and large muscular arteries has also been reported including pulseless syndromes.

The prevalence of *systemic hypertension* is somewhat

controversial. A review of the literature suggests that hypertension was less frequent in the series of the 1950s (7 to 14 percent) than in the 1970s and after (25 to 49 percent), which is in contrast to the report of Hashimoto and Shiokawa<sup>40</sup> who found, regardless of trends over time, that hypertension was related to lupus nephritis in the majority. In the selective autopsy series of Bulkley and Roberts,<sup>25</sup> twenty-five (69 percent) of their thirty-six patients had been hypertensive, with clinically evident lupus nephritis in twenty-one (84 percent) of the twenty-five. In the group with hypertension, higher dosages of corticosteroids had been chronically administered.

*Pulmonary hypertension* is uncommon in SLE and its pathogenesis is uncertain. An association with Raynaud's phenomenon has been observed and Raynaud's is far more frequent in those with pulmonary hypertension than in the general SLE population. Perez and Kramer<sup>39</sup> reported Raynaud's in three of their four patients; in one, there was a marked increase in the severity of Raynaud's just before pulmonary hypertension emerged. In addition, arteritis, arteriolitis, and immune-complex deposition in the lung have been documented but not consistently associated with hypertension in the pulmonary circuit. In SLE, the occurrence of pulmonary hypertension is a serious, poor prognostic sign.

*Thrombophlebitis* occurs in 2 to 12 percent of adults with SLE. Caciuro et al<sup>41</sup> found it to be an initial manifestation in 9 percent of forty-two children. Recurrent thrombophlebitis may also occur early in adults, at or even before the time of diagnosis but, in our population, is very infrequent in those already on therapy for SLE. In fact, true thrombophlebitis has not been observed more frequently than the pseudothrombophlebitis syndrome<sup>13</sup> from which it must be distinguished. However, recurrent venous thromboses can occur in the subset with the antiphospholipid antibody syndrome.<sup>42</sup> Thrombosis of the renal veins and inferior vena cava is a reported complication of lupus nephritis.<sup>43</sup>

The *antiphospholipid antibody syndrome*,<sup>44</sup> in addition to its associated risks in pregnancy, has broad cardiovascular implications. In addition to arterial and venous thromboses, the presence of antiphospholipid antibodies has recently been associated with Libman-Sacks verrucal endocarditis or valvular insufficiency.<sup>45,46</sup> This is not only of major clinical significance but also reopens the issue of pathogenesis of the valvular lesions.

*Coronary artery disease* in SLE exceeds the expected prevalence for a demographically matched non-SLE population and can reflect multiple lesions including arteritis, circulating antiphospholipid antibodies, or accelerated arteriosclerosis. Urowitz et al<sup>47</sup> analyzed deaths from SLE and reported a bimodal distribution, with those deaths early in the course of disease associated with active SLE and those two-and-one-half years or more after diagnosis due to myocardial infarction. Spiera and Rothberg<sup>48</sup> reported four young adults

with acute myocardial infarctions who had had chronic corticosteroid therapy since the childhood onset of SLE, hypertension, and arteriosclerotic coronary arteries defined at autopsy in two and angiographically in another. Others have also described, by angiography, occlusions of the coronary arteries and, rarely, coronary arteritis with aneurysms.

The basis of ischemic heart disease is variable. Premature atherosclerotic plaques with narrowing of the major coronary arteries<sup>25</sup> have been associated with prolonged administration of corticosteroids; the suggestion of less coronary involvement in the pre-steroid era would tend to support this concept. However, Haider and Roberts<sup>49</sup> did not find a comparative excess of corticosteroids in their young SLE patients with severe coronary atherosclerosis but rather found hypercholesterolemia, systemic hypertension, and a higher prevalence of mitral valvular and pericardial lesions. These observations suggest that the more extensive, severe lupus carditis may imply an immunogenesis of lesions in the coronary system. Nonetheless, arteritis of the coronary arteries is a rare cause of ischemic heart disease with others being embolization and altered intravascular coagulability. Thus, there would appear to be multiple, variable coronary lesions and risk factors among patients with SLE which must be considered for optimal treatment. Vigorous management of risk factors (especially systemic hypertension, hypercholesterolemia, and tobacco abuse) is emphasized.<sup>50</sup>

### Renal Manifestations

Lupus nephritis has been a major focus of interest for clinicians and investigators alike in view of its dominant influence on the morbidity and mortality of SLE. In a multicenter study of SLE outcome,<sup>51</sup> there were twenty-two deaths among the 1,103 patients entered and followed from 1965 to 1978. In 193 (87 percent), a specific cause of death was identified. Death was attributed to SLE organ involvement in sixty-eight (35 percent) and to infection in seventy-four (38 percent). Of those with SLE as the primary cause of death, lupus nephritis exceeded all others, singly and collectively, and accounted for forty-one deaths. Thus, the presence or absence of renal involvement becomes a critical factor in designing therapy and projecting prognosis.

An enormous body of literature has been accumulated to establish immune-complex glomerular injury, especially nDNA-anti-nDNA.<sup>52,53</sup> In our patients, clinically evident glomerulonephritis has been present in 48 percent of 140 patients reported in 1976 and 31 percent of an additional 150 patients reported in 1985.<sup>54</sup> This decline in clinically problematic renal disease in the Johns Hopkins' experience since the 65 percent prevalence reported by Harvey et al<sup>3</sup> has been the major change in disease expression over the years and may reflect earlier treatment of milder disease with corticosteroids which, as in the experimental immune

nephritis in the animal model, may modulate, even tamponade, renal injury.<sup>55</sup>

Pathologically, a World Health Organization classification has evolved and is widely accepted, although still controversial in terms of clinical long-term implications (Table 5). Class I and Class II are normal by light microscopy. While Class I is also normal by electron microscopy and immunofluorescence, mesangial abnormalities are seen by these techniques in Class II. The tissue changes are the same in Classes III and IV but differ in degree with less than 50 percent of glomeruli involved in Class III and more than 50 percent in Class IV. In these groups, progressive proteinuria and renal dysfunction are found along with an active urinary sediment. In Class V, necrotizing and proliferative glomerular lesions are lacking, and the glomerular basement membrane is diffusely thickened. Marked proteinuria occurs in the vast majority and, clinically, with the nephrotic syndrome. Those with diffuse proliferative lupus nephritis (Class IV) have been thought to have the most serious prognosis and limited survival,<sup>56</sup> but the added recognition of progression of Classes II and III to Class IV over time compounds the difficulty in projecting the course and outcome on a single biopsy. Furthermore, Cameron et al<sup>57</sup> found no difference in the long-term outcome of the different histologic groups in their seventy-one patients with SLE and clinical evidence of nephritis, in contrast to the observations of Appel et al.<sup>58</sup>

The other problematic dimension of lupus nephritis is the confirmed observation that histologic glomerulonephritis can occur in the absence of any abnormalities on urinalysis. Nonetheless, the clinical hallmark of early, active lupus nephritis is a kaleidoscoped urinary sediment with varying degrees of proteinuria. Renal insufficiency, with decreased clearance of creatinine and its elevation in serum, is generally late to appear. It has been emphasized that rigorous monitoring of urinary sediment and renal function is essential to identifying renal involvement at a stage responsive to therapeutic intervention, with renal biopsy also of help in establishing indications for therapy.<sup>59</sup> Edworthy et al<sup>60</sup> developed a scheme of stratification of value in projecting outcome which was based on renal function. In a series of patients with biopsied lupus nephritis, Esdaile et al<sup>61</sup> emphasized the duration of renal disease pre-biopsy, overall severity of SLE, presence of vasculitis, and hypertension of prognostic significance, as well as renal status. Both studies<sup>60,61</sup> found a decreased level of C3 of value as a marker of activity and progression.

**Table 5. Classification of Lupus Nephritis: World Health Organization**

- I. Normal
- II. Mesangial change
- III. Focal proliferative glomerulonephritis
- IV. Diffuse proliferative glomerulonephritis
- V. Membranous glomerulonephritis

While circulating anti-nDNA antibody has been repeatedly shown to be associated with lupus nephritis, it is an insensitive marker for both diagnosis of a renal lesion and monitoring of disease activity at the renal level.

**Neuropsychiatric Indications**

Nervous system involvement by SLE represents a major problematic issue. At the outset, it must be emphasized that the neuropsychiatric illness due to SLE and its vasculitis must be differentiated from that of other causes in patients with SLE (e.g., hypertension, renal failure, drugs, complicating infection).

Involvement of the central or peripheral nervous system occurs in 25 percent to more than 50 percent of patients with SLE. In our experience, neuropsychiatric SLE was a feature in 37 percent of patients studied during 1970 to 1975<sup>8</sup> and in 55 percent of those studied from 1980 to 1984.<sup>54</sup> It seems unlikely that this escalating trend reflects increasing survival in view of the emergence of nervous system involvement early in the course of disease in the majority. In both our series and those of others, the clinical expression of central nervous system (CNS) and peripheral nervous system (PNS) involvement by SLE is remarkable for its variability and multilevel involvement. The spectrum of neuropsychiatric manifestations has recently been well-reviewed.<sup>62,63</sup>

Of our 140 hospitalized SLE patients reported earlier,<sup>8</sup> neuropsychiatric illness of SLE (NP-SLE) with the specific features cited in Table 6 was found in fifty-two (37 percent). The only statistically significant correlates with NP-SLE were vasculitis apart from the nervous system and thrombocytopenia. In addition, there were nineteen (14 percent) with psychiatric or neurologic events for which an alternative cause could be identified. In a later series of 150 outpatients and inpatients,<sup>54</sup> eighty-three (55 percent) had NP-SLE; CNS involvement was more frequent (fifty-nine patients, 39 percent) than PNS (thirty-two patients, 21 percent), organic psychosis (twenty-four patients, 16 percent), and seizures (twenty patients, 13 percent). Thus, NP-SLE represents a prominent cluster of clinical problems.

**Table 6. Neuropsychiatric (NP) SLE<sup>8</sup>**

	NP-SLE	SLE
Total No. Patients	52 (37%)	140
Psychiatric	24 (46%)	17%
Seizures	17 (33%)	12%
Long tract signs	16 (31%)	11%
Cranial nerve	16 (31%)	11%
Peripheral neuropathy	15 (29%)	11%
Cerebellar	5 (10%)	3%
Scotomata	4 (8%)	3%
Pseudotumor	2 (4%)	1%
Chorea	2 (4%)	1%
Meningitis, myelitis	1 (2%)	<1%

Data emphasize prevalence of individual neuropsychiatric features among those with central nervous system/peripheral nervous system involvement and in SLE overall.

*Organic brain syndromes* may be subtle in their presentation with impaired intellect and judgment or memory lapses which may be transient and intermittent but, if unrecognized and untreated, can be progressive. In one study, Carbotte et al<sup>64</sup> found impaired cognitive function in the majority (66 percent) of sixty-two SLE patients compared to 14 percent of normal controls. *Psychiatric events*, even frank psychosis, occur frequently among those with diffuse cerebral involvement and, often in the setting of SLE activity apart from the nervous system on the one hand, and with other CNS/PNS lesions on the other. Lim et al<sup>65</sup> found correlations between neurologic lesions and psychosis in SLE. Affective disorders and anxiety were related to environmental factors and stresses rather than SLE activity.

*Seizures* of any type occur in up to one-third of SLE patients with grand mal seizures most common. Petit mal and temporal lobe seizures and, least frequently, Jacksonian marches, have been reported. These events can occur at any time but, in our patients, have been observed more often within the first year after SLE diagnosis or even before SLE is clearly established. A chronic seizure disorder rarely occurs.

A multiplicity of *focal neurologic lesions* occurs,<sup>8,63,66</sup> including cerebrovascular accidents, cranial and peripheral neuropathies and, less frequently, cerebellar infarcts, transverse myelitis, chorea, and other movement disorders. The dominant underlying process is an immune-complex-mediated vasculitis although active vasculitis, at autopsy, is infrequent.<sup>67</sup> This can be explained in large part by response to therapy and the temporal distance between the clinical event and postmortem examination. An alternative pathway to intracranial infarctions is the altered coagulability and thromboembolic complications of the antiphospholipid antibody syndrome.<sup>68,69</sup>

Additional immunologic mechanisms in NP-SLE have been supported by the association of anti-neuronal antibodies in the cerebrospinal fluid of the subset with diffuse cerebritis<sup>70</sup> and cognitive defects,<sup>71</sup> and the close association of antiribosomal P protein antibodies with psychosis.<sup>72</sup>

It is likely that these recently recognized immune systems will increase our diagnostic capacity for establishing NP-SLE, for the diagnosis can be difficult and problematic in view of the insensitivity of cerebrospinal fluid abnormalities on routine testing and lack of specificity of electroencephalogram (EEG) changes. Evoked potentials (visual, auditory, somato-sensory) have been useful in confirming anatomic pathways and may prove to be a sensitive measure of cerebral dysfunction,<sup>73</sup> but data are still limited. Imaging by x-ray computed tomography (CT) and the more sensitive magnetic resonance (MRI) are, at present, the optimal means for identifying focal lesions with advantage for CT scanning in identifying acute hemorrhagic lesions. When one recalls the microscopic lesions<sup>67</sup> characteristic of CNS-SLE, namely arteriolar microinfarcts

and hemorrhage, it is not surprising that cerebral angiography is of low yield.

Finally, Kremer et al,<sup>74</sup> coupling psychiatric interviews with a battery of standardized psychological tests, have emphasized a high prevalence of mild nonorganic, nonpsychotic psychopathology in patients with SLE which does not correlate with underlying CNS-SLE, severity or activity of SLE, or corticosteroid therapy. Somatic and neurotic concerns, anxiety, tension, and a depressive mood were prominent.

### Reticuloendothelial/Hematologic Manifestations

Overall, considering the larger reported series, *lymphadenopathy* occurs in 23 to 59 percent of patients with SLE but is particularly prominent in the young.<sup>75,76</sup> In our earlier series of eighty-two patients, lymphadenopathy was present in 78 percent of those aged ten to twenty-nine years, 38 percent in the thirty to forty-nine year age group, and only 22 percent of those fifty years of age or older. Occasionally, adenopathy can be so prominent that a lymphoma is suggested clinically.

*Splenomegaly* occurs less frequently (< 20 percent), and only rarely is splenectomy indicated for refractory cytopenias, especially thrombocytopenia.<sup>77,78</sup> In the majority, hematologic response is prompt and sustained postoperatively with platelets returning to  $\geq 150,000$ , an increase in hematocrit  $\geq 20$  percent in those with hemolytic anemia, and return of white blood count to normal in the few with companion leukopenia preoperatively.

*Hematologic abnormalities*, collectively, are common with an anemia in 38 to 98 percent which is multifactorial and hemolytic in less than 20 percent. Leukopenia, usually mild in degree, occurs in 35 to 80 percent. Least common is a marked thrombocytopenia in 7 to 21 percent. While severe SLE-related leukopenia (< 3000 cells/cmm) compromising host defense against infection has been observed, it is infrequent. When leukopenia of this degree occurs, one must search intensively for an alternative cause (especially drug). The hematologic abnormalities generally respond to medical therapy.

The spectrum of autoantibodies is presented elsewhere, but the circulating lupus anticoagulant merits mention here as well. A misnomer, this autoantibody is neither confined to SLE nor promotes hemorrhage. Its prevalence ranges broadly in SLE (for reasons of technique and case selection) from 5 to greater than 50 percent. There is an increased frequency of thrombocytopenia<sup>79-81</sup> in the anticoagulant (or antiphospholipid) subset. In the few who do have bleeding, it is in those who also have low platelets or, less frequently, a prothrombin deficiency. The association with intraarterial and intravenous thrombosis has been well established by numerous investigators, as well as pregnancy failure. Furthermore, it has recently been suggested that it may enter into the pathogenesis of the Libman-Sacks endocardial, valvular lesion.

## Additional Clinical Dimensions

Multiple *ocular* lesions are found in SLE patients with white patches or cytooid bodies (a histologic term) in up to 15 percent of patients usually with otherwise evident active disease. Fortunately, severe disease with visual impairment or loss is rare but can occur as a result of optic neuropathy or retinal vaso-occlusive disease.<sup>82,83</sup> Such lesions are associated not only with active SLE but also with involvement of the CNS. In addition, secondary Sjogren's syndrome with xerophthalmia (even keratoconjunctivitis sicca) and xerostomia can complicate SLE, and there is current interest in the clinical and immunologic common denominators between Sjogren's and SLE.

*Otic* abnormalities are infrequent but serious middle ear effusions, not otherwise explained, have been reported. Hearing deficits are rare, and autoimmune hearing loss is associated with ANA-positivity rather than clinical SLE. Acute *laryngeal* inflammation and edema can occur,<sup>84,85</sup> and isolated cricoarytenoid arthritis has been found in a few instances. Steroid-responsive throat pain has been present in several of our patients (less than 1 percent) and unless associated with clinically apparent inflammation or vasculitis has been reported rarely by others.

*Lower urinary tract* abnormalities have long been recognized and, in one autopsy series,<sup>86</sup> were present in sixteen (46 percent) patients.<sup>86</sup> Interstitial cystitis was most common with vasculitis and perivascular inflammatory lesions present. The process has been shown to be an immune-complex vasculitis and, in SLE, is associated with high titer ANA-positivity in the majority.

Finally, the role of the *endocrine system* and presence of endocrinopathies in SLE are still incompletely answered. The dominance of young women, the milder disease in late-onset SLE in postmenopausal women, the intensification of the disease by estrogens in the experimental model of SLE (NZB/NZW F1 hybrid mouse), as well as its amelioration by maleness, all support *hormonal* modulation of the disease. The issue of safety and tolerance of estrogen therapy in the older woman with SLE has not been adequately addressed. Apart from the sex hormones, most attention has been focused on the *thyroid* in view of Hashimoto's thyroiditis being the prototype of organ-specific autoimmune disease. Some investigators, but not all, have found an increase in rheumatic disease or antinuclear antibodies in those with immune thyroiditis. The converse is also true with respect to thyroid disease or anti-thyroid antibodies in SLE. Case reports have focused on SLE with companion thyrotoxicosis or hypothyroidism, but large series of patients with SLE have not demonstrated a significant excess. Tsokos et al<sup>87</sup> reported fourteen patients with type B insulin-resistant *diabetes mellitus* with eight (60 percent) fulfilling criteria for SLE and twelve (86 percent) with ANA-positivity. Furthermore, a patient with SLE and

diabetes mellitus with islet cell antibodies has been reported, but thorough study of the association, clinically and immunologically, is lacking.

## Final Comment

SLE is a complex immunologic disorder with an equally complex clinical presentation and course. Any single feature or combination may reflect the process. With immune-complex vasculitis (a cardinal lesion), tissue involvement is broad and diverse. Earlier recognition of milder disease supported by immunologic markers coupled with means of intervention and suppression, as well as general medical/surgical advances has effected progressive increase in quality of life and survival in recent years. With immunomodulators yet to be determined, further resolution of the disease process becomes feasible.

# YOCON<sup>®</sup>

## YOHIMBINE HCl

**Description:** Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubiaceae and related trees. Also in *Rauwolfia Serpentina* (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

**Action:** Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

**Indications:** Yocon<sup>®</sup> is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

**Contraindications:** Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

**Warning:** Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

**Adverse Reactions:** Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.<sup>1,2</sup> Also dizziness, headache, skin flushing reported when used orally.<sup>1,3</sup>

**Dosage and Administration:** Experimental dosage reported in treatment of erectile impotence.<sup>1,3,4</sup> 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.<sup>3</sup>

**How Supplied:** Oral tablets of Yocon<sup>®</sup> 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

# **We pay attention to every detail.**

With today's advanced medical technology, we're able to produce diagnostic images of remarkable complexity, clarity and detail. Which is why our head and body MRI imaging services are so valuable to you and your patients.

Magnetic Imaging of Baltimore's (MIB) dedicated radiologists and staff provide your patients with the care and experience you expect. We are able to schedule your patients within 24 hours of their request at our convenient location on the campus of Greater Baltimore Medical Center.

At Magnetic Imaging of Baltimore, we realize what a difference the details can make. So take a closer look. You might discover something your patients should know about.

# Vascular Lesions in SLE

---

Thomas M. Zizic MD

---

*Dr. Zizic is Associate Professor of Medicine, The Johns Hopkins University School of Medicine, Baltimore, MD.*

---

*The confusing array of manifestations resulting from multisystem involvement in SLE is due, in part, to the widespread involvement of blood vessels.*

---

The clinical picture of systemic lupus erythematosus (SLE), particularly at its onset, may assume a wide variety of patterns. A single organ system may be involved such as the skin, joints, or kidneys; or several systems may be implicated. The disease may appear with a confusing array of manifestations resulting from multisystem involvement in which it is difficult to detect any obvious continuity. In part, this is due to the widespread involvement of blood vessels in SLE which was first emphasized by Baehr et al in 1935.<sup>1</sup> They described vascular lesions throughout the finer ramifications of the systemic and, at times, the pulmonic circulation. These varied from simple dilatation of the capillary bed in certain areas to proliferative lesions of the lining endothelium of capillaries, arterioles, and venules often associated with thrombi obstructing the lumen. Also noted were degenerative and necrotizing lesions in the wall of such vessels associated at times with thrombosis and hemorrhage into adjacent tissues. Most characteristic was the peculiar hyaline thickening of the capillary walls of the glomeruli which they designated as the wire-loop lesion.

Vascular lesions were encountered during histologic examination of the various organs. These alterations are described together. They were most frequent and most severe in the vessels of the kidneys but were found not infrequently in vessels of almost all the organs and tissues of the body, including those of the lesser circulation. In fact, in certain organs, such as those of the gastrointestinal tract, vascular alterations were the sole manifestations of collagen injury. In addition, renal, central nervous system (CNS), vascular, and infective complications are implicated most often in the mortality of the disease (Table 1).

## Pathology

Although vascular inflammation may be of varying degrees of severity, clinically the term vasculitis is used to denote an inflammatory disease of blood vessels usually resulting in destruction of vessel walls and producing vascular occlusion. In this type of

severe or necrotizing vasculitis, ischemia is the common denominator of tissue injury. In the classic paper on the pathology of SLE, Klemperer et al pointed out that the widespread involvement of blood vessels in SLE resulted in its comparison with periarteritis nodosa in which vascular involvement is, in fact, the fundamental feature.<sup>2</sup> Intense degeneration of collagen in the arteries is essential in both diseases (Table 2). In both, the damage of the collagen in the vessel wall may lead to total necrosis. In periarteritis nodosa, in contrast to lupus erythematosus, such degeneration or necrosis is accomplished by a most conspicuous inflammatory reaction in which the participation of eosinophils is noteworthy. As a rule, in periarteritis nodosa, vessels of larger caliber suffer the greatest damage, while smaller vessels and even capillaries may occasionally be affected. The converse is true of the vascular involvement in lupus erythematosus, in which the rule is: predominant damage of the smaller arteries and capillaries with only infrequent participation of the medium-sized vessels. In the latter, the similarity of the lesions may even suggest periarteritis nodosa microscopically.

The massive destruction of the blood vessel wall leading to hemorrhage, on the one hand, or to aneurysm formation, on the other, is a feature par excellence in periarteritis nodosa. This does not occur in lupus erythematosus except for aneurysms observed only microscopically in a few of the larger arteries.

In SLE, the mildest recognizable change is a deposit of homogeneous eosinophilic material (so-called fibrinoid) within the intima, between muscle fibers of the media, or within the adventitia. It is generally accompanied by fibroblast proliferation. In the intima, this proliferation often results in considerable narrowing of the lumen without any participation of the endothelium. The newly formed fibroblasts generally exhibit degenerative changes as evidenced by distortion of the nuclei and by pyknosis.<sup>2</sup>

Further progression of this process leads to involvement of more and more of the vessel wall so that in the intima, complete rings of fibrinoid masses are laid down, lifting the endothelium from the media and choking the lumen. Intimal masses may fuse with medial masses across the elastic membrane. In turn, fusion with adventitial masses may follow. With complete fibrinoid change of the collagenous framework of the vessel wall, destruction of muscular and elastic elements ensues. In this phase, there is a striking proliferation of adventitial cellular elements which show degenerative changes.

This analysis of the vascular lesions must inevitably reduce them to a mere local expression of the fundamental connective tissue injury. In a morphogenetic sense, the vessel suffers injury only so far as it contains connective tissue.

This is not unreasonable if one considers that a blood vessel consists of specific functional elements (endothelium, muscular fibers, and elastic fibers) bound together by a supporting framework of connective tissue. And it is this tissue, primarily, which bears the brunt of injury in this disease. This is evident in the fibrinoid degeneration of collagen fibers in the adventitia.<sup>2</sup> In contrast to the arteriocapillary system, with its outstanding participation, the veins are infrequently altered. Not only is the inflammatory response in vessels often mild in SLE, but the interactions are primarily local events with mediators working within a short distance of their release. Thus, it is not surprising that there is usually no evidence of vascular inflammation in serologic samples and that a definitive diagnosis of vascular involvement in a given organ system generally requires histologic confirmation. Even tissue samples may not demonstrate the lesions because of the caliber of the vessels involved; the spottiness of the changes with skip areas; and the frequent requirement for intensive anti-inflammatory therapy prior to obtaining tissue. In certain organs, such as the heart, spleen and CNS, tissue samples are generally available only at postmortem examination.

Heart

The pathological cause of coronary artery disease in lupus patients as determined by autopsy studies is arteritis, atherosclerosis,<sup>3</sup> or embolic occlusion (Table 3). With the possible exception of rheumatoid vasculitis, coronary vasculitis occurs more commonly in SLE than in other members of the collagen-vascular diseases.<sup>4</sup>

Of the autopsied patients reported by Harvey et al, 55 percent had some form of myocardial involvement;

Table 3. Heart

Coronary Arteries	
Premature atherosclerosis	
Vasculitis	
Embolic occlusion	

in 80 percent of these, the myocardial changes were considered to be due entirely to SLE.<sup>5</sup> At times, the alterations produced in the myocardium by the

lupus process were very extensive; at other times, they were scattered and focal. The intimal lining of the small coronary vessels was sometimes occluded with resultant ischemic necrosis. Fibrinoid degeneration and even necrosis are occasionally observed in the walls of small coronary arteries.<sup>2</sup> These alterations are generally focal. Other vessels may contain organizing eosinophilic masses; whether these are local in origin or embolic cannot be unequivocally determined. Despite a variety of cardiac lesions in SLE, it is the necrotizing vasculitis which frequently leads to fatal coronary thrombosis and myocardial infarction, especially in young patients with SLE.<sup>4</sup> Since the epicardial coronary arteries are normally inaccessible to biopsy, coronary vasculitis is seldom correctly diagnosed clinically and can rarely be verified without histopathology at postmortem examination. Coronary angiograms have documented multiple high-grade stenosis similar to that seen in ordinary coronary artery disease,<sup>6</sup> as well as multiple aneurysms along the course of a major coronary artery consistent with arteritis.<sup>7</sup> Although arteritis of intramyocardial vessels is not uncommon, active arteritis of major coronary arteries is rarely encountered. In most of these cases, there is evidence of active disease in other organ systems as well.<sup>3</sup>

The more common cardiac finding at autopsy of lupus patients is atherosclerosis. Bulkley and Roberts detected significant coronary disease in nine of thirty-six autopsied patients.<sup>8</sup> In eight, the coronary disease was due to atherosclerosis and in the ninth, it was due to an embolus. In this regard, there is a relative absence of deaths from myocardial infarction and atherosclerotic heart disease in the earlier reports, contrasted with a 4 percent incidence in Estes and Christian's<sup>9</sup> group, as well as in that of Dubois et al.<sup>10</sup> The rising incidence of atherosclerosis may be caused by the association of older age in the later series and long-term corticosteroid treatment which has been shown to accelerate this condition.<sup>11</sup>

Bidani and his coworkers performed immunopathological studies on cardiac tissue of ten patients with severe SLE who died.<sup>12</sup> There was positive staining for immune reactants, predominantly immunoglobulin G (IgG), in nine of the ten cases. No staining was detected in two control cases. The pattern of staining was granular, suggesting the presence of immune complex aggregates, and the predominant sites of deposition were in the walls of the blood vessels of the pericardium and myocardium. In another study, it was noted that the frequencies of mitral valvular disease and pericardial adhesions were significantly greater in the group of lupus patients with severe coronary narrowing, suggesting that the severity of the disease itself may be related to the coronary pathology.<sup>13</sup> Some authors have noted lesions of healed or active arteritis in coronary arteries with atherosclerosis, implicating vasculitis in the accelerated atherosclerotic process.<sup>14</sup>

In one-third of the autopsied patients reported by

Harvey et al,<sup>5</sup> the verrucous bacterial vegetation described by Libman and Sacks was found.<sup>15</sup> While the title of their article does not refer to the subject, their report represents the first significant contribution to the morbid anatomy of acute lupus erythematosus. Mural endocardial vegetations may be small and verrucous but are most often yellowish gray, tawny, or pink plaques with an irregular outline, measuring a few millimeters to as much as a centimeter in diameter.<sup>2</sup> They occur nearer the base of the ventricle rather than toward the apex (i.e., in the outflow tracts or in the areas between the valve rings and the tips of the papillary muscle).

The lesions are, in general, verrucous in appearance -- dry, granular, tawny or pink vegetations varying in size from that of a pinhead to 3 or 4 mm. They may be single or conglomerate. The single lesions resemble minute beads or pyramids and are not easily removed from the endocardium. This type is more frequent on the valves. Sometimes they form large mulberry-like clusters which are actually independent from the valvular endocardium. The earliest endocardial change encountered, both mural and valvular, is a subendothelial fibrinoid degeneration of the ground substance.<sup>16</sup> In more advanced lesions, the fibers also undergo the same change. Fibroblast proliferation, degeneration, and necrosis accompany the changes in fibers and ground substance. In the most advanced phase, the connective tissue becomes completely necrotic, and basophilic fragments of nuclei, cytoplasm, and fibers become set in the granular eosinophilic ground substance. Such foci are undoubtedly what Gross characterized as "hematoxylin stained-bodies" and described in great detail.<sup>16</sup>

In the series reported by Klemperer et al, macroscopic endocardial vegetations were evident on 40 percent of the cases. In an additional 20 percent, microscopic examination revealed endocardial lesions that are regarded as the early phase of the grossly visible alterations. In this initial phase, one sees focal clumps of altered ground substance in the superficial connective tissue layers of the valves, frequently just below the intact endothelium. These clumps appear as homogeneous, deeply eosinophilic masses. In this study, a number of vessels contained organizing eosinophilic masses and, although they were not unequivocally embolic in origin, it is of interest that in all but a single case, they were associated with endocardial excrescences. The pathogenesis of Libman-Sacks endocarditis and thrombotic thrombocytopenic purpura (TTP) in SLE may be related. The presence of Libman-Sacks endocarditis in three of the seven patients with clinical TTP raises the possibility that small vessels were occluded by endocardial emboli.<sup>17</sup> In some patients, widespread microemboli from the heart might form the vascular lesion responsible for initial development of microangiopathic hemolytic anemia (MAHA) and other features of TTP. Alternatively, a primary disorder of fibrin metabolism or endothelial cells may facilitate deposition of fibrin and platelets on the en-

dothelium of small vessels and cardiac valves. The lupus anticoagulant, a population of antiphospholipid antibodies, is associated with an increased incidence of systemic and cerebral thromboembolism.<sup>18,19</sup> These antibodies may play a role in the development of lupus endocarditis and TTP.

### Nervous System

Tissue ischemia is the universal common denominator of the vasculitides. Even after the acute inflammation has resolved, ischemia may be sustained by fibrotic narrowing of the vessel wall.<sup>20</sup> The effects of ischemia on the nervous system range from subtle alterations in cellular metabolism,<sup>21,22</sup> to slowed impulse propagation and synaptic transmission,<sup>23,24</sup> to frank infarction. Variability in clinical expression can be explained by the acuteness of the ischemia, the extent of collateral circulation, and the degree of tissue sensitivity to hypoxia and ischemia. SLE is an important cause of cerebrovascular accidents in young people.<sup>25</sup> The accidents may result from several types of pathological events (Table 4). Classic cerebral infarctions with focal neurological deficits occur occasionally as the result of arteritis of medium-sized vessels to the cerebral cortices. In addition, emboli from Libman-Sacks vegetations, thrombotic occlusions related to the presence of the lupus anticoagulant, and intracranial hemorrhage may all induce profound neurological deficits. An interesting feature of this form of CNS lupus is that, in contrast with other manifestations of neurological SLE, cerebrovascular accidents more frequently occur as isolated events without evidence of disease activity elsewhere.<sup>26</sup>

Although the exact incidence is difficult to calculate, many investigators feel that intractable vascular headaches are among the most common of all neurological symptoms in patients with SLE.<sup>25,27,28</sup> These symptoms, in particular, can occur independently of disease activity. A recent study revealed that there is a threefold increase in the prevalence of classic migraine among SLE patients compared with an age- and sex-matched control group.<sup>29</sup> Interestingly, there was no correlation between classic migraine and Raynaud's phenomenon or other manifestations of SLE.

In addition to headaches resulting from vascular pathology, they may also be caused by meningeal irritation, psuedotumor cerebri, or inflammatory disease within the brain parenchyma.<sup>30</sup> Other neurological features may also be difficult to attribute to a single pathologic process or event. For example, deteriorat-

ing consciousness or coma may be caused by a vascular episode, may follow seizures, or may accompany cerebral inflammation. On the other hand, a single pathological event may have multiple etiologies. Vascular episodes such as stroke and subarachnoid hemorrhage may result from chronic renal disease and hypertension or as a result of cerebral arteritis. Some authors, however, have described SLE patients whose initial presenting features were those of cerebrovascular accident or subarachnoid hemorrhage.<sup>31,32</sup> Particularly prior to the advent of corticosteroid therapy, lupus vasculitis involving the central nervous system was a common terminal event.<sup>5</sup> In the fifty-three patients who died in the study of Estes and Christian, CNS involvement accounted for or contributed to death in eleven patients.<sup>9</sup> Seven of these patients had evidence of diffuse cerebral vasculitis and four had cerebrovascular accidents. In our experience, postmortem examination of the CNS was performed in seven patients with neuropsychiatric lupus.<sup>33</sup> A massive intracerebral hemorrhage with secondary necrosis was found in one case. In two, multiple large and small infarcts were noted. In one of these, inflammatory cells were present in the walls of medium-sized vessels; perivascular infiltrates were found around small arterioles. No vascular changes were described in the other case. The other patients in whom vascular changes were noted included one in whom multiple areas of microscopic degeneration were associated with small vessel congestion. Focal 1.5 mm areas of discoloration were noted grossly in one case but were not explained microscopically. Mild frontal lobe atrophy was found in one patient with chronic organic psychosis. No pathologic changes were found on routine examination in one patient despite a florid CNS illness with psychosis and multifocal neurological signs.

In the study reported by Bresnihan, pathological examination revealed no single characteristic lesion.<sup>30</sup> Only ten patients had significant gross lesions: three with a large intracerebral hemorrhage, one with multiple pontine hemorrhages, two small fresh hemorrhages, four with small areas of old infarction, and one with an incidental small subpial hemorrhage. Microscopic abnormalities were much more common and evidence of microinfarcts, often multiple, was seen in twenty of the twenty-four cases. No evidence of emboli was found. Furthermore, true arteritis was only seen in three cases. Other reports describing CNS vasculitis in SLE<sup>34,35</sup> failed to state the diagnostic criteria or based the diagnosis on nonspecific changes such as intimal proliferation or perivascular lymphocytes. Although the low incidence of active CNS vasculitis in SLE may be attributable to glucocorticoid treatment, lesions consistent with healed vasculitis were also uncommon. In spite of its rarity at postmortem examination however, CNS vasculitis is still commonly reported in patients with this disease. Indeed, in seventeen of fifty patients, the clinical diagnosis was CNS vasculitis, al-

though it was not found at autopsy.<sup>17</sup> The absence of CNS vasculitis or other neuropathological findings in many patients with SLE who had psychiatric and seizure disorders has suggested that another mechanism (e.g., antineuronal antibodies<sup>36</sup>) must be responsible for abnormalities.

Mintz and Fraga found evidence of CNS disease in five of six SLE patients with widespread arteritis.<sup>37</sup> True vasculitis, with infiltration of all layers of the vessel wall, has been an infrequent neuropathological finding.<sup>35</sup> However, careful pathologic studies by Johnson and Richardson support the concept that "SLE of the nervous system is, in most cases, a vascular disease involving very small vessels."<sup>35</sup>

The higher five-year survival rate for patients with functional psychoses as compared with patients with organic mental syndromes, along with the reported lack of correlation between pathologic findings in the brain and the presence of functional psychoses,<sup>35</sup> suggests that these are related to an acute toxic state or adrenal corticosteroid therapy while the organic mental syndromes represent cerebral vasculitis.<sup>9</sup>

Also supporting the concept of vascular inflammation causing many of the nervous system findings was our finding of the strong association of cutaneous or visceral manifestations of vasculitis with neurologic and psychiatric illness.<sup>33</sup> The likelihood of neuropsychiatric disease secondary to SLE was 62 percent in patients with vasculitis as compared with 28 percent in those without this manifestation. When present in a patient with neuropsychiatric disease, vasculitis generally occurred along with the nervous system illness and occasionally preceded it. Only rarely, in two cases, did vasculitis appear subsequent to neuropsychiatric disease.

Cranial nerve abnormalities occur in 5 to 33 percent of patients with neuropsychiatric lupus.<sup>9,33,35</sup> Both nuclear and peripheral lesions of the cranial nerves have been described. In our experience, fifteen of fifty-two patients with neuropsychiatric lupus developed peripheral neuropathies in the absence of other etiologies. Ten developed mild to moderate sensory (eight) or sensorimotor neuropathies (two) with subacute evolution. Sensory features were predominant in the mixed neuropathies. More classical vascular inflammation involving the vasovasorum occurred in the remaining five patients who developed a multiple mononeuritis.<sup>33</sup> In a large series of autopsy cases, the most common finding was a bland vasculopathy similar to that of hypertensive encephalopathy.<sup>34</sup> On the other hand, true vasculitis, a common finding underlying other systemic features of SLE, was noted in only 7 percent of patients. Similarly, other large series have demonstrated degenerative and proliferative small vessel changes, such as endothelial proliferation, mild perivascular lymphocytic infiltrates, and vascular hyalinization.<sup>28,35</sup> Microinfarctions are frequently noted, but large infarctions are unusual. Therefore, while the underlying pathogenesis of most CNS events remains unclear,

microvascular injury appears to predominate in the majority of affected patients who have been studied pathologically. Several hypotheses have been suggested to explain such widespread microvascular injury.<sup>26</sup> Many have proposed that the neuropsychiatric findings in SLE are related to deposition of soluble immune complexes in the choroid plexus. Initial studies suggested a correlation between clinical CNS abnormalities and deposits of immunoglobulin in the choroid plexus.<sup>38</sup>

Focal vascular events, for example, may be responsible for many strokes, cranial neuropathies, or transverse myelitis, but they are much less likely to be the cause of organic brain syndromes, psychoses, or chorea. It is possible that each neurological manifestation could be induced by a different mechanism or combination of mechanisms, including immune-complex deposition, direct antibody-mediated damage, large-vessel vasculitis, and thrombosis.<sup>25</sup>

Evidence exists in experimental animal models of immune-complex disease that antigen-antibody complexes deposit in the choroid and microcirculation of the brain with subsequent rises in the cerebrospinal fluid (CSF) protein concentration, suggesting injury to the tight junctions that form the blood-brain barrier.<sup>39</sup> Therefore, it is possible that the simultaneous occurrence of vascular injury and brain-reactive antibodies may contribute to the pathogenesis of CNS lupus.

Because antineuronal antibodies are present in higher titer in the CSF of patients with active disease, it can be hypothesized that such antibodies gain access to the CNS after disruption of the choroid plexus or small cerebral blood vessels by immune-complex-mediated damage.<sup>25</sup>

Finally, there are increasing data suggesting that thrombosis may underlie, pathophysiologically, certain neurological events in SLE. Numerous investigators have identified a distinct subset of SLE patients who have circulating autoantibodies directed against complex lipid antigens, such as cardiolipin and the prothrombin-activator complex of the clotting cascade-lupus anticoagulant. These patients have been shown to have a markedly increased incidence of recurrent arterial and venous thromboses, recurrent abortions, thrombocytopenia and, in some patients, acute neurological events.<sup>25</sup>

In a review of fifty autopsied patients with SLE, neuropsychiatric disturbances were present in 74 percent and CNS lesions were present in half the patients.<sup>17</sup> Embolic brain infarcts occurred in ten patients with the cardiac source of the emboli being Libman-Sacks endocarditis in five patients, chronic valvulitis in two patients, and a mural thrombus of the left side of the heart in two patients. Clinical features of TTP developed during the terminal illness in fourteen patients, seven of whom also had pathologic evidence of TTP. Correlation between neuropsychiatric disorders and brain lesions could be made in approximately half the patients. Using current technology, the improved sensitivity of

magnetic resonance imaging (MRI) compared with that of computed tomography (CT) in the CNS, has been demonstrated in the majority of patients with noncalcified nonhemorrhagic brain lesions greater than 3 mm in diameter.<sup>40-43</sup>

Although MRI is quite sensitive, its specificity is limited. In most patients, it would not be possible to suggest a diagnosis of CNS lupus from radiographic findings alone, in the absence of clinical history. For example, it was often not possible to differentiate the focal white matter lesions seen in CNS lupus patients from those found in patients with ischemic disease or multiple sclerosis. However, in a small number of patients, the MRI findings alone can suggest a diagnosis of vasculitis -- for example, a young patient with multiple small gray and white matter lesions in multiple arterial territories.

### Lungs

Even when the lungs themselves are affected, many different pathological processes may occur. These include noninfective acute or chronic pneumonitis and vasculitis resulting variously in infarction, pulmonary hypertension, or pulmonary hemorrhage.<sup>44</sup> Pulmonary vascular involvement in SLE has been reported less frequently than pulmonary parenchymal changes. Baehr and associates found pathologic changes of the pulmonary vessels, particularly fibrinoid necrosis, in twenty-three autopsied cases of SLE.<sup>1</sup> In four of these, the right heart was enlarged. Fibrinoid necrosis of pulmonary arterioles was also described by Klemperer et al.<sup>2</sup> Acute inflammation involving small pulmonary arteries and arterioles was found in 19 percent of forty-four SLE patients autopsied by Gross et al.<sup>45</sup> Fayemi reported a detailed study of the pulmonary vasculature of twenty autopsied SLE patients.<sup>46</sup> The pulmonary vasculature was involved by both acute and chronic lesions of varying severity in eight of the twenty cases studied. Muscular arteries were most often and most severely affected. Fibrinoid necrosis and vasculitis were common. Chronic lesions consisted of intimal fibrosis, medial hypertrophy, alteration of elastic laminae, periadventitial fibrosis and, in one case, aneurysmal dilation. These changes were found variously in arterioles, arteries, and veins. The fibrotic and occlusive vascular lesions may account for the syndrome of unexplained breathlessness that occurs in SLE. In certain individuals, these lesions may progress to overt pulmonary hypertension.<sup>46</sup>

Pulmonary hemorrhage is a recognized manifestation of lung involvement in SLE. Eagen and his associates reported four such patients who had acute pulmonary involvement manifested by dyspnea, cough, hemoptysis, and bilateral pulmonary infiltrates.<sup>47</sup> Three of the four patients died. Immune aggregates were present in all large blood vessels in two patients and focal IgG deposits in a third. Demonstration of

complement component deposition was variable and generally less intense than that observed in the small arteries and veins. Cellular subintimal proliferation, intimal fibrotic plaques, and organized intramural thromboses were observed in many small blood vessels. The deposits were observed in the walls of small blood vessels, and were localized predominantly between the endothelial cells and the basal lamina.

The pattern of immunoglobulin and complement deposition in the lungs in these patients may give insight into the nature of the underlying vascular events. Immunoglobulin deposits appeared to be present in both the pulmonary and bronchial circulations. Thus, these deposits were present in the alveolar septa, in the capillary loops and adjacent interstitium, and in the walls of larger blood vessels and bronchioles. Conceivably, lung hemorrhage could have resulted from disruption of the alveolar septa, but structural damage to other components of the pulmonary or bronchial circulation may also have contributed.<sup>47</sup>

Pulmonary vascular abnormalities are usually related to the presence of pulmonary hypertension which is defined as a prolonged increase of the main pulmonary artery pressure. With increased pulmonary pressure and resistance to blood flow from the right ventricle, the clinical manifestations of right ventricular hypertrophy and cor pulmonale are realized. The pathology of pulmonary vessels in either primary or secondary pulmonary hypertension is similar, and includes medial hypertrophy of small arteries and arterioles, intimal and endothelial cell proliferation, intimal fibrosis and medial muscular hypertrophy, various dilatative lesions, encrustation of the elastica with hemosiderin and, rarely, a necrotizing arteritis.<sup>48</sup> Although pulmonary lesions are common in SLE, only a few patients develop clinical manifestations of pulmonary hypertension and right-heart failure.<sup>46</sup> Baehr et al found pathologic changes and right-heart enlargement while studying the pulmonary vasculature in four of twenty-three autopsied SLE patients.<sup>1</sup> Fayemi found evidence of pulmonary hypertension in eight of twenty autopsied cases of SLE.<sup>46</sup> Perez and Kramer reported four of forty-three cases in which pulmonary hypertension was a major clinical manifestation.<sup>49</sup> All four patients had symptoms and signs of pulmonary hypertension. The echocardiograph showed right ventricular enlargement, and all had pulmonary hypertension documented by cardiac catheterization. Raynaud's phenomenon was present in three of four patients; in one, a severe exacerbation shortly preceded the onset of pulmonary hypertension. It has been reported that extrapulmonic findings such as Raynaud's phenomenon are frequent in those patients with primary pulmonary hypertension.<sup>50</sup> Nair et al<sup>51</sup> reported another case and mentioned the frequent association and its potential pathogenic role in primary pulmonary hypertension in SLE.

## Gastrointestinal Tract

The gastrointestinal manifestations of SLE were first emphasized by Osler in 1895.<sup>52</sup> "By exudative erythema is understood a disease of unknown etiology with polymorphic skin lesions -- hyperemia, edema, and hemorrhage-arthritis occasionally, and a variable number of visceral manifestations, of which the most important are gastrointestinal crises, endocarditis, pericarditis, acute nephritis, and hemorrhage from the mucous surfaces." Gastrointestinal crises (colic usually with vomiting and diarrhea) occurred in all eleven of his patients. Ten (19 percent) of the fifty-two patients reported by Harvey et al had arteritis involving the gastrointestinal tract.<sup>5</sup> In four, the lesions were in the esophagus; in three patients, in the small intestine; and in four patients, in the large intestine. In all cases there was associated ulceration of the underlying mucosa.

Acute abdominal syndromes have been increasingly recognized as the consequence of intra-abdominal vasculitis in patients with SLE.<sup>53</sup> These complications are of particular concern, since numerous clinical entities may simulate disease-related abdominal involvement. As reported earlier, bowel perforation consequent to mesenteric arteritis was the leading cause of death in SLE during the first four years of our Rheumatic Disease Unit's experience (Figures 1A and 1B).<sup>54</sup>

Eleven (73 percent) of the fifteen patients with SLE had exploratory laparotomy for acute abdominal events. Six of these patients had intestinal perforation, five colonic, and one in the small intestine. In general, small vessels were involved, resulting in discrete, localized lesions so that even in the one patient with multiple perforations, there were skip areas with normal-appearing bowel in between. Three patients had pre-perforations in that there was evidence of vasculitis but the bowel wall was still intact. Resolution of the abdominal

syndrome in these patients occurred with corticosteroid augmentation.

Thus, of the eleven patients with SLE requiring operative intervention, nine (82 percent) were found to have evidence of intra-abdominal arteritis. Only two had polyserositis without gross evidence of vasculitis at surgery. Four patients with acute abdominal syndromes promptly responded to corticosteroid augmentation alone, while surgery was being considered.<sup>55</sup>

Peripheral vasculitis (such as recurrent leg ulcers, splinter hemorrhages, and mucous membrane and digital ulcerations), central or peripheral nervous system involvement, thrombocytopenia, and circulating rheumatoid factor (latex 1:160) were significantly increased among those with acute abdomens (Table 5).

Since it is clear that, in contrast to other rheumatic diseases, SLE and periarteritis (PA) more frequently have disease-related abdominal crisis, it is important to recognize the clinical and laboratory features that suggest mesenteric arteritis and to delineate the clinical aspects of the abdominal syndrome which characterize and help differentiate it from other intra-abdominal disorders (Table 6). As previously pointed out by ourselves and Pollack et al, the diagnosis of an acute surgical abdomen due to SLE could be made with confidence only when the patient had concomitant disease activity in other organs.<sup>56</sup>

Table 5. Acute Abdominal Syndromes

Clinico-laboratory Feature	Abdominal (15 patients)	Non-abdominal (125 patients)
Peripheral vasculitis	57%	25%
CNS or PNS	67%	34%
Osteonecrosis	40%	14%
Thrombocytopenia	53%	19%
Rheumatoid factor positive	92%	45%

CNS = central nervous system, PNS = peripheral nervous system

\*Adapted from: Zizic TM et al. Acute abdominal complications of systemic lupus erythematosus and polyarteritis nodosa. *Am J Med* 1982; 73:525-31; and Reynolds JC et al. Acute pancreatitis in systemic lupus erythematosus: Report of twenty cases and a review of the literature. *Medicine* 1982; 61:25.

Twenty (8 percent) of 241 patients with SLE reported by Reynolds et al had acute pancreatitis.<sup>57</sup> The majority of patients had severe abdominal pain, nausea, vomiting, fever, and signs of adynamic ileus with abdominal distension and absent bowel sounds. Steroid therapy may be responsible for some of the cases, but the majority occur in the setting of active multisystem SLE and often with evidence of vasculitis elsewhere. When pathology is available, arteritis involving pancreatic vessels is usually present.<sup>58</sup>

Hepatomegaly occurs in 25 to 50 percent of patients with SLE during the course of their illness, and only infrequently is it accompanied by significant functional abnormalities, with jaundice occurring in approximately 5 percent of patients.<sup>58</sup> At postmortem examination, livers of SLE patients may be infiltrated with fat and contain areas of pericentral necrosis. Only rarely are the vascular lesions of SLE seen in the portal areas. Fatty changes were present even before corticosteroid therapy was available, as the pathological findings in the livers of eighteen autopsied lupus patients were slight to moderate with fatty degeneration in six.<sup>59</sup> Similar findings were noted by Harvey et al, since the most common finding histologically was fatty infiltration with, and atrophy and necrosis of, the central hepatic cells.<sup>5</sup> In only two instances were vascular lesions of SLE noted in the portal areas. Several other cases in which small and medium-sized hepatic arteries showed moderate to severe narrowing produced by proliferation of intimal connective tissue have been reported.<sup>2,60</sup>

### Kidneys

In our experience, clinical renal involvement occurs in approximately half the patients with SLE.<sup>33</sup> The alteration thought to be pathognomonic is the so-called wire-loop lesion, present in about 60 percent of the autopsied cases reported by Harvey et al.<sup>5</sup> It con-

sists of an irregularly thickened basement membrane which stains intensely with eosin. It may involve only a single capillary loop or there may be a number of such lesions. The extent of the lesions varies greatly, and whether or not renal insufficiency develops, probably depends on the number of glomeruli involved.

The most frequent microscopic alteration is an endothelial proliferation in the glomerular capillaries which may be mild or severe, leading to occlusion of the vessel and, if extensive enough, to the development of renal insufficiency.<sup>1</sup> Another lesion of fairly common occurrence is focal necrosis of the capillary tufts, frequently associated with hyaline thrombi. These lesions have been interpreted as an exaggerated or extreme form of the wire-loop lesion.

The kidney of malignant nephrosclerosis may be confused with that of lupus erythematosus.<sup>2</sup> However, the severe vascular lesions in the former condition, which are conspicuous in other organs as well as in the kidneys, must be compared with those in lupus erythematosus. In both diseases, necrosis of arterioles is found. In malignant nephrosclerosis, arteriolar necrosis is either associated with or preceded by a homogeneous hyalinization of the entire vessel wall. Early necrosis becomes evident by the migration of red blood cells into the homogenized vessel wall, and definitive necrosis, characterized by actual hemorrhagic infarction of the vessel itself, supervenes. An indistinguishable end result may be established in lupus erythematosus not by necrosis within an already hyalinized vessel, but by fibrinoid necrosis occurring in a previously normal vessel.

### Miscellaneous

Dermal vasculitis developed in thirty-one of 150 patients, progressing to chronic ulceration in fourteen and gangrene in two.<sup>9</sup> In our experience, peripheral vasculitis was present in thirty-nine (28 percent) of 140 patients and included recurrent (often refractory) leg ulcers, digital ulcers (Figure 2), mucous membrane lesions, splinter hemorrhages, and skin eruptions often characterized by tender indurated lesions.<sup>33</sup> Purpura is often non-thrombocytopenic in origin. Thus, of 100 patients with SLE seen at the Mayo Clinic, purpura was noted in ten; in all instances, it was thought to be vascular in origin.<sup>45</sup>

While fibrinoid degeneration is the most spectacular expression of this alteration in lupus erythematosus, the disturbance may also, to a lesser degree, manifest itself in sclerosis of collagen. This is particularly evident in the splenic lesions, and was present in nineteen of twenty autopsied patients.<sup>2</sup> This is a peculiar periarterial fibrosis limited to the central and penicilliary arteries. In cross sections of these vessels, the fibrosis assumes a pattern of concentric rings of stout collagen fibers, with few intercalated fibroblasts. The distinctive pattern clearly precludes confusion with trabeculae that bear arteries. The rings are apparently

**Figure 2.** Digital vasculitis with distal gangrene

formed by slow collagenization of adventitial reticulum fibers. The earliest reference to this nearly pathognomonic periarterial fibrosis or onion skinning of splenic arteries in SLE is that of Libman and Sacks.<sup>15</sup>

A number of vascular alterations in the eye can be seen, including hemorrhage, embolic petechias, perivasculitis, and retinal arterial occlusion.<sup>5</sup> Arteritis or phlebitis of the small vessels is seen in muscles and cannot be distinguished with certainty from that seen in periarteritis nodosa and rheumatoid arthritis.<sup>5</sup>

Livedo is the term first used to describe a violet discoloration of the skin due to a local circulatory disturbance.<sup>6</sup> The skin of the thighs, shins, and/or forearms is most often affected. As the name implies, it has a reticular or flattened cobblestone appearance, with areas of clinically normal skin encircled and demarcated from adjacent areas by a narrow livid blue or red band.

Livedo occurs as a result of disordered blood flow through subpapillary and dermal blood vessels. It may occur as a physiologic reaction to cold exposure and in such diverse states as connective tissue disease, polyarteritis nodosa, cold agglutinin disease, cryoglobulinemia, and Sneddon's syndrome.<sup>61-65</sup>

Sneddon first described the rare syndrome of livedo reticularis and cerebrovascular disease in 1965.<sup>65</sup> Characteristically, the cerebrovascular disease develops at a relatively young age, often in a multifocal pattern, and in an otherwise healthy person. Although biopsy material was not available from this patient, Sneddon postulated that arteritis obliterans was the common underlying pathologic event.

The association between livedo reticularis and cerebrovascular disease, originally described by Sneddon in otherwise healthy individuals, also applies to lupus patients.<sup>66</sup> Elevated anticardiolipin antibody levels (ACLA) were present in 81 percent of lupus patients with livedo reticularis as compared with 15

percent in the livedo-negative SLE patients. A history of thrombosis and thrombocytopenia -- clinical associates of anticardiolipin antibody -- were also significantly more common in SLE patients with livedo reticularis.

In the past few years, attention has been focused on the possible relationship between some of the clinical manifestations of SLE and the presence of antibodies to phospholipids.<sup>67-72</sup>

Recurrent fetal loss, venous thrombosis (particularly when recurrent), thrombocytopenia, hemolytic anemia, and leg ulcers were found to associate with ACLA, albeit somewhat less strongly. Anticardiolipin antibodies may also play a role in the development of Libman-Sacks endocarditis and TTP in SLE.<sup>17</sup> In one study, fourteen (28 percent) of the patients had a clinical profile consistent with TTP late in their illness.<sup>17</sup> The diagnosis of TTP was made if four of the five following features developed in the last two months of the patient's life: (1) MAHA, (2) thrombocytopenic purpura, (3) renal dysfunction, (4) neurological signs and symptoms, and (5) fever.

The clinical differentiation of TTP from the underlying illness or disseminated intravascular coagulation (DIC) in patients with SLE may be difficult. The diagnosis of TTP should be considered in any patients with SLE in whom there is rapid deterioration in multiple systems in association with MAHA. MAHA is the only component of the TTP pentad that is not characteristic of SLE.<sup>73</sup> However, MAHA may develop in patients with widespread small vessel disease such as systemic vasculitis, malignant hypertension, and DIC.

Johnson and Richardson reported that three (12.5 percent) of their twenty-four patients died of "acute CNS disease" with wide-spread cerebral vascular changes of TTP.<sup>35</sup> In another series, an antemortem diagnosis of TTP was made in only one patient; in the other thirteen, the clinical diagnosis included exacerbation of SLE, DIC, and vasculitis.<sup>17</sup>

Raynaud's phenomenon occurs in 21 to 23 percent of patients with SLE.<sup>9,33</sup> It is often an early manifestation and, generally, is non-progressive. We previously have demonstrated an increased incidence of vasculitis and Raynaud's phenomenon in SLE patients with ischemic necrosis of bone.<sup>74,75</sup> We believe that both Raynaud's phenomenon and vasculitis may cause a decrease in extraosseous blood flow. Interestingly, we have recently demonstrated that the increase in bone marrow pressure in two patients was decreased with the administration of a calcium channel blocker.<sup>76</sup>

### Pathogenesis

Although the immunological mechanism causing the various types of vasculitis are incompletely understood, there are three basic types: (1) passive deposition of immune complexes; (2) direct antibody attack on the vessel; and (3) cell-mediated immune mechanisms (T-cell/endothelial cell interactions) which pre-

sumably underlie most clinical types of primary vasculitis.<sup>20</sup>

Despite their presence in the circulation, immunoglobulin and complement are not generally found in vessel walls *in vivo*. Therefore, normal endothelium appears to have a limited capacity to interact with either immune complexes or complement. However, in SLE and other forms of vasculitis, high titers of autoantibodies and immune complexes persist in the circulation, and immunoglobulin and complement are found in vessel walls.<sup>77,78</sup>

Immune complexes in the vessel wall can be identified by immunofluorescence early, but are usually removed by neutrophils within twenty-four to forty-eight hours.<sup>20</sup> Subsequent activation of complement initiates immune adherence reactions including release of chemotactic factors, anaphylatoxins (C3a and C5), and formation of the membrane attack complex.<sup>79</sup> Infiltrating neutrophils bind to the complexes. There is phagocytosis and release of enzymes, inflammatory peptides, and oxygen radicals.<sup>80</sup> The generation of peroxide and hydroxyl radicals is important in the mediation of injury.<sup>81</sup> Mononuclear cells and plasma cells appear later.<sup>20</sup>

Immune-mediated tissue damage is a complex and dynamic sequence of events.<sup>48</sup> These events can be simplified into three stages, the first of which is that of immune complex formation. This is dependent on the ability of the host to recognize the putative antigen as foreign and thus elicit a humoral immune response. The nature of the response is critical, since factors such as the class and quantity of antibody produced, as well as the avidity of the immune response, will all be important factors in the resultant size of the immune complexes. Size appears to be a critical factor not only in regional deposition of the immune complexes but also in the ability of the reticuloendothelial system to clear them from the circulation. The nature of the antigen is important since this will determine the rate at which the host will endogenously metabolize its rate of clearance.

The larger sized lattices are more effective in activating complement and mediating the immunopathological effects. Complexes in great antibody or antigen excess are much less toxic than those formed at equivalence. The antibody type and subclass determine subsequent tissue damage.<sup>82,83</sup>

The factors governing immune complex deposition appear to be at least equally, if not more, complicated. The role of hydrostatic forces and the release of vasoactive substances appear to be critical factors in determining the target organ of immune complex deposition. Factors such as size of the immune complex, the charge of the complex, and the nature of the antigen also appear to be important factors in deposition.<sup>48</sup>

Immune complex clearance appears to be the final kinetic factor that determines duration of exposure to the complexes. For the most part, immune complexes are readily cleared by the reticuloendothelial system

through interaction with Fc and, to a lesser extent, C3b receptors.<sup>48</sup>

Animals that produce low titers of antibodies in response to antigen demonstrate a degenerative vasculopathy associated with the deposition of immune complexes in the vessel wall. Animals that produce higher levels of antibody show a more prominent cellular response.<sup>20</sup>

Murine models of SLE develop varying levels of vascular disease. MRL/lpr mice are prone to a necrotizing vasculitis; other mice, including NZB/W FI and BSXB strains, more frequently develop a degenerative vasculopathy. Serologic analysis reveals that the vasculitis in the MRL/lpr is associated with the relatively late development of high levels of autoantibodies and circulating immune complexes. Degenerative vascular disease in the other mice is associated with early onset of autoantibody production of low magnitude, giving rise to persistently low levels of circulating immune complexes.<sup>84</sup> This may well be similar to SLE in humans; in association with chronically circulating immune complexes, a degenerative vasculopathy occurs although, less often, vasculitis may also be seen.<sup>85</sup>

Another study of the MRL/1 mouse strain has found IgG-rheumatoid factors complexed with IgG-anti-deoxyribonucleic acid (DNA) in this murine model. These investigators suggest that these rheumatoid factors and antinuclear antibodies, singly or in combination, may be pathogenetic for the inflammatory lesions.<sup>86</sup> Whether or not thrombocytopenia is a feature of this murine syndrome has not been studied. Such would be of interest, however, in view of the observations of Yeatts et al showing release of vasoactive amines from platelets exposed to insoluble complexes.<sup>87</sup>

The clinical association of rheumatoid factor in high titer in rheumatoid arthritis patients with vasculitis has been shown by many.<sup>88-92</sup> A variety of anti-gamma globulin factors has been implicated in the pathogenesis of rheumatoid vasculitis, including conventional 19S rheumatoid factor,<sup>88</sup> a low molecular weight IgM,<sup>93</sup> an IgG with antiglobulin activity,<sup>93</sup> and cryoprecipitable antigamma activity.<sup>94</sup> Numerous experimental studies have also implicated IgM rheumatoid factors in vascular damage. Baum et al demonstrated that rheumatoid factor reacting with antigen-antibody complexes is deposited on endothelium when infused in rat mesentery, suggesting that the deposition of rheumatoid factor mediates vasculitis.<sup>95</sup> One may wonder if analogous to this experimental model of mesenteric arteritis, such factors affected the patients we reported with bowel perforations secondary to vasculitis.<sup>53,54</sup>

Although most attention has been focused on DNA-anti-DNA immune complexes, in some patients, other antibody systems may be responsible for the vasculitis. The presence of anticomplement antibody has usually been associated with the CREST (calcinosis, Raynaud's phenomenon, esophageal dysfunction, sclerodactyly, telangiectasis in scleroderma) variant of scleroderma.<sup>96</sup>

Although it occurs in only 1 percent of patients with SLE, two of three recently reported lupus patients with this antibody had digital vasculitis.<sup>97</sup>

Endothelial cells enclose lymphocytes within the vascular space. The same endothelial cells also emit signals that direct the traffic of lymphocytes to certain areas, present antigens, recruit inflammatory cells, affect coagulation, and permit passage of cells through the lining of the vessel wall into the tissue beyond.<sup>20</sup> Moreover, since these cells are in direct contact with circulating antibody, immune complexes, complement, and effectors of cell-mediated immunity, immune injury to endothelial cells may play a role in the pathogenesis of several immune vascular disorders, including SLE.<sup>77</sup>

IgG anti-endothelial antibodies have been demonstrated in the sera of patients with active SLE.<sup>77</sup> These sera may also contain IgG complexes capable of binding to endothelial cells. Binding of SLE-IgG and heat aggregated-IgG to endothelium initiated complement activation, deposition of the third component of complement, secretion of prostacyclin from endothelial cells, and adherence of platelets, confirmed by scanning electron microscopy.<sup>77</sup> More recently, autoantibodies to vascular endothelial cell antigens were detected in eighteen of twenty-one patients with SLE in the study.<sup>98</sup> This autoantibody was highly cytotoxic, complement-fixing, and specific for antigens on the surface of the vascular endothelial cell.

Additionally, and perhaps centrally in some vasculitides, the endothelium releases the mediators governing chemotaxis and adherence of leukocytes, changes in structure and permeability of the vessel wall, and molecular and cellular transport across the endothelial cell barrier.<sup>20</sup> Cytokines such as interferon, interleukin-1, and tumor necrosis factor, released during the inflammatory response, increase class II expression by the endothelial cells, thereby recruiting more inflammatory cells. Interleukin-1 and other cytokines also induce thromboplastin, prostacyclin, and platelet-activating factors from endothelial cells, resulting in altered vascular permeability and thrombosis.<sup>99</sup>

# Succeed In The 90's With

# SMART C·H·A·R·T

## Computerized Medical Records

Did you know that most doctors spend about 40% of their time recording and trying to decipher patient histories from traditional Medical Charts?

Smart Chart's unique software package affords quick and easy access to medical records.

By using Smart Chart, you will have more time to...

- See patients
- Conduct research
- Enjoy yourself!

Call Smart Chart, Inc. today and see how easy it is to *Succeed in the 90's with Smart Chart!*

MAIL OR FAX THIS COUPON TO:

Smart Chart, Inc.

11212 Grandview Avenue, Suite 108

Wheaton, Maryland 20902

# You Will Affect the Future of Medicine

## The Medical Manager<sup>®</sup> can affect the future of your practice.

The nation's #1 selling software (more than 10,000 systems installed nationwide) helps you in numerous ways.

- ♦ Filing claims electronically means you get payment faster.
- ♦ Increases staff efficiency.
- ♦ You have automated recall notices.
- ♦ Patient demographic data can help your practice grow.

The Medical Manager<sup>®</sup> is available for as little as \$250. per month on a lease/purchase option.

Call and we'll come to your office, review your needs, and prepare purchase and lease estimates with NO OBLIGATION. Once we install The Medical Manager<sup>®</sup> we'll train your staff and provide *on-going support* when you need it.

**CALL TOLL FREE**

# Autoantibodies and SLE

---

Carol M. Ziminski MD

---

*Dr. Ziminski is Assistant Professor of Medicine, The Johns Hopkins University School of Medicine, Baltimore, MD.*

---

*Systemic lupus erythematosus is characterized by an enormous and increasing array of antibodies to cellular constituents. These autoantibody phenomena are not diagnostic in themselves but must be interpreted within the context of the individual clinical situation.*

---

Systemic lupus erythematosus (SLE) may be considered the prototype of autoimmune disease. The diagnosis of SLE is often a clinical one, based on the patient's history, physical examination, and clinical course. The catalog of known autoantibody specificities in SLE is large and growing. Table 1 represents a partial list of known autoantibodies. The presence or absence of particular autoantibodies may influence the confidence with which this diagnosis is made.<sup>1</sup> The relationship between autoantibodies and the clinical manifestations of SLE is not entirely clear. The circumstantial evidence that antibodies are responsible for clinical disease is powerful, and yet there is meager direct evidence implicating autoantibodies in immunopathogenesis of the clinical disease. The detection, clinical relevance, and characterization of the most extensively studied autoantibodies in lupus patients are presented here, as well as some of the theoretical ideas of how autoantibodies participate in the pathogenesis of lupus.

The contention that autoantibodies are themselves important in disease expression is consistent with the following evidence.<sup>2</sup> First, antibodies in the serum are associated with particular clinical manifestations. Second, the finding of immunoglobulin deposition in tissues of patients is consistent with these antibodies being pathogenic. Third, in individual patients, antibodies with particular specificities have been shown to be concentrated in tissues affected by the disease. Fourth, the close association of congenital problems such as complete heart block and neonatal lupus dermatitis with particular maternal autoantibodies suggests the participation of maternal immunoglobulin G (IgG) transported across the placental membranes. Finally, an ingenious animal model has shown that the capacity of antibodies to deposit in human skin is dependent upon the specificity of the antibody.<sup>3</sup>

The following discussion of autoantibody phenomena is not exhaustive and techniques are described for only the most important and frequent tests. One current nomenclature convention is that antigen-antibody systems are named after the patient in whom the antigen or antibody was discovered. The first two letters

**Table 1. Autoantibodies in SLE**

Antibody System	Prevalence in SLE (%)	Clinical Associations	Other Disorders	Laboratory Associations
ANA	90-95	Non-specific	Many (RA, Sjogren's,...)	None
Anti-dsDNA	40-60	Nephritis	Rare	Hypocomplementemia
Anti-ssDNA	90-95	None	Many	None
Anti-Sm	25-35	Isolated CNS disease	None	Anti-nRNP
Anti-nRNP	40-50	Raynaud's, myositis	Overlap syndrome	Anti-Sm
Anti-Ro	25-40	Sicca, photo sensitivity	SCLE, homozygous C <sub>2</sub> deficiency, Sjogren's Neonatal lupus	Hyperglobulinemia rheumatoid factor, less ANA, anti-DNA Maternal antibody
Anti-histone	30-40	Drug-induced lupus (95%) Idiopathic lupus (30-40%)		Other ANAs absent Other ANAs present
Anti-phospholipid	(?)	Thrombosis (arterial, venous), fetal loss		BFP-STs, lupus anticoagulant, anti-cardiolipin

CNS = central nervous system, BFP-STs = biologic false positive - serologic test for syphilis, ANA = antinuclear antibody, RA = Rheumatoid arthritis, SCLE = subacute cutaneous lupus erythematosus

of the patient's last name are identified; thus, there are anti-Sm, anti-Ro, and anti-La antibodies. An alternate convention is to name the autoantibody system after the disease in which it is most frequently found; thus, there is anti-SS-A, so termed because of its presence in Sjogren's syndrome. Once the molecular nature of the antigen is known, the name may be modified to reflect this, as in the anti-DNA (deoxyribonucleic acid) and anti-nRNP (nuclear ribonucleoprotein) systems.

### Lupus Erythematosus Cell Phenomenon

The recognition of the lupus erythematosus (LE) cell<sup>4</sup> was a landmark observation which initiated the study of antibodies to nuclear antigens. The LE cell is a complex phenomenon that depends on the presence of a specific factor in serum or other body fluids -- that is, an antibody that reacts with nucleoprotein (particularly histones) from the nuclei of damaged cells. As a result of this interaction, the nuclear material is altered and becomes chemotactic for polymorphonuclear leukocytes that surround the nuclear material to form rosettes. Phagocytosis (primarily by neutrophils -- less often by eosinophils, monocytes, lymphocytes, or plasma cells) leads to the formation of the LE cell. It was long believed that the LE phenomenon was solely an *in vitro* phenomenon, but it is now evident that LE cells can be found *in vivo*, particularly in extravascular areas such as the synovial fluid and pleural fluid. Cells breaking down in these areas provide nuclei available for phagocytosis. In tissues, the LE inclusion material is believed to have its counterpart in the hematoxylin body.

This test has relative specificity for SLE (65 to 98 percent), although LE cells may be seen in other disorders, but it is not a sensitive assay (50 to 90 percent) and, as such, is not particularly useful as a screening test.<sup>5,6</sup>

The LE test, although still performed in many laboratories, is being replaced by tests that are more sensitive and specific. The important information that the LE cell test provides is that the patient has antibodies to whole desoxyribonucleoprotein or histones. With available modern technology, more sophisticated assays can be employed to detect this and other autoantibodies.

### Antinuclear Antibody

The term antinuclear antibody (ANA) is a generic one referring to the universe of autoantibodies reactive with nuclear antigens. The indirect immunofluorescent test is considered to be the most reliable screening test for ANA and for SLE.<sup>7,8</sup> Antinuclear antibodies appear in almost all patients with SLE, as well as in a variety of other conditions including older age. The ANA test is performed by first fixing a cell substrate to a microscope slide. (Animal organs such as mouse liver or human cell cultures are most frequently used). A dilution of patient serum is then placed on the slide, which leads to attachment of immunoglobulin (Ig) molecules with antinuclear specificity. The cells are subsequently stained with fluorescein-conjugated antibody against human immunoglobulin. Fluorescence microscopy is used to demonstrate the presence of fluorescence (reflecting binding of the fluorescein-tagged antihuman Ig) and the pattern of fluorescence.

The sensitivity of the test depends upon the tissue substrate used. When cell culture lines (e.g., Hep2) are used as the tissue substrate, the ANA titer for any given sample is higher than if animal organs (e.g., mouse liver, rat kidney) are used.<sup>9</sup> A positive test can alert the clinician to a variety of antibodies that are of interest for future study.

Reports of ANA tests commonly include titer and pattern. It is important that serum be titrated in order to provide a semiquantitative value to the level of antibody present in the serum. Four basic patterns of ANA immunofluorescence have been recognized (Table 2), which may be helpful in delineating clinical subsets.<sup>2,6,10,11</sup> More than one pattern may occur in an individual patient, suggesting that more than one antibody system is present.

1. *Homogeneous* (diffuse) staining is produced when antibodies react with the entire nuclear substance (antibodies to desoxyribonucleoprotein -- anti-

**Table 2. ANA Patterns of Immunofluorescence**

Pattern	Molecular Association	Clinical Association
Homogenous (diffuse)	DNP, histone (+ LE cell)	SLE, RA ...
Peripheral (membranous)	Native (double- stranded) DNA	SLE ...
Speckled	ENA: Sm, nRNP; Ro, La	SLE, SS, Sjogren's
Nucleolar	Nuclear RNA-protein	SS ...

DNP = desoxyribonucleoprotein, RA = rheumatoid arthritis,  
ENA = extractable nuclear antigen, SS = systemic sclerosis

DNP). It is this antibody to nucleoprotein that produces the LE phenomenon under appropriate conditions. This pattern is the most common one, but also the least specific. It may be seen in 10 to 70 percent of rheumatic diseases (especially SLE and rheumatoid arthritis), as well as in other conditions such as chronic active hepatitis.

2. A *membranous* or peripheral pattern (rim, ring) is generally produced by antibody to native (n) or double-stranded (ds) DNA. This pattern is most frequently seen in patients with active SLE, particularly those with renal disease. The presence of antibodies to DNA (anti-DNA) can be confirmed by further studies with specific DNA substrates (discussed below).
3. *Speckled* staining represents antibodies to a group of substrates which are saline-soluble and easily extractable from nuclei. This pattern is the expression of a variety of antigenic specificities, a few of which have now been characterized. These antigens as a group have been referred to as extractable nuclear antigens (ENA). Speckled staining can be seen in a variety of disorders, including SLE, rheumatoid arthritis (RA), systemic sclerosis (SS), Sjogren's syndrome, and overlap syndromes with mixed features of several disorders.
4. A *nucleolar* pattern is rare and results from specific staining of nucleoli by antibody. It is often associated with other patterns. The antigenic activity has been attributed to a low molecular weight ribonucleic acid (RNA)-protein.

It must be emphasized that these patterns are not specific for disease-association, and may indeed vary depending on the testing technique (substrate) used. The fluorescent ANA test is not standardized as to the type of antigenic substrate or conjugated antiserum used, nor is there a universal criterion for a positive result. A discrepancy in results from different laboratories is usually the result of different test methods. Furthermore, 3 to 5 percent of SLE patients who are ANA-negative may have at least one positive result if their serum is tested on multiple antigenic substrates.

Disparate results from different clinical laboratories must be evaluated and reconciled. The clinician should be more persistent in pursuing a negative ANA result in the face of impressive clinical data for SLE than in

being concerned about a positive result accompanying limited or nonspecific clinical findings. The first situation could be due to variations in ANA testing, or may reflect the presence of unusual autoantibodies. The second situation requires continued observation of the patient. It must be emphasized that the ANA is *not* the "lupus test." That is, a positive ANA does not mandate the diagnosis of SLE.

Positive ANA test results are found in up to 10 percent of patients with discoid lupus erythematosus without systemic involvement. A positive ANA may portend the development of such involvement in some but not all patients. Because the frequency of low-titer ANA positivity increases with age in the normal population, a positive ANA is much more significant in a young patient with discoid LE than in an older one.<sup>11</sup>

A negative test for ANA occurs in about 5 percent of patients with otherwise typical SLE. Almost two-thirds of these patients have serum antibodies to Ro or La or both. Of the remainder, the great majority have antibodies to single-stranded DNA (ssDNA) demonstrable by radioimmunoassay (RIA).<sup>12</sup> The presence of these autoantibodies tends to be confirmatory but must be accompanied by clinical findings consistent with SLE in order to establish the diagnosis of SLE.

Antinuclear antibodies may decrease in titer or become undetectable following treatment of SLE. In general, however, the ANA test is not an accurate reflection of disease activity and, by itself, has little prognostic value.

In summary, the ANA test is a highly sensitive test of low specificity. It is useful as a screening test. A negative test is strong evidence against the presence of disease, while a positive test does little to establish a specific diagnosis, although the test is positive in ~95 percent of patients with SLE. Other techniques have been used to characterize further the autoantibodies seen in SLE and other diseases.

### Antibodies to DNA

Antibodies to DNA (anti-DNA) have been of central interest in the immunology of SLE since their discovery by several groups of investigators in the late 1950s.<sup>13-15</sup> The development of serologic methods has led to increasing sensitivity and precision in the detection of these antibodies. Current methods allow detection and quantitation of antibodies to both nDNA or dsDNA and ssDNA. Immunofluorescence on *Critidia* substrate measures only anti-dsDNA, as *Critidia luciliae* is a trypanosome-like organism, the kinetoplast of which contains a high concentration of dsDNA.<sup>16</sup> Alternate methods employing RIA and enzyme-linked immunosorbent assay (ELISA) techniques are readily adapted to measure either anti-ssDNA or anti-dsDNA.<sup>17,18</sup>

Antibodies to dsDNA are very specific for SLE and may fluctuate with disease activity.<sup>19</sup> Such antibodies may be a harbinger of renal disease, particularly when

associated with hypocomplementemia. There is considerable evidence for an important pathogenic role for the antibody itself or dsDNA-anti-dsDNA immune complexes in the clinical expression of disease, but details of the mechanism remain unexplained. The predominant theories of renal injury are that preformed immune complexes deposit directly in the glomerulus, that DNA is trapped and bound *in situ* by the anti-DNA antibody, or that anti-DNA binds directly to the basement membrane.<sup>20,21</sup>

Antibodies to ssDNA occur with even higher frequency in SLE than do antibodies to dsDNA, but are also observed in patients with other systemic rheumatic diseases and occasionally in normal persons. This antibody, therefore, has little diagnostic specificity. However, this should not be interpreted to mean that anti-ssDNA is pathogenetically unimportant. Indeed, it has been shown that anti-ssDNA can be eluted from the glomeruli of SLE patients and that it is present in the form of immune complexes in such tissue. In some patients with SLE, the level of anti-ssDNA may correlate with disease activity.<sup>6,11</sup>

### Antibodies to Nonhistone Antigens

A heterologous group of autoantibodies is characterized by reactivity with soluble nonhistone nuclear proteins and RNA protein complexes. Most of these acidic proteins are readily extractable in physiologic buffers. They can be detected by immunodiffusion methods using the appropriate antigen extracts and reference serum.<sup>2,6,11</sup> Precipitating lines representing different antibody systems can be demonstrated readily by Ouchterlony gel double-diffusion. There are four of these RNA-protein conjugate antigens, antibodies to which are made with substantial frequency in SLE patients: nRNP (40 to 50 percent), Sm (25 to 35 percent), Ro/SSA (25 to 40 percent), and La/SSB (10 to 15 percent).

*Antibodies to Sm and nRNP - the ENA complex.* The designation ENA originally referred to extractable nuclear antigen which reacted with serum from SLE patients. It has become clear that many nuclear antigens, particularly nonhistone antigens, are readily extractable. By common usage, the term ENA now generally designates two nonhistone antigens -- Sm and nRNP.<sup>22</sup>

The Sm antigen is a nonhistone protein which is not dependent on DNA or RNA for its antigenicity. Anti-Sm binds to a group of ribonucleoproteins associated with small nuclear uridine-rich RNAs. The antibodies to nuclear ribonucleoprotein (anti-nRNP) are partially related to Sm immunologically. The particle bound by anti-nRNP is also composed of an RNA component designated U1 (for uridine-rich), complexed to a group of proteins, hence the alternate terminology anti-U1RNP. The frequent simultaneous occurrence of antibodies to Sm and nRNP has been noted, and immunochemical studies have shown that Sm and nRNP antigens associate in molecular complexes

referred to as small nuclear RNP (snRNP) complexes. There exists also a molecular form of Sm free of nRNP.<sup>2,6,11,22</sup>

The clinical significance of antibodies to Sm and nRNP has received much attention. There is general agreement that antibodies to the Sm antigen are highly specific for SLE, although detected in less than one-third of patients.<sup>17</sup> To underscore its importance, anti-Sm antibody was included with antibody to dsDNA, the LE cell test, and a biologically false positive test for syphilis (BFP -- discussed below) as one of four sub-items in an immunologic criterion in the revised criteria for the classification of SLE.<sup>1</sup> No characteristic clinical features are apparent for this group of patients, although there have been reports that the nephritis of such patients is mild and follows a benign course.<sup>23</sup> Antibodies to Sm in the absence of other autoantibodies have been associated with isolated central nervous system disease in lupus.<sup>24</sup>

Antibodies to nRNP may be seen in ~40 percent of SLE patients, particularly those with Raynaud's phenomenon and myositis. Classically, patients with anti-nRNP have mild disease, a low frequency of antibodies to DNA, and a low frequency of clinically apparent renal disease.<sup>25</sup> These SLE patients with anti-nRNP develop nephritis only when antibodies of other specificities are present, notably anti-DNA.<sup>26</sup> Nephritis may also occur when anti-nRNP is associated with antibodies to Sm or Ro. It should be noted that anti-Sm and anti-nRNP have been reported with both increased and decreased frequencies of renal involvement in SLE.<sup>10,27,28</sup>

A group of patients with anti-nRNP and with overlapping features of SLE, scleroderma, and polymyositis has generated much discussion. It has been suggested by some that such patients be separated into a distinct group called mixed connective tissue disease.<sup>29</sup> The only uniform finding in these patients is, by definition, the presence of antibodies to nRNP, which also occurs in SLE patients without overlapping features. A substantial fraction of these patients develop systemic sclerosis or polymyositis, or eventually fulfill criteria for SLE, suggesting that anti-nRNP may not be a marker for a distinct clinical entity.<sup>30</sup> What is lacking is a fundamental understanding of etiology and pathogenesis of these disorders, after which the issue of nomenclature will be moot.

*Antibodies to Ro/SSA and La/SSB.* Autoantibodies to the soluble antigens Ro and La were originally described in patients with SLE and Sjogren's syndrome. These antigens are both RNA-protein conjugates which were thought to be cytoplasmic in origin, and were termed small cytoplasmic ribonucleoproteins (scRNPs). The Ro and La antigens have subsequently been shown to be identical to the nuclear antigens SSA and SSB.<sup>2,11,22</sup> Although all RNA is synthesized in the nucleus, much RNA is eventually found in the cytoplasm. Thus, the cellular localization of these antigens may vary with different stages of the cell cycle.

Anti-Ro autoantibodies may occur with anti-La. Nearly all patients with La precipitins also have Ro precipitins. Anti-Ro is also associated with rheumatoid factor, which may represent binding to similar structural features on Ro and immunoglobulin.<sup>2</sup>

Anti-Ro, with or without anti-La, appears in 25 to 40 percent of SLE patients.<sup>11</sup> It is of interest that anti-Ro is one of the most common autoantibodies found in normal individuals or in asymptomatic relatives of patients with rheumatic diseases. The anti-Ro antibody is often the major antibody system found in patients with ANA-negative SLE.<sup>12</sup>

ANA-positive, anti-Ro SLE patients often have prominent sicca features and photosensitivity. A high frequency of rheumatoid factor and hyperglobulinemia has been noted in 75 to 80 percent of these patients.<sup>31</sup> Within the subset of ANA-positive SLE patients who have anti-Ro, there are important clinical and serologic distinctions between patients who produce anti-Ro *alone* and those who produce *both* anti-Ro and anti-La.<sup>32</sup> There is great similarity in nonrenal findings in these two groups of patients, but the frequency and severity of renal disease differs significantly. More than half of anti-Ro positive patients have evidence of nephritis, but less than 10 percent of the anti-Ro and anti-La patients have such evidence. The serologic correlation of this difference in renal disease was the presence of anti-DNA in three-quarters of the anti-Ro group but in only one-third of the anti-Ro and anti-La group. The titers of both anti-dsDNA and anti-ssDNA were higher in patients with only anti-Ro than in those with both anti-Ro and anti-La.

The designation, subacute cutaneous lupus erythematosus (SCLE), identifies a variant of lupus with a characteristic nonscarring dermatitis.<sup>33,34</sup> Patients are often markedly photosensitive, and develop widespread annular and polycyclic skin lesions. Systemic features are mild. These patients are often ANA-negative, but two-thirds will have anti-Ro antibodies. The common factor shared by ANA-negative SLE patients and SCLE patients which may relate to their mild systemic disease and the low frequency of nephritis is the low frequency of antibodies to dsDNA.

It has also been reported that up to three-quarters of SCLE patients are DR3 positive, a significant increase above the control frequency for this particular human lymphocyte antigen (HLA).<sup>34</sup> These data suggest that a set of genetic determinants in the major histocompatibility complex (MHC) is associated with the production of anti-Ro.

Further data supporting a genetic influence on anti-Ro production emerge from a study of the most common hereditary deficiency of complement -- homozygous C2 deficiency.<sup>35</sup> The genes for C2 are known to reside in the MHC on chromosome 6. Approximately one-third of such patients develop a lupus-like syndrome marked by photosensitivity and widespread annular skin lesions like SCLE. Systemic features are not severe;

there are generally low or insignificant titers of ANA or anti-dsDNA. Anti-Ro may be present in up to 85 percent of these patients. Since all homozygous C2-deficient patients studied so far carry the DR2 antigen, it appears that antibodies to Ro can be associated with either DR2 or DR3.

The anti-Ro antibody system, seen in a variety of clinical situations, may have a special ability to initiate injury to skin, which may explain its close link to photosensitivity and the development of cutaneous lupus lesions.<sup>36</sup>

Evidence for anti-Ro antibodies being pathogenic comes from an additional source. Complete congenital heart block and cutaneous lesions, the major clinical features of neonatal lupus, are associated with antibodies to Ro or La or both in virtually every child and mother evaluated in this clinical setting.<sup>37,38</sup> Available pathologic specimens have shown subendocardial fibrosis and, occasionally, infiltration by inflammatory cells.<sup>39</sup> Subendocardial deposition of immunoglobulin and complement has also been documented.<sup>40</sup> Transplacental passage of maternal IgG anti-Ro antibody to the fetus cannot be the only causative factor. Neonatal lupus with congenital heart block has been reported in one fraternal twin born to an anti-Ro positive mother, but not in the other twin who also had anti-Ro antibodies.<sup>41</sup> The cutaneous features, with photosensitivity and annular lesions similar to those seen in SCLE, generally appear within the first two months of life. The dermatitis and the anti-Ro antibody disappear over the same six-month interval, suggesting the possible participation of anti-Ro in the pathogenesis of the dermal lesion. Only a minority of the mothers have SLE and most are asymptomatic, but the subsequent emergence of autoimmune disease has been reported.<sup>38,42</sup> Although the presence of anti-Ro antibody is a strong risk factor for the neonatal lupus syndrome, many normal babies are born to anti-Ro positive mothers.

A final note of genetic interest emerges from the study of a child with neonatal lupus in which both mother and daughter had antibodies to Ro and La.<sup>43</sup> HLA typing revealed the mother was DR3 and the child was DR2. The initially asymptomatic mother developed some evidence of Sjogren's syndrome seventeen months after delivery. Such data suggest that anti-body production in the mother, and clinical expression of disease in the infant, are controlled by independent factors.

The anti-Ro antibody system also occurs in Sjogren's syndrome. The presence of anti-Ro has been associated with extraglandular features such as vasculitis, with hematologic abnormalities, with hyperglobulinemia, with cryoglobulinemia, and with rheumatoid factor.<sup>44</sup> The antibody specificities are not as diverse as in lupus. Up to 95 percent of Sjogren's patients may have anti-Ro, while 85 percent or more may have anti-La.<sup>45</sup> The features of SLE and Sjogren's syndrome often overlap, and it should not be surprising if many of the

fundamental processes of the two disorders are eventually discovered to be similar.

### Antibodies to Histones

Histones are basic nuclear proteins that are integral molecular components of the nucleosome (DNA, histones). Antihistone antibodies classically produce a homogeneous pattern when demonstrated by immunofluorescence on routine screening for ANAs; positive LE cell preparations are frequently seen in this setting.

Antibodies to histone may occur in one-third of patients with idiopathic SLE, but occur in almost all patients with drug-induced LE.<sup>46</sup> The differentiation of drug-induced lupus from idiopathic SLE may present a clinical problem in a patient with features of lupus but no renal involvement. Patients with idiopathic SLE usually have ANAs with multiple immunologic specificities, as discussed above, which can include anti-histone antibodies. A patient with drug-induced lupus will have autoantibodies only to histone and an absence of other immunologic specificities.<sup>14,22</sup> Studying the complete ANA profile is thus important in this clinical setting.

Early reports in the 1940s and 1950s related probable drug-induced lupus syndromes to the administration of sulfonamides and penicillin. Since then, more than fifty agents have been implicated in this syndrome and its associated laboratory abnormalities.<sup>47,48</sup> Several mechanisms for these findings have been postulated, but no one mechanism has been established as pre-eminent. The clinical syndrome, when it does occur, is characterized by fever, myalgias, polyarthralgias, polyarthritis, and polyserositis (pleuritis, pericarditis, and peritonitis). The syndrome generally resolves on discontinuation of the drug, although the ANA may remain positive for months or even years.

Procainamide is the most frequent cause of drug-induced lupus. Approximately 50 percent of patients taking procainamide will become ANA-positive within one year; and one-half of these may develop clinical symptoms. Slow acetylators phenotypes are more likely to develop drug-related lupus at lower doses of the drug. Toxicity is not clearly associated with higher doses. The incidence of drug-induced lupus seems to be lower with the newer acetyl procainamide.

Hydralazine may cause a similar clinical syndrome to that seen with procainamide. This syndrome is also frequently seen in slow acetylators, is more common in women, and is seen more often in those possessing the HLA-DR4 antigen. Other agents have also been implicated in the development of drug-related ANA-positive lupus.

### Anti-phospholipid Antibodies

There has been intense research in recent years to evaluate the importance of antibodies to phospholipids (Table 3). These have been recognized since the turn of the century, when Wasserman described a type of

**Table 3. Phospholipid Antibodies**

Biologic false-positive test for syphilis (BFP-STS)  
(+) VDRL, (-) fluorescent antitreponemal antibody (FTA)

Lupus anticoagulant (LAC)

Prolonged aPTT

Russell viper venom time (RVVT)

Kaolin clotting time (KCT)

Anticardiolipin antibody (aCL)

antiphospholipid antibody (aPL), the reagent associated with syphilis. If a patient has a positive reaction to the Venereal Disease Research Laboratories (VDRL) test, but a negative fluorescent antitreponemal antibody (FTA), it is concluded that the VDRL is a biologic false-positive reaction. It subsequently became clear that there were two types of biological false-positive serologic tests for syphilis (BFP-STS): acute, usually associated with virus or other infection, and chronic, frequently associated with the presence of rheumatic disease.<sup>49</sup> The association with SLE is so strong that the American Rheumatism Association (renamed the American College of Rheumatology) criteria for SLE include the BFP-STS.<sup>1</sup> Antiphospholipid antibodies may occur without evidence of rheumatic disease in the primary anti-phospholipid antibody syndrome (PAPS).<sup>50,51</sup>

A circulating anticoagulant also is evidence of an antiphospholipid antibody. The lupus anticoagulant (LAC) was originally described in two patients with hemorrhagic complications -- and thrombocytopenia.<sup>52</sup> In the absence of thrombocytopenia, clinically significant bleeding does not occur, and these patients have the complications of a procoagulant state.<sup>53</sup> The term lupus anticoagulant is doubly paradoxical -- the phenomenon can be seen in non-SLE patients, and thrombotic events are prominent.

There are several assays that have been used to detect the LAC. The most sensitive assays seem to be the kaolin clotting time (KCT) and the Russell viper venom time (RVVT). The activated partial thromboplastin time (aPTT), probably the most frequently used test in clinical studies, is less sensitive than the KCT or RVVT.<sup>51</sup> A prolongation of clotting time in these assays is due to the presence of a circulating anticoagulant if the clotting time remains prolonged after mixing patient plasma with normal plasma. This approach may be regarded as a functional measurement of a subset of antiphospholipid antibodies.

A test for antibodies to a specific phospholipid, cardiolipin (one of the antigens used in the VDRL test), involves a very different assay from the one used in the lupus anticoagulant test. This test detects subpopulations of overlapping but not identical antibodies.<sup>54,55</sup> Most laboratories use an ELISA technique to measure anticardiolipin (aCL).

Most authors conceive of antiphospholipid antibodies as representing a spectrum of antibodies including the BFP-STS, the lupus anticoagulant, and

anticardiolipin antibody.<sup>51,56</sup> Controversy persists as to which test provides greater predictive value for clinical complications. Patients with the antiphospholipid antibody syndrome may present with clinical features of arterial and venous thrombotic events (including stroke, pulmonary emboli, and deep venous thrombosis) and fetal loss. Less frequent manifestations are migraine, chorea, livedo reticularis, and endocardial lesions. At the laboratory level, thrombocytopenia may be intermittent, and when present, may be associated with bleeding. Hemolytic anemia and positive Coombs' tests have also been reported. Treatment for the antiphospholipid antibody syndrome has not yet been clearly defined, but therapy with both anticoagulants and immunosuppressives has been attempted.

### Hematologic Autoantibodies

Autoantibodies can be important mediators of the hematologic abnormalities in systemic lupus. Anemia is common in SLE, but in only a small portion of patients is it due to Coombs' positive autoimmune hemolytic anemia.<sup>5,57</sup> Leukopenia ( $< 4000$  per  $\text{mm}^3$ ) occurs frequently in SLE (40 to 80 percent of patients) and involves both the granulocytes and lymphocytes. Leukopenia may be mediated by immune complexes or complement-mediated aggregation. Lymphopenia ( $< 1500$  per  $\text{mm}^3$ ) may be one of the most common manifestations of lupus and is usually mediated by anti-T-cell autoantibodies.<sup>58</sup> Thrombocytopenia is less common than anemia or leukopenia, with approximately one-third of patients having a mild thrombocytopenia (100,000 to 150,000 per  $\text{mm}^3$ ) and one-tenth to one-quarter having platelet counts of less than 100,000 per  $\text{mm}^3$ .<sup>5,57</sup> Autoantibodies may be responsible for the thrombocytopenia seen in some lupus patients, but other mechanisms are also important; methods to evaluate anti-platelet antibodies in the clinical setting are technically difficult.

### Summary

Systemic lupus erythematosus is characterized by an enormous and increasing array of antibodies to cellular constituents. Autoantibodies can be subdivided by their immunologic antigen-binding specificity. Recent studies suggest that there is important clinical relevance to individual subsets and clusters of specific autoantibodies. It must be emphasized that these autoantibody phenomena are not diagnostic in themselves but must be interpreted within the context of the individual clinical situation.

When it comes to building your financial future, you can't afford to settle for second best. That's why more and more of your colleagues are turning to PSA Financial Center for a full spectrum of financial, risk management, and investment counseling services designed expressly for the medical profession.

Our seven affiliate companies, both individually and as a team, have worked closely with over

## WE PUT IT ALL TOGETHER FOR YOU.

1,400 doctors, surgeons and support personnel to provide superior solutions to almost every kind of financial need and objective - regardless of its complexity.

The result is a level of experience, expertise, and proven performance that has made us a leader in all of our fields. Not to mention a powerful reason to give us a call today. At PSA, we put it all together for you. Let us show you exactly how.

# Variants/Subsets of SLE

---

Howard W. Hauptman MD

---

*Dr. Hauptman is Head, Division of Rheumatology, Department of Internal Medicine, Greater Baltimore Medical Center, Baltimore, MD.*

---

*Although systemic lupus erythematosus can be considered a single diagnostic entity, a number of clinical subsets have been described including late-onset lupus, drug-induced lupus, neonatal lupus, discoid lupus, and subacute cutaneous lupus.*

---

**T**he diagnosis of systemic lupus erythematosus (SLE) is based on a compilation of signs and symptoms, as well as a number of confirming laboratory tests. Lupus is commonly believed to be the prototypal autoimmune disorder with a generally poor course and eventual poor outcome. A common misconception is that all cases of SLE are similar. Although SLE can be considered a single diagnostic entity, a number of clinical subsets have been described. By classifying patients into one of these subsets, prognosis and future course of the disease can be assessed more accurately, resulting in a higher quality of care for these patients.

To understand the manner in which SLE is characterized and divided into its various subsets requires an understanding of its historical background. Descriptions of a number of chronic skin conditions from the ancient Greeks through the nineteenth century were eventually classified as lupus. However, in 1872, Moriz Kaposi proposed a new means of classification by dividing lupus into two types.<sup>1</sup> The first was limited to cutaneous manifestations and the second included a more systemic pattern of symptoms. Over the next century, a large amount of research was undertaken to better understand this systemic process. A number of large studies have described its features as those of a chronic multisystem disease with a variable course.<sup>2-5</sup> However, with newer technology in the laboratory and a better understanding of the clinical disease, a number of subsets can be found within this disorder. Although this may be an artificial means of classifying a series of clusters of patients, it has broader implications in our understanding of pathogenesis, clinical spectrum, and prognosis. These subsets include late-onset lupus, drug-induced lupus, neonatal lupus, discoid lupus, and subacute cutaneous lupus.

## Late-onset Lupus

Although SLE is thought of as a disease that predominantly affects women in the second to fifth decades of life, a number of large studies describe a subset presenting at a later age.<sup>5-9</sup> This

group of patients comprises 6 to 20 percent of the cases and is referred to as late-onset lupus.<sup>6,8,9</sup> These studies imply that this group of patients has a different clinical, serologic, and prognostic picture than that seen in younger patients.

Patients presenting after the age of fifty tend to have more subtle symptomatology. In one study, the average duration of symptoms prior to diagnosis was fifty months, while that of patients under twenty years of age was only fourteen months.<sup>6</sup> The presenting complaints, as well as organ involvement, were also less severe in the older patients. Prominent features of SLE observed in young individuals include skin rashes, arthritis, Raynaud's syndrome, and alopecia, as well as renal and nervous system involvement.<sup>6,9,10</sup> Although the data from collected studies of older patients have appeared heterogeneous, the features appear milder.<sup>6,7,9,10</sup> The most common manifestations included serositis, parenchymal lung involvement, and constitutional symptoms such as fatigue and weight loss. Also common, but at a much lower frequency when compared with the SLE population in general, were arthritis, rashes, and adenopathy. Obvious by their exclusion were features associated with more serious organ involvement such as significant kidney and central nervous system disease. A gender difference has been documented in this age group from the expected 9:1 female to male ratio to less than 3:1.<sup>11</sup> The diagnosis may be difficult because these patients may present with symptoms or signs of polymyalgia rheumatica or rheumatoid arthritis.<sup>7</sup> In a 1979 study reported by Baker, the initial diagnostic impression was incorrect in 55 percent of the patients.<sup>9</sup>

Serologic changes have also been observed in late-onset disease. Antinuclear antibodies are commonly found in most patients with SLE regardless of age.<sup>12</sup> However, high titer anti-deoxyribonucleic acid (DNA), anti-Sm antibodies, and hypocomplementemia are uncommon. This correlates with the clinical pattern of milder disease in this older age group.<sup>10,12,13</sup> Antibodies to Ro and La have been found in a strikingly higher frequency in this population, often at least twice that found in the younger age groups.<sup>7,13</sup> Human lymphocyte antigens (HLA) have also been studied in late-onset disease and an increased incidence of HLA-DR3 was observed. In younger patients, there is a higher concordance with HLA-DR2.<sup>8,14</sup> These results raise the possibility that many patients diagnosed with late-onset lupus may instead have another systemic condition such as Sjogren's syndrome.

The prognosis and outcome for patients diagnosed with SLE in later years is much better than that seen in the younger population.<sup>6,9,10</sup> This was supported by the study by Baker et al which showed a five-year survival rate of 92.3 percent and a nine-year survival rate of 83.1 percent.<sup>9</sup> Of the five deaths observed in this study, only one resulted from active SLE. Additionally, the use of corticosteroids should generally be minimized, with the

total dose much lower than in the general lupus population.<sup>6,9,10</sup> This is important in the approach to the elderly population with lupus, since in this population, the drug has added hazards.

### Drug-induced Lupus

Despite the vast number of studies of SLE, no specific etiologic agent has been identified. However, in a small subset of SLE patients, certain chemicals, environmental agents, or drugs have been implicated in the onset of disease symptoms. Clinically, this can vary from abnormal laboratory results, including serologic changes, to the onset of a multisystem disease. Studies have demonstrated two possible interactions between drugs and clinical disease. Occasionally in patients with established SLE, certain drugs, such as sulfonamides and hormone supplements, have been implicated as the cause of an exacerbation of the disease.<sup>15-17</sup> Other drugs, when used over a prolonged period of time, can actually result in lupus-like symptoms. Upon discontinuation of the inciting agent, the patient becomes asymptomatic.<sup>18-21</sup>

The first report of a drug association with SLE appeared in 1945 with the description of a lupus-like illness associated with the antibiotic sulfadiazine.<sup>22</sup> On review, this description departs from drug-induced lupus as we now consider it. In the 1950s, hydralazine was also described as causing lupus-like symptoms, and in the 1960s, procainamide was added to this list.<sup>18,19</sup> With its frequent use in cardiac arrhythmias, procainamide soon became the most commonly associated agent in drug-induced lupus. Over the next decade, isoniazid,<sup>20</sup> a number of anticonvulsants,<sup>21</sup> and psychotropic drugs also were shown to cause lupus-like syndromes.<sup>23</sup> Since that time, several dozen other drugs have been linked to lupus-like illnesses. Doubts exist, however, concerning this latter group's true association with the disease, since most of these reports have been anecdotal and sporadic.<sup>24</sup> As a whole, the commonly implicated drugs are classified into a small number of therapeutic categories: antihypertensives, antiarrhythmics, anticonvulsants, estrogen-containing compounds, and sulfonamide derivatives.<sup>25</sup> Lastly, a number of chemical compounds have been linked with the onset of disease symptomatology. Hydrazines are the most common and are found in a number of drugs as well as environmental substances, including mushrooms, tobacco, and products used in industry, medicine, and agriculture.

Several populations are at risk for developing drug-related lupus. In the pediatric age group, this syndrome is seen with the use of anticonvulsants.<sup>23</sup> In the elderly, antihypertensives and drugs used in the treatment of heart disease are frequently implicated. In contrast to the marked female predominance in idiopathic lupus, the male/female ratio becomes fairly equal in drug-induced lupus. For reasons not well understood, this syndrome is also relatively uncommon in blacks. Data concerning incidence are lacking.

Although the exact presentation and course may vary slightly depending on the drug being used, the clinical manifestations of drug-induced lupus appear to be somewhat milder than those seen in idiopathic disease (Table). Symptoms at onset can be insidious or abrupt. Most of the patients fulfill the revised American Rheumatism Association (ARA) criteria for systemic lupus.<sup>26</sup> Constitutional features including fevers, malaise, and weight loss are very common. Other common manifestations include serositis (pleuritis and pericarditis) and joint involvement. Rarely are the more serious manifestations of idiopathic lupus seen, such as significant central nervous system or renal disease. Skin rashes and actual joint deformities are also often lacking.<sup>27</sup> In fact, if significant multisystem disease is seen in patients receiving one of these drugs, the diagnosis of idiopathic lupus or another disease should be considered. Most patients who develop drug-induced lupus have been receiving the drug for a prolonged period prior to disease manifestations. However, cases have been described as early as one month after initial use of the drug. Usually, resolution of the clinical course follows closely after discontinuation of the inciting drug, although in rare cases symptoms may persist for months.<sup>28</sup>

A prompt diagnosis is essential to insure a good outcome. This requires a high index of suspicion when evaluating patients in the appropriate population. Difficulty in recognition may be a result of the increasing number of new drugs being produced and the lack of data concerning their potential risk for inducing a lupus-like syndrome. The physician must be cognizant of this at all times since early manifestations are often subtle and nonspecific. When the diagnosis is suspected, the inciting drug should be immediately stopped if possible. For symptomatic relief, non-steroidal anti-inflammatory drugs are often helpful; however, there does not appear to be any role for the use of high dose corticosteroids or antimalarials. Within the first weeks, most symptoms will have subsided without any specific drug treatment.

Treating patients with idiopathic lupus may present an occasional dilemma for the physician. Will the use of one of these drugs place the patient at increased risk of exacerbating his or her underlying disease? An example of this is the use of anticonvulsants in a patient with central nervous system involvement. Experience has shown that these patients are not at significant risk of worsening their disease course by initiating these drugs, although close monitoring is imperative to avoid potential complications.

A number of the drugs associated with drug-induced lupus have been shown to cause laboratory abnormalities in patients who have not demonstrated any clinical manifestations of a lupus-like syndrome. After one year, 30 percent of patients taking hydralazine, and 50 to 100 percent of patients taking procainamide, will develop a positive antinuclear antibody (ANA).<sup>29,30</sup> However, the majority of these patients will not show any evidence of active disease. Therefore, an isolated laboratory abnormality in an asymptomatic patient should not cause any modification in the treatment regimen. In patients with clinical drug-induced lupus, however, a number of laboratory abnormalities are often seen. By definition, all patients must have a positive ANA. These antibodies are often directed against nuclear histones and, therefore, will have a homogeneous fluorescent pattern and a positive antihistone antibody. Lupus erythematosus (LE) cells are seen in up to 75 percent of patients. The sedimentation rate is often elevated in the moderate to high range. Other laboratory abnormalities seen include positive rheumatoid factors, leukopenia, Coombs' positivity, and anti-single-stranded (ss)DNA. Lacking in most cases, are low complement levels, anti-double-stranded (ds)DNA, and anti-Sm antibodies, which are characteristic of many patients with idiopathic lupus.

The exact mechanism of drug-induced lupus remains unknown. Several drugs such as procainamide, hydralazine, and isoniazid are metabolized in the liver by acetylation. It is believed that factors that increase the risk of developing lupus include the amount of drug prescribed and the rate of acetylation. It appears that either the drug procainamide or a non-acetylated metabolite is responsible for the induction of the syndrome. Slow acetylators accumulate these drugs and are at higher risk of developing symptoms than fast acetylators.<sup>31</sup> Approximately 50 percent of the population in the United States consists of slow acetylators.<sup>32</sup> The acetylated metabolite, N-acetyl procainamide, rarely causes ANA-positivity or active clinical disease.<sup>33</sup> Patients who develop lupus symptoms while taking procainamide can generally take this metabolite without any further difficulty.

Immunologic mechanisms explaining the drug-induced lupus syndrome remain speculative. However, several mechanisms have been postulated. In the cross-reactivity model, the similarity of the molecular structure between certain drugs and purine bases of DNA

**Table. Drug-induced v Idiopathic Lupus**

Features	Drug-induced Lupus	Idiopathic SLE
<b>Demographic</b>		
Age (yrs.)	older	20-40
Sex (F:M)	equal	9:1
<b>Clinical</b>		
Constitutional	50-74 percent	≥ 75 percent
Articular	≥ 75 percent	≥ 75 percent
Serositis	25-49 percent	50-74 percent
Skin rash	<25 percent	≥ 75 percent
Renal	0	50-74 percent
Central nervous system	0	25-49 percent
<b>Immunologic</b>		
Antinuclear antibody	100%	≥ 75 percent
Anti-nRNP	< 25 percent	< 25 percent
Anti-Sm	0	25-49 percent
Anti-nDNA	0	25-49 percent
Anti-histone	≥ 75 percent	< 25 percent
Complement	Normal	Reduced

can cause the production of antibodies to DNA.<sup>34</sup> Another model is based on the observation that a number of drugs can interact with nuclear antigens by binding to nucleoproteins or DNA. Hydralazine, procainamide, and isoniazid have demonstrated this ability in a number of *in vitro* studies.<sup>35-37</sup> This binding can alter the nucleic acid's determinants, thus converting its usually poor immunogenicity to a stronger immunogenic compound. Another mechanism is based on the effects that many of these drugs have on T-lymphocytes, either directly or indirectly. Procainamide has been shown to effect both T-helper as well as suppressor populations.<sup>38,39</sup> Both hydralazine and procainamide have elicited anti-lymphocyte antibodies impairing lymphocyte function.<sup>40,41</sup> Unfortunately, no single mechanism has been consistently linked to this disorder at the present time.

Some researchers believe that a genetic component may be required to explain some of these mechanisms.<sup>42</sup> HLA-DR4 has been correlated with hydralazine-induced lupus, which differs from the association of HLA-DR2 and DR3 with idiopathic disease.<sup>42</sup> However, present data remain inconclusive.

### Neonatal Lupus

Neonatal lupus was first described in 1954 in an infant born with erythematous macules across the face and scalp which disappeared by three months of age.<sup>43</sup> Since that time, more than 100 cases have been described in the literature. Although this number appears small, the incidence is thought to be underestimated. Besides skin involvement, studies have associated the presence of a congenital heart block and the universal finding of autoantibodies with this syndrome.<sup>44,45</sup> Since immunoglobulin G (IgG) can cross the placental membrane, maternal autoantibodies such as ANA, anti-Ro(SSA), anti-La(SSB), and antibodies that bind to specific hematopoietic cells are found in the newborn of mothers with SLE or with anti-Ro(SSA) antibody positivity.<sup>46</sup> Except for infants with anti-Ro(SSA), there are no clinical manifestations associated with these antibodies and they will disappear in the first few months of life.

The skin manifestations typically begin soon after birth and present as a photosensitive rash which may be scaly, erythematous, and maculopapular and which, in some, may be similar to the subacute cutaneous lupus seen in adults. These changes often begin in the periorbital area and then spread to include any sun-exposed region. The histologic changes are similar to those seen in discoid lupus with follicular plugging, hyperkeratosis, epidermal atrophy, and mononuclear cell infiltration. On immunofluorescence, immunoglobulin and complement complexes may be found at the dermoepidermal junction.<sup>47</sup> Generally, skin manifestations clear by six to twelve months of age. In most cases, no residua is found but occasionally mild scarring, skin atrophy, and depigmentation can be seen.<sup>46</sup> While the

skin lesions remain present, Ro or La antibodies are found, but with fading, these will decrease. The differential diagnosis includes eczema, psoriasis, seborrhea, superficial fungal infections, and erythema multiforme.<sup>48</sup> Management consists of observation, sun avoidance, and the occasional use of topical steroids; however, topical steroids may contribute to skin atrophy and are best avoided.

The first report of congenital complete heart block was in 1901.<sup>49</sup> It was not until 1945 that this was described in an infant of a mother with SLE.<sup>50</sup> However, these were not associated until several reports appeared in the 1970s. It was postulated that a plasma factor transferred across the placenta may be responsible for the changes seen in the infant.<sup>51-53</sup> In 1981, the placental transfer of anti-Ro antibodies was documented,<sup>54</sup> followed by its association with congenital heart block.<sup>55</sup> The Ro(SSA) antigen is a small cytoplasmic ribonucleoprotein distinct from the Sm, RNP, and La(SSB) antigens. The antibodies to Ro are found in approximately 25 to 40 percent of all lupus patients,<sup>56</sup> 1 percent of the general population,<sup>57</sup> and 84 percent of mothers of infants with congenital heart block. Mothers of infants born with congenital complete heart block were often asymptomatic for connective tissue diseases but these antibodies generally were present in both mother and infant. Over time, as expected, one may see the disappearance of the antibodies in the offspring although the heart block is permanent.<sup>46,57</sup> Mothers of infants born with heart block are thought to have a 30 to 60 percent chance of having or developing a connective tissue disease. Additionally, there is a 5 percent mortality in children with congenital heart block without associated maternal SLE compared with a 20 to 30 percent mortality in those with maternal SLE.<sup>58</sup> The condition manifests itself clinically as a sudden onset of bradycardia in utero, followed by congestive heart failure.

The histological changes seen within the infant myocardium in those with congenital heart block include endocardial fibroelastosis, irreversible calcification and degeneration of the atrioventricular conduction system.<sup>51,59</sup> The presence of Ro antigen has been found in fetal myocardium as early as the sixteenth week of gestation. Antibodies to Ro have also been found deposited in the interstitium and endocardium of an infant with congenital heart block.<sup>60</sup>

The third clinical manifestation seen in children with the neonatal lupus syndrome involves hematologic abnormalities. These include Coombs'-positive hemolytic anemia, leukopenia, and thrombocytopenia.<sup>61</sup> These are generally seen at birth or in the first few weeks of life and resolve within two months. It is thought that these result from the passage across the placenta of maternal antibodies to these specific cells. Since clinical manifestations are mild, no treatment is generally necessary. Steroids are occasionally used and have proven to be effective. Blood transfusions are rarely required. Mis-

ellaneous clinical findings associated with neonatal lupus include hepatosplenomegaly, lymphadenopathy, and pneumonitis. These findings are also transient, as seen in all the other manifestations of this disorder.

Issues concerning neonatal lupus syndrome need to be addressed when discussing family planning with lupus patients. There are tests available to screen for this disorder and modalities available to improve survival in infants at risk. The risk for a mother with SLE of having a baby with congenital heart block is approximately one in sixty pregnancies, but the risk increases to one in twenty in the presence of anti-Ro(SSA) antibodies.<sup>62</sup> Other causes of fetal loss such as spontaneous abortions are not seen.<sup>62</sup> All mothers with SLE should be screened for anti-Ro(SSA) antibodies to determine the potential risk for neonatal lupus syndrome. If the titer for this antibody is significantly elevated, abdominal ultrasound, fetal nonstress tests, and fetal echocardiography should be performed. Even in the presence of the anti-Ro antibody, the risk of developing manifestations of this syndrome remains small. Therefore, the clinical approach in this situation should be close monitoring to determine the need for a premature delivery. After delivery, a pediatric cardiologist should assess the infant to determine the need for a pacemaker. Cardiac monitoring for congestive heart failure should be maintained. Thereafter, cardiac status should be followed for the first few months to observe for late complications. The actual risk of developing manifestations of adult SLE, although never calculated, appears to be small.

### Cutaneous Subsets of Lupus

Although there are many manifestations of SLE that are characterized by skin involvement, only two major cutaneous subsets are found which are often distinguished from the systemic form of the disease. Descriptions of the discoid variant preceded the first descriptions of systemic disease by several centuries. It was only in the 1970s, however, that subacute cutaneous lupus erythematosus (SCLE) was appreciated.

Discoid lupus erythematosus (DLE) is thought to be on the benign end of the broad spectrum of disease known as systemic lupus erythematosus.<sup>63</sup> Manifestations are generally limited to the skin and lack associated systemic symptomatology. Onset can occur at any age but most commonly presents between the ages of twenty and forty years. Although the lesions can be disseminated, the majority of patients have lesions limited to the head, neck, and scalp. Progression of the rash by sun exposure can be seen in up to 50 percent of DLE patients.<sup>64</sup> Of the few patients who go on to develop significant laboratory abnormalities or develop manifestations of systemic disease, the majority will have diffuse skin involvement.<sup>65</sup> Mucous membrane involvement is also seen, usually coexisting with the skin disease.

Clinically, the skin lesions of DLE are characteristic.<sup>63</sup> They begin as erythematous patches and can become scaly and plaque-like in appearance. The lesions will often enlarge and may coalesce. Over time, other changes can occur including the development of telangiectasias, central atrophy with hypopigmentation, and hyperpigmentation at the active borders. Follicular openings may become dilated and will often become plugged with epithelial debris. Some of the patches resolve but most of the lesions heal with residual scarring and areas of atrophy. A patchy irreversible alopecia occurs when the scalp is actively involved due to follicular destruction.

Several histologic changes are commonly seen in the lesions of DLE.<sup>65</sup> On the skin surface, there is hyperkeratosis and follicular plugging. Within the basal layer of the epidermis, there is disorganization of basal cells, edema, and mononuclear cell infiltration along the dermal-epidermal junction. Immunoglobulin and complement components have also been found along this junction and it is thought to be the principal site of injury. In the dermal area, a mononuclear cell infiltrate is commonly seen, but its depth and distribution may vary.

Patients with discoid skin lesions alone rarely have significant laboratory abnormalities.<sup>66</sup> Antinuclear antibodies can be detected in up to 30 percent of these patients but in only 5 percent are titers significantly elevated. Rarely are other immunological abnormalities recognized, such as false positive tests for syphilis, leukopenia, low complement levels, increased globulins, and the presence of rheumatoid factors. If other laboratory abnormalities are observed in a patient with DLE, one should be aware of the possible risk for developing systemic disease. The actual risk of DLE progressing to SLE in patients who are asymptomatic for systemic disease is in the 5 to 10 percent range.<sup>67</sup> In this situation, the systemic disease manifestations are relatively mild. When patients presenting with systemic disease were examined, approximately 10 to 15 percent exhibited features of discoid lesions.<sup>68</sup>

Treatment of patients with DLE is based on the assumption that any evidence of systemic signs or symptoms has been aggressively pursued to exclude the diagnosis of SLE.<sup>63</sup> These patients should have a thorough initial examination with extensive laboratory testing. Although many patients may not demonstrate obvious photosensitivity, measures should still be taken to avoid sunlight when possible. The use of wide-brimmed hats and long sleeves, and the use of one of the more potent sunscreens are recommended. The discoid lesions can be treated with topical steroid creams or steroid preparations can be injected directly into the lesions. If these prove ineffective or the distribution of lesions are too widespread, short courses of oral steroids can be administered. In many such instances, especially if photosensitivity is observed, antimalarials may be effective.<sup>63</sup> One should be aware that these drugs will often require four to eight weeks of

therapy before a clear-cut clinical benefit is observed. The greatest potential toxicity is retinal damage. However, the risk of this is extremely low when using the recommended dosages and when these patients are closely monitored with regular ophthalmologic examinations (Figures 1 and 2).

The second cutaneous subset of SLE is subacute cutaneous lupus erythematosus (SCLE). The clinical features of this disorder differ from those of discoid

**Figure 1.** Scarring, alopecia, and atrophy in a patient with discoid lesions. (From the Slide Atlas of Rheumatology, Gower Medical Publishing, Ltd., New York.)

**Figure 2.** Nonscarring annular plaques seen in SCLE. (From the collection of Lisa Beck MD, Chief of Dermatology, Francis Scott Key Medical Center, Baltimore, MD.)

lupus in a number of ways. This difference was first recognized in a group of patients who had a distinctive nonscarring skin lesion associated with marked photosensitivity.<sup>69</sup> The primary lesion may begin as a small erythematous plaque or papule which will often expand and eventually merge with other lesions. These lesions are annular, papulosquamous, or psoriasiform in appearance and often become widespread, especially in sun-exposed regions. Photosensitivity plays a more important role in SCLE than in DLE. With resolution, the classic changes of scarring and atrophy seen in DLE are not found.

Often mild systemic disease manifestations are observed in SCLE.<sup>70</sup> The most commonly seen symptoms include arthralgias or arthritis, myalgias, fevers, and malaise. Significant renal and central nervous system involvement are unusual. Serologically, most patients have circulating antibodies to the Ro(SSA) antigen and, less commonly, to La(SSB).<sup>69</sup> Approximately 63 percent of SCLE patients will have a positive ANA test. This compares with 4 percent of asymptomatic DLE patients, and 90 percent of SLE patients. Other laboratory abnormalities seen in this subset of patients include leukopenia (19 percent), low complement studies (22 percent), and anti-DNA antibodies (37 percent).

Histologically, the skin lesions have many of the changes seen in other forms of cutaneous lupus. There is less follicular plugging and hyperkeratosis than seen in DLE lesions. Immune deposits at the dermoepidermal junction of involved lesions are seen in less than 50 percent of biopsies, compared with approximately 90 percent of DLE lesions.<sup>71</sup>

Management of SCLE is very similar to that of DLE. Because of the marked photosensitivity, aggressive avoidance of the sun is most important. The same therapeutic modalities used in DLE are employed in SCLE, including topical and systemic steroids, as well as anti-malarials. These regimens are less effective, however. If systemic manifestations become prominent, treatment regimens should be modified accordingly.<sup>72</sup>

## Conclusion

Systemic lupus erythematosus is commonly recognized as a single homogeneous disorder. However, better understanding of its subsets allows for improved management of these patients. The recognition of late-onset and drug-induced lupus requires a high index of suspicion since features may be subtle and nonspecific. Early diagnosis will allow prompt therapeutic intervention. Delays, however, may markedly alter the patient's quality of life. Recognition of the individual subsets of cutaneous disease and their differentiation from SLE should influence the physician's approach to these patients. Since the disease is milder and more limited, treatment regimens can be modified accordingly. Educating patients of this fact allows for less anxiety on their part and, subsequently, a better lifestyle.

# Management of the Pregnant Lupus Patient

---

John T. Repke MD and Michelle Petri MD, MPH

---

*Dr. Repke is Associate Professor, Department of Gynecology and Obstetrics, The Johns Hopkins University School of Medicine, and Co-Director of the Lupus Pregnancy Center, The Johns Hopkins Hospital. Dr. Petri is Assistant Professor, Division of Molecular & Clinical Rheumatology, Department of Medicine, The Johns Hopkins University School of Medicine, Co-Director of the Lupus Pregnancy Center, The Johns Hopkins Hospital, and recipient of the Clinical Associate Physician award, OCRC # RR00722.*

---

*Increased understanding of SLE as it relates to pregnancy has allowed for many women with lupus today to have a successful pregnancy. However, pregnancies are high risk with up to 25 percent ending in miscarriage and with a high frequency of preterm delivery.*

---

Pregnancy complicated by any medical illness can present a challenge to both internists and obstetricians. The challenge of lupus pregnancy is particularly striking because of the number of issues that must be confronted. While many of the rheumatologic issues are of extreme importance during pregnancy, the obstetrician has an additional perspective on lupus, namely, how it affects the relationship between mother and fetus.

## Preconception Counseling

Fortunately, an increasingly common scenario is the patient with systemic lupus erythematosus (SLE) contacting an obstetrician to discuss planning a future pregnancy. This represents the optimal situation for obstetrician, rheumatologist, and patient. Pregnancy outcome frequently will depend on many factors related to the patient's underlying illness. Therefore, counseling prior to conception may allow for a realistic portrait of successful pregnancy outcome chances to be painted for the patient and her husband. This preconception counseling will cover several areas. The most frequently asked questions of obstetricians by patients relate to the effect of the disease on the pregnancy, the effect of the pregnancy on the disease, and the effect of the disease and/or medications on the fetus.

## The Effect of SLE on Pregnancy

To determine the effect of SLE on pregnancy, we must first review certain aspects of SLE. Among factors affecting pregnancy outcome in patients with SLE will be the presence or absence of hypertension, the presence or absence of renal disease, prior

reproductive history, and disease activity or quiescence.<sup>1</sup> Another factor recently cited as being of prognostic importance is the presence of antiphospholipid antibodies.<sup>2</sup> The patient with the best prognosis is the patient who has had quiescent disease for six or more months prior to conception, no evidence of renal involvement, no evidence of hypertension, no evidence of anticardiolipin or lupus anticoagulant antibodies, and who has either had a previously good reproductive history or whose current pregnancy represents her first one. On the other hand, the poorest prognostic candidate would be the patient with hypertension, renal disease, active disease at the time of conception, and a history of either recurrent pregnancy loss in the first trimester or previous stillbirth thought to be secondary to disease activity or antiphospholipid antibodies.

### Effect of Pregnancy on SLE

Whether or not pregnancy adversely affects the course of SLE remains a point of continuing controversy, with literature supporting both sides of the argument.<sup>3,6</sup> Recent evidence from our own institution however, suggests that pregnant patients with lupus may be at higher risk for flare of their disease than was previously thought. In general, it is believed that careful attention to controlling disease activity in the pregnant patient with lupus is essential.

### Clinical and Serologic Evaluation

The initial clinical evaluation of the patient with lupus is described elsewhere in this journal. Generally, there is little additional clinical evaluation to be done by the obstetrician once a complete rheumatologic evaluation has been accomplished. Serologic evaluation consists of a battery of tests (Table 1) that will assist in establishing a baseline for the individual patient so that management as the pregnancy progresses can be guided, in part, by serologic changes. Serial measurement of C<sub>3</sub> and C<sub>4</sub> may be especially important during pregnancy. C<sub>3</sub> and C<sub>4</sub> normally rise during pregnancy;

falling values may help differentiate a lupus flare from preeclampsia.<sup>7</sup>

Also, certain serologic measurements may allow for identification of particular patients who are at risk for adverse perinatal events. The three most frequently looked at substances in this regard are the lupus anticoagulant, anticardiolipin antibody, and antibodies directed against the Ro (SSA) and La (SSB) antigens.

### Lupus Anticoagulant and Anticardiolipin

The presence of lupus anticoagulant, anticardiolipin, or both, has been implicated in habitual pregnancy loss in the first trimester as well as in unexplained mid-trimester loss.<sup>8,9</sup> Controversy exists as to what the optimal treatment should be when these antibodies are found. In large part, obstetricians are guided by prior reproductive history to determine whether or not treatment needs to be initiated. When it is determined that treatment should be initiated, regimens consisting of aspirin, prednisone, heparin, or some combination thereof, have been employed. In our clinic, the most frequently employed regimen consists of low-dose aspirin (80 mg/day) combined with prednisone. The theory behind low doses of aspirin is that it allows for minimal inhibition of endothelial cell production of prostacyclin while inhibiting platelet thromboxane production, thereby minimizing the risk of thrombotic events. This may be significant not only for clinical thrombophlebitis for which these patients are at risk, but for decidual thrombus formation that may be part of the etiology of unexplained pregnancy loss. Prednisone may also be added to this regimen since it may suppress production of anticardiolipin antibody and production or, at least, activity of the lupus anticoagulant. In our institution, the association of antiphospholipid antibodies, either anticardiolipin or lupus anticoagulant, with pregnancy loss, has not been as strong as in other reports. However, our four patients who have had second-trimester losses have all had antiphospholipid antibodies.<sup>10</sup>

### Anti-Ro Antibody

Identification of patients positive for anti-Ro or anti-La is important, for it is these patients who may be at increased risk of having a child with congenital complete heart block or neonatal cutaneous lupus.<sup>11</sup> While the majority of individuals positive for these antibodies will not have infants with congenital complete heart block, the majority of infants with congenital complete heart block are born to mothers with either anti-Ro or anti-La antibody. Patients thus identified should be monitored closely with careful auscultation of the fetal heart tones for at least a full minute at each prenatal visit. Fetal echocardiography to review for structural abnormalities or any evidence of atrioventricular dissociation may be added to the regimen at the discretion of the clinician.

**Table 1. Initial Laboratory Evaluation of Lupus Pregnancy**

ANA screen and titer	
Anti-dsDNA	
Precipitin antibodies (anti-Ro, anti-La)	
Lupus anticoagulant	
Anticardiolipin	
C <sub>3</sub> , C <sub>4</sub>	
CH <sub>50</sub> (total serum hemolytic complement)	
Chemistry panel and electrolytes	
Complete blood count	
Thyroid stimulating hormone	} If clinically indicated
Free thyroxine	
Anti-platelet antibodies (direct and indirect, if evidence of thrombocytopenia)	
Activated partial thromboplastin time (APTT)	
24-hour urine for total protein, creatinine and calcium excretion	

## Management of the Pregnant Patient

Once the patient with SLE has successfully achieved a pregnancy, careful coordinated management by obstetrician and rheumatologist is essential to optimize the likelihood of a successful outcome. First trimester management from the obstetric standpoint is quite routine. The patient is carefully assessed for any evidence of discrepancy between size and dates, and fetal heart tones should be auscultated at the earliest possible time, usually by nine to ten weeks with Doppler and as early as five weeks with vaginal ultrasound. Serologic evaluation is also done looking for any evidence of disease activity as might be reflected by lowered complement levels, increased proteinuria, or other physical signs or symptoms suggestive of disease flare. Patients frequently will ask about teratogenic effects of medications during pregnancy and usually may be reassured in that the most commonly employed drug, prednisone, has not been demonstrated to be a human teratogen. Utilization of other drugs such as aspirin, dipyridamole, chloroquine, and azathioprine have been successfully used but must be limited to those circumstances in which the benefit of using the drug clearly outweighs the risks. Patients should be seen on a routine basis in the first trimester with documentation of fetal viability at each visit, since these patients are at increased risk for first trimester loss.

In the second trimester of pregnancy, evaluations of mother and fetus should continue. In addition to routinely performed obstetrical tests, it is in the second trimester, usually at approximately twenty-two weeks of gestation, that fetal echocardiography is employed in order to look at structural integrity of the heart. While anatomic abnormalities have not been reported to be increased among patients with SLE, in patients who are anti-Ro or anti-La positive, fetal echocardiography may allow for visualization of atrial and ventricular rates and allow for early identification of rhythm disturbances. Additionally, patients with SLE may be at increased risk for mid-trimester pregnancy loss and should be monitored closely for any evidence of lagging fundal growth.

The third trimester of pregnancy represents a particular challenge because it is at this point that fetal viability has been achieved. In our experience, patients who reach the third trimester have generally done well, although patients with lupus do have an increased incidence of low birthweight and preterm delivery. For reasons that are not entirely clear, patients with SLE are also at increased risk for development of the clinical condition known as preeclampsia. Preeclampsia is a disease characterized by hypertension with proteinuria, edema, or both, which usually occurs in the third trimester but which may occur anytime after the twentieth week of gestation. One of the disconcerting features of preeclampsia is that its clinical presentation nearly exactly mimics the clinical presentation of an exacerbation of lupus. Patients with preeclampsia may

present with hypertension, increasing proteinuria, edema, and thrombocytopenia with elevation of liver enzymes and, occasionally, hemolysis. In some instances, it may be impossible to determine whether or not a patient is experiencing a severe exacerbation of lupus or is presenting with severe preeclampsia. Depending on the gestational age of the fetus, it may be necessary to effect delivery; and, if the clinical symptoms resolve, the diagnosis of preeclampsia is virtually assured. However, delivery may not always be feasible, especially at extremely immature gestational ages (less than twenty-eight weeks). Under these circumstances, if the maternal condition allows for expectant management, a trial of medical therapy may be warranted. If a clinical response occurs, an exacerbation of lupus rather than preeclampsia is suggested. A recent test, that may be of some use in helping to distinguish exacerbations of underlying medical diseases from preeclampsia, has employed the measurement of urinary calcium excretion.<sup>12</sup> Preeclamptic patients seem to have characteristically low excretion of urinary calcium as opposed to patients with underlying renal disease or other medical disorders that may manifest as renal dysfunction with hypertension.

Additional testing in the third trimester consists of intensive fetal surveillance. We choose to employ biophysical profile scoring combined with Doppler velocimetry. The biophysical profile is a test that employs nonstress testing with measurement of amniotic fluid volume, fetal breathing movement, assessment of fetal gross body movement, and fetal tone. A biophysical profile score of 10 (Table 2)<sup>13</sup> is strongly suggestive of fetal well-being. Doppler velocimetry is also a useful tool. This technique employs continuous wave Doppler instrumentation with measurement of umbilical artery flow. A ratio of systolic to diastolic flow in the umbilical artery is obtained. Normal values are gestational age-specific, but abnormal values suggestive of increased placental vascular resistance have been associated with intrauterine growth retardation, preeclampsia, and other systemic diseases that may involve abnormal placentation. These tests should be employed on a weekly basis, although their frequency may be increased depending on the clinical situation. In patients who are obese or who otherwise are difficult to examine, monthly ultrasonography for fetal morphometry and weight estimation may be a useful adjunct to clinical assessment of intrauterine growth.

## Intrapartum Considerations

When the patient has entered spontaneous labor or when a clinical situation arises dictating the need for delivery, a combined approach to the delivery process involving obstetrics, anesthesiology, rheumatology, and neonatology will once again contribute to optimizing the chances of a successful outcome.

## Obstetric Considerations

While these high-risk pregnancies may carry with them an increased risk of delivery by cesarean section, by and large, obstetric management may remain routine. Continuous electronic fetal monitoring is recommended for all pregnancies complicated by SLE. There is no contraindication to regional anesthesia, although for patients who have been on chronic low-dose aspirin, a bleeding time may be requested by anesthesiology before placement. There are no large studies suggesting that low-dose aspirin adversely affects bleeding time. Route of delivery is generally indicated by obstetric indications. On occasion, a pregnant patient with lupus may exhibit thrombocytopenia with anti-platelet antibodies. In general, these patients may be managed according to the protocols governing management of patients with immune thrombocytopenia. That is, if they have no bleeding history, if their thrombocytopenia was first noted in this pregnancy, and especially if they do not carry indirect circulating anti-platelet antibodies, then fetal platelet assessment prior to labor may not be necessary. If there is any doubt as to what the fetal platelet count or function might be, then consideration may be given to umbilical blood sampling, fetal scalp blood sampling, or delivery by cesarean section in an effort to minimize the risk of trauma and potentially devastating intracranial hemorrhage in the fetus.<sup>14</sup>

## Anesthetic Considerations

In general, the pregnant patient with lupus may receive anesthesia and analgesia without restriction. Specific information regarding medication usage or other disorders such as restrictive pleuritis or pericarditis should be evaluated by the anesthesiology team, preferably well in advance of the patient's presentation for labor and delivery.

**Table 2. Biophysical Profile Scoring**

Parameter	Normal (= 2)	Abnormal (= 0)
Non-stress test	Reactive	Non-reactive
Amniotic fluid volume	Minimum 2 cm x 2 cm pocket of fluid	Less than 2 x 2
Fetal movement (body)	3 separate movements in 30 minutes	Less than 3 movements
Fetal movement (breathing)	At least one 30 second fetal breathing episode in 30 minutes	Less than one 30 second episode in 30 minutes
Fetal tone	Minimum of one episode of active flexion/extension during study	Less than one episode, or absent movement

Adapted from Manning FA. Dynamic ultrasound-based fetal assessment: The fetal biophysical score. In: Fleischer AC, Romero R, Manning FA, Jeanty P, James AE, eds. Norwalk, CT: Appleton and Lang 1991; 417-28.

## Rheumatologic Considerations

In this setting, the rheumatologist generally remains available as a consultant for cases of disease exacerbation in the postpartum period. As many patients will have been receiving continuous steroids during pregnancy, stress doses are administered during labor. Hydrocortisone 100 mg intravenously every eight hours is usually sufficient to cover patients during the intrapartum period.

## Neonatology Considerations

A neonatologist should be informed of all deliveries of mothers with lupus. While presence at the delivery may not be absolutely necessary, notification of such a delivery with detailed information on the antepartum course is essential if proper evaluation in the newborn nursery is to occur. Newborns of mothers with lupus may themselves have thrombocytopenia and may be at risk for the development of neonatal lupus. Neonatal lupus remains a relatively rare disease with the two most common presentations being that of cutaneous lupus or congenital complete heart block. Pediatric awareness of the clinical situation is generally all that is necessary. Neonates usually do well and their performance is usually gestational age dependent. Neonatal adrenal suppression secondary to maternal corticosteroid use is an extremely rare event. Additionally, breast feeding is not contraindicated in mothers who are taking prednisone for control of lupus symptoms, although this should be discussed with the newborn's pediatrician prior to implementation.

## Postpartum

After delivery, a small number of lupus patients may experience disease exacerbations.<sup>15</sup> For this reason, we generally recommend gradual tapering of medications back to prepregnancy levels or to discontinuation when feasible. Routine postpartum activities are generally allowed. The contraceptive options for patients with lupus need to be discussed at this time. Oral contraceptive use in patients with lupus remains somewhat controversial because of past studies showing exacerbation of disease.<sup>16</sup> Therefore, barrier methods of contraception are preferred. In patients in whom this is unacceptable, oral contraceptives with the lowest effective estrogen dose should be prescribed. Patients with evidence of antiphospholipid antibodies are counseled to avoid oral contraceptives because of a potential increased risk of thromboembolic disease. The new contraceptive, Norplant, may be useful in these individuals but there are no data on its safety or efficacy in lupus patients.

## Conclusion

Much progress has been made in the management

of SLE. The fruits of these successes have allowed for many women who, a decade ago, might have been told to never have children, to begin contemplation of having a family of their own. It is clearly a decision that is not to be taken lightly. However, with patient compliance, preconception counseling, and a comprehensive approach by internist, rheumatologist, obstetrician, and perinatologist, successful outcomes are being increasingly reported.

# Commitment and Service Since 1975

The *Med Chi Agency* was established by the Medical and Chirurgical Faculty in 1975 and now has over 5,000 physicians and employees as clients.

As a comprehensive insurance agency, we are able to offer a wide range of insurance and financial products. You will benefit from the many coverages available for both your professional and personal needs. You will also benefit indirectly, because Med Chi owns the *Med Chi Agency* and the earnings from its operations.

For complete information about any insurance product or service, just give us a call. We can provide the answers you seek and the solutions you need.

# Medical Therapy for SLE

---

David B. Hellmann MD

---

*Dr. Hellmann is Associate Professor of Medicine, The Johns Hopkins University School of Medicine, Baltimore, MD.*

*"Have a chronic disease and take care of it."  
Oliver Wendell Holmes' formula for longevity.*

---

*Today, the major therapeutic challenge in systemic lupus erythematosus is to preserve the gains provided by corticosteroids while reducing their side effects.*

---

**T**he generally favorable course of patients with systemic lupus erythematosus (SLE) today demonstrates powerfully the wisdom of Justice Holmes' words.<sup>1-4</sup> Lupus, however, was not always considered a chronic disease. In the 1950s, half of all patients died within four years from intractable, autoimmune-induced multisystem organ failure.<sup>5</sup> Now, fortunately, early death is a striking exception.<sup>1</sup> Most recent series show a 75 to 90 percent ten-year survival, with much longer survival expected for the majority. These dramatic improvements in survival emphasize physicians' increasing ability to take care of this chronic disease. This article describes the treatments, and their application, efficacy, and limits.

## Non-pharmacologic Therapies

Most people who are well and fortunate enough to take their health for granted, live with the illusion that they have control over their lives. Chronic diseases destroy that illusion. The impact of this on the patient is always forceful, sometimes overwhelming, and many times more distressing than any physical effect of SLE. Younger patients worry about physical attractiveness and providing for children; older patients worry about threats to their independence. All are uncomfortably aware of their own mortality.

The effectiveness of the physician and the satisfaction of the patient are as much dependent on the physician's skill in handling these and other emotional consequences of the disease as on the skill of the pharmacologic manipulations. As soon as the diagnosis of SLE is established, the emotional needs of the patient can begin to be addressed by considering the following.

*Patient Education.* One important way patients regain some sense of control is through education -- to know something is, in part, to control it. Asking the patient what s(he) knows about SLE is a good place to begin judging the patient's exact educational

needs. While educational backgrounds vary, all patients and families benefit from a comprehensible explanation of lupus as an autoimmune disease. One helpful analogy is to describe the immune system as the body's police department which is designed to protect against disease-causing microorganisms; an autoimmune disease such as lupus can, therefore, be considered an example of biologic police brutality in which the immune system attacks the normal denizens of the body (e.g., the kidney, skin, lungs).

The concept of empiric and chronic therapy should also be explained. Most new patients think of therapy as a short course of antibiotics which is universally effective. Long-term therapy with slower acting agents is a foreign notion which should be introduced, explained, and discussed.

The prognosis of patients with SLE should also be sketched in broad strokes. Most patients have an overly pessimistic view and are relieved to learn how very well patients, on average, do. Similarly, patients can gain hope from learning that the severity of lupus varies greatly from individual to individual, with many having only very mild disease. Issues related to pregnancy and disability may also warrant early discussion.

Clearly, not all questions can be discussed in depth at one sitting; education for the patient must be a life-long process. The physician as teacher can be assisted by many others including nurses, physical therapists, occupational therapists, social workers, and other patients who participate in self-help groups. The Lupus Foundation of Maryland and the Arthritis Foundation of Maryland also have many excellent publications and sponsor helpful informational meetings.

**Family Education.** However abstruse and threatening lupus is to the patient, it is equally so to family and to friends. A better understanding of the nature of SLE and its vicissitudes will relieve family anxieties and improve the family's ability to offer emotional support. A spouse and, whenever appropriate, other family members or friends, should accompany the patient for an appointment devoted largely to the discussion of lupus and its impact on the patient. The doctor can then describe two features of lupus that baffle patients and family -- the day-to-day variation and the sometimes incapacitating fatigue which can accompany lupus. That one can have active lupus, feel miserable, and yet appear perfectly well is a puzzling reality that needs description and explanation. Thus, the effective clinician must broaden the educational process to include the patient and the people who support him or her.

**Diet/Exercise.** There is no evidence that diet or exercise has any effect on the activity of SLE. Studies in laboratory animals have suggested that dietary modifications can influence inflammatory outcomes, but no such data exist for humans.<sup>6</sup> Still, diet and exercise should not be dismissed, as they may very well be useful tools to limit the toxicity of prednisone (if needed) and may also be psychologically beneficial.

## General Principles of Pharmacologic Therapy

**Overview.** In a sense, treating SLE is like fire-fighting; the physician must constantly be alert and vigilantly search for the smoke and heat (i.e., organ damage) that indicate that the fire (inflammation) has rekindled. Once spotted, the severity and extent of the fire (inflammatory damage) must be assessed accurately to determine the appropriate response. Small fires (e.g., minor arthritis or minor skin rashes) can be fought with garden hoses (e.g., nonsteroidal anti-inflammatory drugs or corticosteroid creams), larger fires (e.g., pericarditis) may require a fire hose (e.g., moderate dose prednisone), and a conflagration (e.g., diffuse vasculitis) requires a four-alarm response (e.g., high-dose prednisone and possibly an immunosuppressive drug).

The principle that the intensity of treatment must fit the intensity of the disease activity derives from several crucial observations confirmed by multiple studies. These studies demonstrate that for treatment to improve on the now excellent prognosis, the toxicity of therapy must be reduced.<sup>7-10</sup> There is abundant evidence that the major limitations which long-term survivors of SLE face are avascular necrosis of bone and accelerated coronary artery disease -- both largely complications of chronic corticosteroid therapy.<sup>8-10</sup> Another major limitation that can occur early or late is the risk of fatal infection.<sup>9</sup> Indeed, infection has become the number one cause of death in SLE. While patients with SLE have multiple risk factors for infection, high-dose prednisone therapy appears to be the most important. Thus, while the ability of the currently available hoses to put out the fire of SLE is impressive, future gains require limiting the effects of the water damage. The principle that the right size hose must be used for the right size fire is the most important guideline for the pharmacologic therapy of SLE (Table 1).

**Prednisone.** Corticosteroid therapy is the cornerstone of the pharmacologic treatment of SLE.<sup>1,11-21</sup> Of the many preparations of corticosteroids, prednisone is the most common oral formulation used.

Prednisone is a pre-drug that is inactive until it is hydroxylated in the liver to prednisolone.<sup>11,12</sup> Consequently, in patients with severe hepatic disease, prednisolone rather than prednisone should be used.<sup>22-24</sup> In the absence of liver disease, prednisone and pred-

**Table 1. Intensity of Therapy Matches Intensity of Disease Activity**

Disease Manifestations	Possible Therapies
Skin rash	Sun screens, topical corticosteroids, hydroxychloroquine
Arthritis, mild pleuritis	Nonsteroidal anti-inflammatory drugs, hydroxychloroquine
Moderately severe arthritis, fever, pericarditis, polymyositis	Low-medium dose prednisone (10-40 mg/d)
Abdominal vasculitis, severe hemolytic anemia, thrombocytopenia, nephritis	High dose prednisone (40-80 mg/d) and/or immunosuppressive therapy

nisolone are equipotent. Patients ill enough to be hospitalized are often given corticosteroids intravenously as methylprednisolone, which is 20 percent more potent than prednisone (i.e., 50 mg of prednisone equals 40 mg of methylprednisolone).

The dose schedule, like the route of administration, depends on the severity and intensity of the SLE; 20 mg of prednisone given every eight hours is more effective than 60 mg given as a single daily dose. It is also more toxic. But with acute and severe inflammation, where rapid control is the major concern, divided dosing for one to two weeks is preferred. Thereafter, the dose can be consolidated over approximately two weeks to a single daily dose.

Administration of large doses of corticosteroids has become popular in the treatment of rheumatic diseases including SLE.<sup>18,19,21</sup> The enthusiasm stems from the positive results reported with intravenous pulse therapy (i.e., 1,000 mg methylprednisolone given daily for three days) for idiopathic crescentic glomerulonephritis.<sup>20</sup> Attempts to limit toxicity have prompted the use of mini-pulse therapy (i.e., 100 mg of methylprednisolone per day for three days).<sup>25</sup> Thus, in settings requiring high-dose corticosteroids, possible treatments include either oral prednisone 40-80 mg/d or some version of the intravenous pulse therapy. The absence of convincing comparative studies explains the variation in treatment seen in clinical practice.

The toxicity of corticosteroids (Table 2) is a function of the dose and duration.<sup>7,8,11-16,26,27</sup> For some patients, the side effects are worse than the disease. Indeed, the infectious complications of corticosteroids can be fatal. It cannot be emphasized too strongly that the dose and duration of therapy must be justified by the severity of the inflammation.

**Dose Reduction.** The timing of the reduction also depends on the severity of the disease and the response to treatment. Ideally, the original abnormality should be reversed before dosage reduction is begun, but no absolutely firm rule can be given. Because patients with SLE are exquisitely sensitive to dose changes, tapering should usually be slow, with weekly reductions not exceeding 10 to 20 percent of the current dose. The decre-

ments may need to be greater for patients on very high dose therapy. Once the patient gets down to a very low dose (approximately 5 mg/d), the decrement should be in the range of 1 mg per month to allow the patient to adjust to resumption of adrenal function.

**Second-line Agents.** Many different immunosuppressive drugs have been used in SLE (Table 3).<sup>28-40</sup> Their use springs from the hope of finding an agent more effective than high-dose prednisone yet less toxic. Only in lupus nephritis, however, has the efficacy and toxicity been rigorously studied.<sup>35</sup> In all other settings, the indication for a second-line agent is not clear. In clinical practice, second-line agents are considered only when prednisone is ineffective or excessively toxic.

**Monitoring Disease Activity.** Given the autoimmune nature of SLE, it was hoped that serologic tests would faithfully reflect disease activity and help determine the timing and duration of therapy.<sup>36</sup> Unfortunately, serologic tests have many limitations.<sup>40</sup> First, antinuclear antibodies, with the exception of anti-native deoxyribonucleic acid (DNA), do not correlate well with disease activity. Even with the anti-native DNA, the correlation with disease activity is not very strong.<sup>40</sup> A rapid doubling of the anti-native DNA antibody is a better indicator of a flare of disease activity than the actual antibody level itself.<sup>41</sup> Complement tests do not perform much better.<sup>40</sup> It is perhaps not surprising that complement tests, which reflect the average of production and consumption throughout the entire body, may not sensitively measure autoimmune disease occurring in one or several organs. Studies have shown that whether complement is low depends greatly on the sites of inflammation.<sup>40</sup> When renal and extra-renal disease are present, complement is almost always low, whereas extra-renal disease alone produces hypocomplementemia in only a minority of patients.<sup>40</sup> Thus, a patient can have raging central nervous system SLE and normal serum complements. With most patients, it becomes evident during the first two years whether complement tests correlate with disease activity. In such patients, the complement levels do indeed help monitor the course. For most patients, however, therapeutic decisions remain based on clinical evidence of active organ damage.

**Is It Active SLE?** It is critically important to recognize that other disease processes can mimic or be superimposed upon active SLE. The most important poseur of active disease is infection.<sup>9</sup> It is crucial to begin any therapeutic consideration with the question: could an infection be the cause of this putative lupus flare?

**Table 2. Possible Side Effects of Corticosteroid Therapy**

General	Increased appetite, weight gain, cataracts
Cutaneous	Striae, moon facies, buffalo hump, acne, easy bruisability
Endocrine	Diabetes
Gastrointestinal	Gastric ulcer, hemorrhage, perforation, pancreatitis
Bone	Osteoporosis, avascular necrosis of bone
Immunologic	Opportunistic infections
Cardiovascular	Salt retention, edema, hypertension, accelerated coronary artery disease
Neurological	Emotional lability, psychosis, insomnia, decreased memory, proximal muscle weakness

**Table 3. Second-line Treatments of SLE**

Cyclophosphamide
Azathioprine
Chlorambucil
Methotrexate
Plasmapheresis
Total lymph node irradiation
Cyclosporine - A

Failure to distinguish *Pneumocystis pneumonia* from lupus pneumonitis or cryptococcal meningitis from lupus cerebritis will have disastrous consequences.<sup>9</sup>

It cannot be overemphasized that infection is now the number one cause of death; active disease is number two.<sup>9,10,42-44</sup> Most fatal infections are caused by opportunistic infections and the major risk factors are high-dose prednisone and the use of immunosuppressive drugs.<sup>9</sup> While SLE itself -- through renal failure, hypocomplementemia, hyposplenism, and other immunologic defects -- can be a risk factor, major infections are infrequent in the absence of high-dose corticosteroid or immunosuppressive therapy.<sup>9</sup> These facts again emphasize the importance of using the smallest effective dose of prednisone for the shortest possible time.

Drug reactions are a second important impersonator of active SLE. NSAIDs rarely can produce meningitis and, not so rarely, renal disease.<sup>45</sup> Toxic levels of aspirin can produce breathlessness so that a salicylate level in the right patient can prevent a cumbersome pulmonary evaluation. Hydroxychloroquine is a rare cause of myositis. Even more dramatically, drugs such as penicillamine, procainamide, and hydralazine can cause SLE.<sup>46</sup> Consequently, before prednisone is initiated or increased, other possible explanations for the manifestations must be considered.

### Treatment of Specific Manifestations

**Cutaneous Manifestations.** Since many of the cutaneous manifestations of SLE are brought on or exacerbated by sunlight, the first step in treatment is to minimize sun exposure by avoiding direct sunlight, especially during midday hours, and by using wide-brimmed hats and sunscreen lotions.<sup>47-50</sup> Topical corticosteroids are effective for most skin lesions of SLE but are not practical for extensive involvement. Powerful fluorinated topical corticosteroid preparations are usually avoided for the face and used sparingly elsewhere because of the risk of disfiguring cutaneous atrophy with prolonged use. Intradermal injections of corticosteroids are effective for solitary, severe discoid lesions.

Oral therapy with the antimalarials hydroxychloroquine or chloroquine is frequently used to treat skin disease not amenable to topical therapy.<sup>51</sup> Hydroxychloroquine, the most commonly used agent, is usually very well tolerated. The most feared toxicity is decreased vision resulting from uptake of the antimalarials by the retinal pigmented epithelium.<sup>52-54</sup> The chance of retinal damage is very small (less than 1 percent) when the daily dose does not exceed 400 mg.<sup>52</sup> As an extra precaution, the patient should have an ophthalmologic evaluation initially and every six months thereafter. Many ophthalmologists will provide patients with charts that allow the patient to detect early any subtle deficiencies in color vision -- the first

symptom of retinal toxicity. Rarer side effects include myopathy, leukopenia, and cardiomyopathy. Gastrointestinal intolerance can usually be overcome by nighttime dosing. The major limitation of hydroxychloroquine is its slow onset of action (one to six months). Dapsone is an effective agent for certain forms of cutaneous lupus erythematosus, especially bullous lesions.<sup>55-57</sup> Drug-induced hemolytic anemia is common and must be monitored carefully with complete blood counts and reticulocyte counts. Glucose-6-phosphate dehydrogenase (G6PD) deficiency contraindicates the use of Dapsone.

Oral corticosteroids are very effective for cutaneous SLE but because of toxicity, they are used only when other agents have failed or the patient has other features of SLE (e.g., nephritis) that require oral corticosteroids.

**Arthritis and Arthralgias.** Nonsteroidal anti-inflammatory drugs (NSAIDs) usually effectively relieve the arthralgias or the arthritis of SLE. There is nothing to recommend any particular NSAID; all NSAIDs from the venerable aspirin to the latest new fangled NSAID are equally likely to be effective. If aspirin is chosen, an enteric preparation should be used to reduce the risk of gastric ulceration to the level seen with any of the newer NSAIDs.<sup>58</sup> A NSAID should be used for two to three weeks at full dose before considering a different one. The toxicity of NSAIDs in SLE is similar to that for other populations with the important exception that liver toxicity may be more frequent.

Hydroxychloroquine at 200-400 mg/d is also effective for SLE joint disease. A recent placebo-controlled study suggested that hydroxychloroquine reduces the risk not only of minor flares but also of major flares.<sup>54</sup> Because hydroxychloroquine is a slow-acting agent, requiring up to three to six months of use before becoming effective, initial concomitant coverage with NSAIDs may be required.

Systemic corticosteroids, in doses of 5-15 mg/d, dramatically eliminate or reduce arthritis. As with the treatment of skin disease, the availability of other effective and less toxic agents means that corticosteroids are rarely indicated in the treatment of arthritis alone.

**Serositis.** Pleuritic chest pain in the absence of other severe symptoms usually responds to NSAIDs.<sup>59,60</sup> Occasionally, severe pleuritis may require low doses of prednisone (10-20 mg/d).<sup>61</sup> Pericarditis of a very mild degree may respond to NSAIDs but frequently requires prednisone (10-20 mg/d). Higher doses are required if a more serious manifestation such as myocarditis is present.<sup>62</sup>

**Lupus Nephritis.** The importance of renal disease is emphasized by its frequency (seen in 50 percent of patients)<sup>35</sup> and severity (the second most common cause of death after infection).<sup>63</sup> Many studies in the last decade have helped define the course and response to therapy but therapeutic controversies remain.<sup>29-35,64-81</sup>

Perhaps no topic is more controversial than the role

of renal biopsy.<sup>72,76</sup> To a degree, the data are quite clear.<sup>35,76</sup> Renal biopsy does add prognostic information not otherwise available and does help predict who is most likely to lose renal function.<sup>35,76</sup> Somewhat surprisingly, the renal biopsy information that is most predictive is the level of scarring as measured by a chronicity index.<sup>35,76</sup> The World Health Organization (WHO) classification of lupus nephritis (including normal, mesangial, focal proliferative, diffuse proliferative, and membranous glomerulonephritis) does not add predictive power. With multiple studies reaching the same conclusion, the power of renal biopsy to add prognostic information is firmly established.

Better predictions do not, however, guarantee better therapies. There has been no prospective study to determine if the renal biopsy data can improve therapy and, therefore, the outcome. Should the presence of much scarring prompt aggressive therapy to prevent worsening? Or should such scarring indicate that the patient is very unlikely to benefit from any therapy and should, therefore, avoid the increased risk of a cytotoxic agent? Until these questions are answered, reasonable people will continue to debate the appropriateness of renal biopsy.

Much information has been gained on the efficacy of various treatments of one form of lupus nephritis -- diffuse proliferative glomerulonephritis.<sup>35</sup> These studies, chiefly from the National Institutes of Health (NIH), have demonstrated that cyclophosphamide therapy is more effective than prednisone in terms of preventing renal failure.<sup>35</sup> However, while cyclophosphamide therapy improves renal survival, it does not improve overall survival.<sup>35</sup>

Indeed, the toxicity of cyclophosphamide is substantial (Table 4).<sup>35</sup> Perhaps of most concern is that fully 18 percent of lupus nephritis patients treated long-term with oral cyclophosphamide have developed a malignancy.<sup>35</sup> Infections, especially with herpes zoster, infertility, and hemorrhagic cystitis, have dampened enthusiasm for this therapy.<sup>35</sup>

Such problems have sparked attempts to determine if alternative routes of administration might be as effective but less toxic. Specifically, intravenous, intermittent pulse cyclophosphamide therapy (.5 - 1.5 grams each month) has been tried.<sup>35</sup> The initial reports, based on a shorter and smaller experience than with oral cyclophosphamide, have been encouraging.<sup>35</sup> Intravenous cyclophosphamide does appear to reduce the chance of developing hemorrhagic cystitis, infection, and possibly malignancy.<sup>35</sup> Yet not all centers report such benign results; important infections, hemorrhagic cystitis, and malignancy have been associated

with intermittent pulse cyclophosphamide.<sup>82-84</sup> Until the long-term toxicity of pulse cyclophosphamide is known, such therapy should be recommended with great caution.

Other second-line agents (Table 3) have been used for lupus nephritis, including azathioprine and chlorambucil, but much less is known about their relative efficacies.<sup>33,75</sup> Throughout most of the United States, prednisone and cyclophosphamide are the most commonly used agents in the treatment of lupus nephritis.

Controversies involve not only which agent to use but also how SLE nephritis should be followed. What are the reliable markers of improvement or worsening? Specifically, several authors have shown that in many different forms of renal disease including lupus nephritis, serum creatinine and creatinine clearance are inaccurate measures of the glomerular filtration rate.<sup>65,69,85</sup> Unfortunately, an accurate, inexpensive, and widely available alternative does not yet exist.<sup>85</sup> Nuclear medicine techniques for measuring the glomerular filtration rate are accurate and available at some centers but are hospital-based and expensive.<sup>85</sup>

Other markers of renal disease activity deserve comment. It is important to recognize that proteinuria or hematuria can occur with either an active lesion or with a scarred one. On the one hand, an increase in hematuria or proteinuria usually indicates active disease. On the other hand, healed glomerulonephritis may result in stable, persistent minor hematuria or proteinuria. Complete restoration of the urine to normal may not always be possible; persistent minor abnormalities must be interpreted in the context of the entire clinical picture.

Often, assessments of renal disease activity will be influenced by serologic tests. Of all the organ system diseases, renal disease is the one in which serologic tests are most frequently meaningful.<sup>39</sup> Typically, with or before the onset of clinical nephritis, complement levels fall and anti-native DNA levels rise.<sup>36</sup> With successful treatment, the serologic abnormalities usually reverse.

It is important to recall that not all renal disease in patients with SLE is due to lupus. Lupus patients with a falling glomerular filtration rate should be subject to the same differential diagnostic considerations as any other patient. In particular, NSAID or other drug-induced renal insufficiency, urinary tract infection, obstruction, amyloid, and multiple myeloma are among the other reasons patients with SLE may develop renal insufficiency. Even with lupus nephritis, other related problems, such as renal vein thrombosis, may be responsible for some of the fall in glomerular filtration rate.<sup>77</sup>

This author rarely recommends that patients have renal biopsies since although this information improves predictions, it does not improve the treatment of lupus nephritis. Biopsies are recommended only

**Table 4. Major Toxicities of Cyclophosphamide**

Hemorrhagic cystitis
Infection (especially herpes zoster)
Gonadal failure (infertility, premature menopause)
Malignancy

when there is substantial doubt as to whether the renal disease is actually due to lupus. A young woman with a one-year history of lupus and a new nephrotic syndrome accompanied by a multiple organ system flare, red cell casts, hypocomplementemia, and markedly elevated anti-DNA, undoubtedly has lupus nephritis; a biopsy is not needed. On the other hand, a woman with a fifteen-year history of SLE which has never included renal disease who suddenly develops four grams of proteinuria with a normal urinalysis, normal serologies, and no other clinical evidence of SLE, should be suspected of having another cause of renal disease. Renal biopsy may be needed to provide the exact diagnosis. In the more common settings where lupus is clearly the cause, a biopsy is not needed.

Treatment of lupus nephritis should begin with prednisone at a dose of 40-60 mg/d. The cyclophosphamide bandwagon rolling across the nation should not, in the author's view, be jumped on too quickly. Some patients will respond to two to three months of prednisone and can be spared exposure to cyclophosphamide -- a drug that helps save kidneys but not lives. If the patient does not respond to prednisone -- as defined by an overall assessment of urine sediment, proteinuria, glomerular filtration, and serologic tests -- then an immunosuppressive drug such as cyclophosphamide can be added for a three to six month trial. Once an immunosuppressive drug is active, the prednisone should be tapered to less than 20 mg/d. The greatest risk of an opportunistic infection appears to be in those patients taking both high-dose prednisone and an immunosuppressive drug.

The risk of neoplasia associated with immunosuppressive drugs makes it essential to keep the exposure to these agents to as short a time as possible. Most patients will achieve a maximal response by three to six months; thereafter, deliberate tapering should proceed.

At every juncture in the treatment of lupus nephritis, the physician should ask, "are the benefits of additional aggressive treatment likely to exceed the risk?" The patient with a recent onset of nephritis and a large reserve of renal function is likely to benefit from aggressive treatment. But a patient with a history of SLE, diabetes, hypertension, and a chronically progressive renal failure with a current serum creatinine of 5 mg/dl may not; aggressive or prolonged therapy may have greater risks than benefits. This is particularly true since the management of end-stage renal failure secondary to SLE is generally as successful as it is in other diseases.<sup>66</sup> Indeed, most, but not all, SLE patients who develop end-stage renal disease experience a remission of the lupus in other organ systems.<sup>66,70</sup> Renal transplantation has been shown to be very effective in SLE. Reoccurrence of renal disease after transplant is rare.

As in any form of renal disease, careful attention to blood pressure control and diet, and avoidance of potential nephrotoxins are important adjunctive measures.

**Neuropsychiatric SLE.** The treatment of the neuropsychiatric manifestations of SLE is extremely challenging for several reasons. First, neuropsychiatric disease is very heterogeneous.<sup>86-96</sup> Second, some of the neuropsychiatric manifestations can be devastating.<sup>86-96</sup> Central nervous system (CNS) lupus is second only to renal disease as the form of disease activity most responsible for deaths.<sup>63</sup> Third, the clinician must always keep in mind that other disease processes, especially infection and drug reactions, can mimic CNS lupus.<sup>9</sup> Fourth, the laboratory tests, in contrast to renal disease, have many more limitations in establishing a diagnosis.<sup>86,87,93,95</sup> Indeed, the diagnosis of neuropsychiatric lupus is often based on an exclusion of other causes; the presence of active lupus in other organs is not necessary but when present does help confirm the diagnosis. Fifth, and also in contrast to renal disease, much less is known about the efficacy of therapy. The treatments of the different manifestations vary sufficiently to require separate discussions for the major nervous system manifestations.

**Depression** is the most common of the neuropsychiatric manifestations of SLE and can be part of the emotional (and understandable) reaction to the situation or it can be precipitated or aggravated by prednisone.<sup>86</sup> Whether SLE itself can biologically cause depression is not established. The treatment of reactive depression in lupus is similar to that for any reactive depression; compassion, understanding, and encouragement are usually sufficient but psychotherapy, possibly with antidepressants, may be required in some cases.

**Neuropsychiatric effects of prednisone** occur frequently and range from mild anxiety or depression to full-scale psychosis.<sup>86,87</sup> Individuals show enormous variation in susceptibility to these effects. While some effects can be seen in some individuals at any dose, the effects are more frequent and more severe at the higher doses. Differentiating these drug-induced changes from active SLE is often difficult and sometimes impossible strictly on clinical grounds. In such cases, only an empiric careful tapering of prednisone clarifies the picture.

When persistent activity in other organs demands aggressive therapy despite disabling prednisone effects on the central nervous system, substitution with an immunosuppressive agent may be indicated. Judicious use of antidepressants or anxiolytic agents can palliate the symptoms and allow continued use or slow reduction of prednisone.

**Seizures** occurring in the setting of active CNS lupus -- as perhaps manifested by an abnormal cerebral spinal fluid and active SLE in other organs -- should be treated with both high-dose prednisone (e.g., 60-80 mg/d of prednisone or equivalent in divided doses) and anticonvulsants.<sup>86</sup> The choice of anticonvulsant depends on the type of seizure. Grand mal seizures are usually treated with phenytoin.

Traditionally, psychosis and organic brain syndrome

are treated with high-dose corticosteroids (e.g., prednisone 50-80 mg/d in divided doses) but the responsiveness is at best, slow.<sup>86</sup> Several weeks or longer may pass without substantial improvements. Thus, in the case of psychosis, antipsychotic medications -- especially haloperidol -- may be at least as important as prednisone in the early treatment.

Contrary to common belief, visible vessel vasculitis makes up no more than approximately 10 percent of all cases of CNS lupus.<sup>86,92</sup> The consequences of this infrequent form, however, are profound, with major stroke syndromes possible. The first issue is to establish the cause. Active SLE elsewhere provides strong circumstantial evidence that SLE vasculitis is at work. Hypocoagulable states due to the lupus anticoagulant, emboli from endocarditis, vasculopathies from cocaine or amphetamine abuse, and arteriosclerotic vascular disease, all must be considered as possible etiologies. CNS vasculitis is usually treated with high doses of prednisone (60-80 mg/d of prednisone or equivalent) for at least one to two months before beginning a slow tapering.

**Transverse myelitis** can be a rapidly devastating lesion which may be halted and, less commonly, reversed by immediate use of high-dose prednisone.<sup>89,96</sup> Yet even with rapid therapy, morbidity and mortality are substantial.<sup>86</sup>

**Peripheral nervous system lesions** may exist as a stocking glove peripheral neuropathy or as a mononeuritis multiplex.<sup>97</sup> The latter form is probably due to small vessel vasculitis requiring high-dose prednisone.

**Pulmonary Effects.** **Pleuritis** is the most common clinical pulmonary manifestation of SLE.<sup>1,5,59,60,98</sup> Pleuritic pain in the absence of clinical signs will often respond to NSAIDs. If a rub or an effusion is present, low-dose prednisone (10-20 mg/d) is usually required. It should be emphasized that the differential diagnosis of pleuritis in SLE is large and, in addition to active SLE, includes pulmonary emboli and infection. Infection should be pursued vigorously if the patient has risk factors (e.g., on 20 mg/d of prednisone or an immunosuppressive drug). Lupus lung disease does not produce cavities or large pleural effusions. Any deviation from this radiographic picture should be aggressively investigated. Patients with the lupus anticoagulant or other known risk factors for thrombosis should have pulmonary emboli excluded.

Clinically, prognostically, and therapeutically, **pneumonitis** and **pulmonary hemorrhage** are similar.<sup>98,99</sup> The effective therapy for diffuse inflammatory pulmonary infiltrates is not known, as is evident from the 50 percent mortality reported with this process.<sup>98</sup> Certainly excellent critical care and exclusion of other causes are the first steps. Aggressive therapy (60-100 mg/d of prednisone or equivalent in divided doses intravenously) is warranted. A shock-lung-like picture develops in many patients, probably secondary to leaky

capillaries. The body's limited capacity to heal such lesions quickly, despite control of the inflammation, is probably the factor that most heavily determines survival.

**Pulmonary fibrosis** is also known as the shrinking lung syndrome. This subacute process often occurs in the absence of multi-organ inflammation and only becomes evident once restriction is at least moderately severe.<sup>100</sup> Whether the patient has active pulmonary inflammation is difficult to ascertain as large studies on the utility of bronchoalveolar lavage, gallium scanning of the lungs, and other techniques have not been performed. In clinical practice, if other non-lupus causes can be excluded, a several month trial of 40-60 mg/d of prednisone followed by pulmonary function testing will demonstrate whether a reversible component is present.

Symptoms from **pulmonary hypertension** are a late development and are usually unresponsive to conventional therapy with vasodilators.<sup>101-104</sup> Still, a right-heart catheterization to monitor empiric therapeutic trials is reasonable and is offered by tertiary medical centers.<sup>103</sup> Prednisone or immunosuppressive drugs appear to have little or no role, as the disease process -- at least at the time of detection -- is a bland vascular one. Rarely, pulmonary hypertension is a consequence of severe interstitial disease.<sup>101</sup> The benefit of long-term anticoagulation to prevent secondary thromboembolism has not been established.

**Cardiac Manifestations.** **Pericarditis** promptly responds in most cases to low doses of prednisone (10-20 mg/d). Physicians may use NSAID-like indomethacin 50 mg tid but usually in an effort to reduce rather than eliminate corticosteroids.<sup>61</sup>

**Myocarditis** is a potentially life-threatening complication that demands hospitalization and intravenous high-dose prednisone.<sup>62</sup> Intensive care unit monitoring may be needed for critically ill patients in tenuous fluid balance. While the diagnosis of myocarditis secondary to SLE is usually clear-cut on serologic and clinical grounds, the differential diagnosis needs careful examination. Whether right-heart catheterization and myocardial biopsy are needed must be decided on an individual basis.<sup>105</sup>

**Libman-Sacks endocarditis** is usually clinically silent but can cause hemodynamically important valvular dysfunction.<sup>106-109</sup> In recent times, mitral valve disease has been the most common but any valve can be affected.<sup>109</sup> The dysfunction is the result of previous inflammation or thrombus formation around the valve.<sup>109</sup> Thus, the problem is mechanical rather than inflammatory and, if severe, demands a mechanical solution (i.e., valve replacement).<sup>109</sup> Anti-inflammatory or immunosuppressive therapy is not indicated for valvular dysfunction alone. Libman-Sacks endocarditis can be a site for massive thrombosis and subsequent emboli -- especially in patients with the lupus anticoagulant.<sup>107,109</sup> Any valvular abnormality can also provide a nidus for developing bacterial endocarditis.

**Coronary artery disease** is most commonly second-

ary to atherosclerosis, which can be accelerated by prednisone use.<sup>110-112</sup> Vasculitis of the coronary arteries is rare.<sup>62</sup>

**Hematologic Manifestations.** **Thrombocytopenia** is the most commonly treated hematologic manifestation of SLE.<sup>113-122</sup> The intensity of treatment must match the severity of the problem. Platelet counts of 50,000/mm<sup>3</sup> or greater, rarely are associated with clinical bleeding, and do not require treatment. Below a platelet count of 50,000, the risk of bleeding increases and treatment is usually indicated.

Though many treatments have been tried (Table 5), prednisone is still the standard.<sup>113-122</sup> Initiated at 40-80 mg/d in divided doses, prednisone may not improve the platelet count for ten to fourteen days. When such a wait could be life-threatening, intravenous gammaglobulin can be added, as that therapy usually raises the platelet count within one to three days.<sup>118</sup> Since the effect is not long-standing, adjunctive use of prednisone is indicated.

While most patients will respond initially to high-dose prednisone, many experience exacerbations as the prednisone is tapered. The toxicity of high-dose prednisone makes chronic therapy intolerable and has, therefore, prompted the search for the alternatives listed in Table 5.<sup>113-115</sup> Each therapy has its advocates and detractors. The lack of comparative trials fuels and maintains this debate.

**Hemolytic anemia** can be a life-threatening emergency.<sup>122,123</sup> Rapid declines in hematocrits from 40 to 13 percent can occur in a matter of days. Patients with such severe hemolysis need urgent admission and immediate treatment with high-dose prednisone (60-100 mg/d in divided doses given intravenously). Transfusion can be difficult but should be provided whenever the anemia is life-threatening. Tapering is not attempted until the hematocrit, peripheral blood smear, and reticulocyte count demonstrate that the hemolysis has stopped and that the red blood cells have been replenished.

One of the murkiest issues in clinical lupus today is the management of a **lupus anticoagulant**.<sup>124-130</sup> Several recent studies have helped clarify some of the answers. First, only patients who have both a lupus anticoagulant and who have had a thrombotic event are candidates for warfarin therapy. Though the lupus anticoagulant in its many different forms is present in

7 to 30 percent of all patients, the risk of thrombosis to any one patient is low; approximately three thrombotic events occur every 100 patient years.<sup>131</sup> Thus, the treatment of all patients with the lupus anticoagulant would not be cost-effective and the risk of anticoagulation would exceed the benefits. Even for patients with a history of thrombotic events and a lupus anticoagulant, therapy is controversial. Cases of repeated thrombotic events while on aspirin have prompted the use of warfarin, though the benefits of such therapy have not been established in controlled clinical trials. It is hoped that future studies will help identify more precisely the subgroup of patients at risk and the optimal therapy.

**Abdominal Vasculitis.** Mesenteric ischemia from abdominal vasculitis is one of the most feared complications of SLE.<sup>132,133</sup> Once suspected, the treatment includes high-dose prednisone to halt the inflammatory destruction of vessels. If the clinical picture does not improve rapidly, bowel gangrene should be suspected; emergent laparotomy will be needed.<sup>132,133</sup> Despite aggressive therapy the mortality from this complication remains high.<sup>132,133</sup>

## Conclusion

Over the last three decades, advances in the treatment of lupus have transformed it from an acute and often fatal disease to a chronic illness compatible with a normal life span. The reality of lupus as a chronic disease has several therapeutic implications. First, the importance of a compassionate, understanding, and communicative physician is greater than ever. Nowadays, the effective clinician not only treats acute flares but also educates and counsels about the effects of an illness on job, marriage, children, and on almost every other dimension of a patient's life. Second, lupus as a chronic disease has demonstrated the need to reduce the toxicity of corticosteroids -- especially in terms of infections, accelerated coronary artery disease, and avascular necrosis of bone. To preserve the gains provided by corticosteroids while reducing the side effects is the chief therapeutic challenge of today. The possibilities of more selective and more effective therapies promise that the prognosis for patients with SLE will continue to improve.

# ***The Personality Disorder Treatment Program of Sheppard Pratt Hospital***

Very often, specialized inpatient evaluation and treatment is a critical step in the effective care of a borderline patient.

The Personality Disorder Treatment Program at Sheppard Pratt offers a combination of services that may help to untangle difficult clinical questions and facilitate your patient's continued outpatient treatment.

We offer:

- ☐ Short-term and intermediate-term specialized inpatient treatment
- ☐ Extended-term intensive inpatient treatment
- ☐ Comprehensive diagnostic evaluation
- ☐ Psychotherapy and psychopharmacology consultation
- ☐ Intensive individual and group psychotherapy provided by our staff of psychiatrists and psychologists
- ☐ Long-term treatment planning

If you would like to know more about the Sheppard Pratt approach to the borderline patient and other patients with severe personality disorders, contact the Adult Admissions Office at:

(301) 938-3800  
6501 North Charles Street  
Baltimore, Maryland 21285-5815

# SLE: Management Overview

---

Joan D. Sutton RN, MSN

---

*Ms. Sutton is Instructor in Medicine, The Johns Hopkins University School of Medicine, Baltimore, MD.*

---

*Patients with systemic lupus erythematosus can often benefit from cooperative and collaborative interventions prescribed by both physicians and other arthritis health care professionals.*

---

Over the last twenty years, rheumatology has emerged as a primary area of interest for many health professionals including nurses, physical and occupational therapists, social workers, and specialists from a variety of other disciplines. The Arthritis Health Professions Association (AHPA), a professional section of the National Arthritis Foundation, is a multidisciplinary organization with approximately 2,000 members from more than fourteen disciplines.

Patients with systemic lupus erythematosus (SLE) often benefit from the cooperative and collaborative interventions prescribed by physicians and other arthritis health care professionals. The complexity of the illness, varying among individuals and within the same individual over time, precludes a single formula for meeting patients' needs. The long-term management of patients with SLE requires not only drug therapy but also selective interventions by multiple health professionals.

## Management

**General Features.** Constitutional symptoms (fatigue, fever, and weight loss) may be early manifestations of SLE and may occur periodically during the course of the disease. In addition to being a frequent and consistent complaint, fatigue occurs in the majority of patients experiencing a flare in their disease process.<sup>1</sup> Factors that contribute to the severity and duration of fatigue may include physical and emotional stress, decreased self-concept, decreased performance of daily activities, reduced sexual activity, and poor nutritional and sleeping habits.<sup>2</sup> Since corticosteroid therapy is effective in minimizing fatigue and in improving a patient's sense of well-being, compliance with the prescribed medication regimen is essential. In addition, the patient and his or her family should be instructed in principles of energy conservation such as pacing activities, planning and organizing priorities, and balancing normal activities with periods of rest.<sup>2</sup> Effective coping strategies may include the use of relaxation techniques, recreational activity, and open communications with significant others.

Emotional factors are equally as important as physical ones, in that emotional factors may play a role in triggering an acute attack. Emotional, psychosocial issues may include initial depression and grief, changes in body image, loss of control, fear of the unknown, increasing medical bills, and employment concerns.<sup>3</sup>

Recently, many studies have been conducted in an effort to further define disability, and the psychosocial and emotional concerns of the patient with lupus. In one study,<sup>4</sup> 106 ambulatory outpatients with SLE completed the Stanford Health Assessment Questionnaire (HAQ) and the Psychosocial Adjustment to Illness Scale (PAIS). Mean HAQ disability, pain, and global assessment scores indicated a mild degree of impairment, whereas correlations were observed between increased disability, increased pain, worsened global assessment, and poor psychosocial adjustment across all domains of the PAIS. These data suggest that functional and psychosocial impairment are present in patients with SLE.

In a second study,<sup>5</sup> the physical manifestations of disease activity and health status of forty-nine patients with SLE were studied. Each patient completed the Arthritis Impact Measurement Scale (AIMS) and physical features were documented by a Clinical Activity Index (CAI). Results from this study showed a significant correlation between health status and disease activity.

A third study<sup>6</sup> reported on the social functioning of 114 women with SLE. Results showed that social difficulties worsened with disease exacerbations, drug reactions, and delays in diagnosis. The study also showed that SLE was not a barrier to marriage nor a primary cause of divorce. The conclusion in this and other studies was that patients with SLE can function well socially, but that it is also important for health care providers to be alert to problems and to render support when needed.

Fever is present in approximately 90 percent of patients with SLE,<sup>1</sup> and may occur periodically throughout the course of the disease or as a result of infection. Weight loss, present in about 85 percent of patients being diagnosed, and during periods of exacerbation,<sup>1</sup> may necessitate specific dietary instruction. Dietary counseling may also be necessary for those patients experiencing weight gain (often with corticosteroids) and those with gastrointestinal disorders and food intolerances.

**Musculoskeletal.** It is reported that approximately 95 percent of patients with SLE have arthritis or arthralgias, the most frequent manifestations of this disorder.<sup>1</sup> In addition, approximately 30 percent of patients experience myalgias, with myositis occurring less frequently.<sup>1</sup> Weakness and muscle atrophy are relatively frequent and may occur secondarily to the disease process or as sequelae to corticosteroid therapy. Steroid myopathy is characterized by symmetrical weakness in the lower proximal muscles, progressing to the proximal upper extremity muscles. Rarely is the distal musculature involved. Generally, steroid myopathy is insidious, with

the first symptom being difficulty in ascending stairs or rising from a chair.

When musculoskeletal manifestations are apparent, it is advisable for patients to be instructed in an exercise program, preferably by a physical therapist. Permanent structural deformities rarely occur in SLE, but transient and recurrent impairment in locomotor function can occur.<sup>7</sup> A physical therapist can evaluate the musculoskeletal system by assessing such factors as range of motion, muscle strength, gait, mobility, functional ability, and the need for special footwear and mobility/assistive devices.<sup>8</sup> An exercise program may be therapeutic, recreational, or a combination thereof. Therapeutic exercise may include strengthening (i.e., isotonic, isometric), and range of motion (ROM) exercises. Suitable recreational exercises include walking, swimming, bicycling, light racquet games, and dancing. Generally, patients with musculoskeletal complaints should avoid contact sports, activities that cause impact to the joints, and highly competitive team sports.<sup>9</sup> A pilot study exploring the effects of aerobic conditioning in SLE patients has been conducted. After an eight-week aerobic conditioning program, twenty-three patients with SLE increased their aerobic capacity by 19 percent compared to 8 percent in controls. In addition, this change correlated with decreased fatigue, measured by visual analog scales.<sup>10</sup>

Routinely, patients on steroids should be instructed in a preventive exercise program to strengthen hip and knee extensors in order to forestall steroid myopathy. With knees extended, and in a supine position, the patient exercises one leg at a time. With a stiff knee and toes pointed stiffly toward the ceiling, the patient bounces the stiff leg lightly and rapidly several inches against the surface. The number of leg bounces should increase with time.<sup>7</sup>

Additionally, occupational and physical therapists and nurses may be instrumental in helping the patient to become or remain functionally independent with the help of assistive/adaptive devices. Frequently, patients with SLE require reassurance regarding the mild nature of their musculoskeletal problems, in that serious impairment is rare.

**Dermatologic.** Abnormalities of the hair, skin, and mucous membranes are the second most common manifestations of SLE, occurring in approximately 85 percent of patients.<sup>1</sup> Alopecia (hair loss) is one of the most common cutaneous signs of SLE. Alopecia may be scarring or nonscarring. Diffuse nonscarring alopecia occurs most frequently during the acute exacerbations of the disease.<sup>11</sup> Patients should be reassured that generally, hair loss is not permanent. However, in about 20 percent of patients, hair loss is so diffuse that the purchasing of a hairpiece becomes necessary.<sup>1</sup>

Skin lesions and photosensitivity are common in patients with SLE. Photosensitivity occurs in approximately one-third of patients with SLE and may be associated with arthralgias, fever, and other systemic

manifestations.<sup>3</sup> Photosensitive patients should be advised (1) to avoid direct sun exposure, particularly between 10:00 am and 4:00 pm; (2) to wear protective clothing such as wide-brimmed hats and long sleeves; and (3) to apply sunscreens and lip protectors with a sunscreen protective factor (SPF) of fifteen or more. Sunscreens should be applied thirty minutes before sun exposure and reapplied after bathing or swimming.<sup>11</sup>

Patients should be advised that there is more reflection of ultraviolet rays near water and snow, and that glass, such as car windows, may provide little protection.<sup>3</sup> The hospitalized patient with SLE may require a bed away from the window.

Fluorescent lamps and sunlamps constitute other sources of ultraviolet (UV) light. Fluorescent light may cause or exacerbate lupus rashes or other symptoms. Reduction of UV emissions may be accomplished by the use of a commercially available shield.<sup>12</sup>

Caution should be used when trying any new over-the-counter preparations, in that hair dyes, permanent wave solutions, skin creams, and make-up may aggravate or cause skin eruptions. It is recommended that patients do a patch test on the inside of the forearm or back of the ear before applying topical preparations to larger areas.<sup>3</sup> Likewise, caution should be employed when using over-the-counter medications.

Mucosal ulcers are common in patients with SLE. These ulcerations are generally found on the hard or soft palate and are generally asymptomatic. However, they may cause pain when patients eat spicy foods. Xylocaine or a local anesthetic may help to alleviate this discomfort.

### Special Problems

*Ischemic Necrosis of Bone.* One of the most disabling complications of SLE is ischemic necrosis of bone, also known as osteonecrosis or aseptic and avascular necrosis. Ischemic necrosis, most frequently involving the femoral heads, reflects an alteration in the blood supply and increased intramarrow pressure at the involved sites. It should be noted that avascular necrosis rarely occurs in SLE patients who are not receiving corticosteroids.<sup>13</sup>

Treatment in the early phases (Stages I and II) of osteonecrosis is aimed at promoting revascularization and prevention of collapse. Nonsurgical treatment includes the use of nonsteroidal anti-inflammatory drugs (NSAIDs) and the use of a cane or crutches. The results of this conservative approach have been disappointing and, consequently, core decompression is recommended as an early intervention. Osteotomies have also been used to prevent collapse of the femoral head. Results have been variable and postoperative management includes crutch-walking for six to twelve months. Finally, a total joint replacement may be indicated for Stages III and IV in which advanced structural changes have already occurred. Risks from this proce-

dures include dislocation, pulmonary embolism, infection, and loosening of the prosthesis. Assistive and/or ambulatory devices may be required, at least initially, for patients having undergone these procedures.

*Osteoporosis.* It is reported that osteoporosis is perhaps the most common and potentially devastating effect of corticosteroid therapy. Patients receiving steroids develop negative calcium balance and approximately 40 percent develop clinically significant osteoporosis.<sup>14</sup> Bone studies from patients undergoing prolonged treatment with glucocorticoids have shown decreased rates of bone formation and increased rates of bone resorption. Bone loss characteristically involves trabecular bone in the ribs, vertebrae, and distal radius; consequently, rib fractures and vertebral compression fractures of the thoracic and lumbar spine are common in SLE patients treated with corticosteroids.<sup>14</sup>

Treatment of symptomatic osteoporosis has had limited success, and it is suggested that prevention is a more useful approach in persons at high risk. Preventive measures may include regular exercise against gravity (e.g., walking, tennis, and exercise classes), and an adequate daily intake of calcium and Vitamin D. Daily calcium supplementation may be indicated for patients with SLE, particularly for those women who are postmenopausal. It is also suggested that cyclical estrogen replacement is the most effective preventive measure in preventing osteoporosis.<sup>15</sup>

Treatment of symptomatic osteoporosis should include the aforementioned interventions, and consideration should be given to the use of calcitonin<sup>16</sup> and fluorides.<sup>17</sup> In addition, lupus patients with vertebral compression may require the use of a back brace, bed board, or ambulatory aids.

*Education.* The relapsing and remitting clinical course of SLE in any given individual requires attention to both the acute and chronic aspects of this disease. In all phases of the disease, education is an extremely important aspect of management. Educational needs may be most important at the time of diagnosis, but should be realized throughout the disease process. Prior to implementing an educational program, determination of the patient's level of understanding and of his or her fears and concerns must be made.

Education relative to the disease process may include information regarding signs and symptoms, exacerbations and remissions, laboratory data, prognosis, psychosocial implications and information regarding pregnancy for female patients of childbearing age. Specific treatment goals and modalities with a rationale for each should be included in the educational program.

Excellent educational resource materials are available for patients.<sup>18</sup> Some may be obtained from The Lupus Foundation, the National Institutes of Health's Arthritis Information Clearinghouse, and the National Arthritis Foundation. Locally, information may be obtained from the Maryland Chapter of both the Lupus and the Arthritis Foundation. Discussion and support

groups for patients, their families, and their friends are also sponsored by these organizations.

### Conclusion

Nurses and arthritis health professionals have unique and specialized knowledge and expertise which may serve to complement and supplement that of the physician. The short-term and long-term management of patients with SLE may optimally be achieved by the involvement of a variety of health professionals capable of addressing many of the nonpharmacologic needs of this population as well as monitoring drug therapy.

# Lupus. When your body becomes its own worst enemy.

As a practicing physician you want the best possible care for your lupus patients.

The Maryland Lupus Foundation works in partnership with you to help your patients and their families cope with the physical, emotional, social, and economic effects of this serious, debilitating disease.

Whether it is through our education programs, support groups, or counseling and referral services, our sensitive staff brings your patients the latest information on lupus and helps ease the burden of the disease.

Also, our Medical Advisory Board promotes the funding of research related to lupus, facilitates the exchange of information among health professionals and collaborates with the medical community to improve the standards of diagnosis and treatment to those afflicted by lupus.

For more information on our services call (301) 337-9000

# "We've tried other or exist—without

*"The business of medicine has gotten so complicated, there's no way we could have continued to manage the practice without the right kind of automation. Now, with our Keystone system, the staff can respond to all our requests — patient requests, too — in no time flat. And KMS is what you'd call user friendly... everyone's happy with it."* Charles W. Kinzer, M.D.,

The KMS practice management system enables you to streamline office operations quickly and realize dramatic increases in efficiency. Time spent shuffling papers can be devoted to patient care — and growing your practice.

*"We're using their Intelligent Payment Posting module. It's saved us 16% in staff hours in one office, 25% at another. That's part of the reason we selected Keystone: efficiency. We also chose them for their flexibility, support and long-term commitment."* Benjamin L. Levin

Annapolis, MD*

## OFFICE AUTOMATION FROM KEYSTONE

# systems and realize we can't grow— our computer from Keystone."

Carol Matthews, President  
Eastern Medical Management, Inc.  
Pittsburgh, PA

"We've been with Keystone for eight years. They've always provided us with options as we've grown and done whatever it takes to keep the system up and running. Their support is worth every penny." Carol Matthews

Keystone has designed a system that allows you to start with the basics (Accounts Receivable, Billing, Practice Analysis and Electronic Claims) and add on other capabilities as you need them. KMS gives you a clear picture of your involvement with the patient — and provides you with all pertinent information instantly and automatically. Using the KMS modules receiving information from the industry and our clients are Patient Scheduling, Intelligent Payment Posting, and Credit and Collections.

"We were searching for a company sophisticated enough to support the growing demands of our company, and we found that in Keystone. The KMS Credit and Collections module allowed us to convert from a manual collections system that took forever to a computerized system that saves us 25% in manhours — without having to change our collections style one bit." Cindy Groux

"Their system ties all of our offices together, letting us keep track of everything that goes on — every facet of the practice — electronically. We feel secure that the business end is running expertly and efficiently. When I think how inaccurate we might have been before KMS, I know we couldn't survive now without it." Paul J. Killian, M.D.

Paul J. Killian, M.D.

## Treatment of Early-Stage Breast Cancer: Summary of the National Institutes of Health (NIH) Consensus Statement

**C**arcinoma of the breast is the most common cancer in women in the United States, and incidence of the disease has been increasing steadily. It is estimated that more than 1.5 million women will be diagnosed with breast cancer in the 1990s. The increased number of reported cases of breast cancer may be partly attributable to more widespread use of screening mammography. Tumors are also being detected at the smaller, more treatable stages of the disease. Of the 150,000 new patients diagnosed with invasive breast cancer in 1990, 75 to 80 percent will have early stage (clinical stage I or II) disease, and about two-thirds of these cases will not involve the axillary lymph nodes (node-negative disease).

Surgery alone was the traditional treatment for breast cancer during most of the twentieth century, and over the last decade, treatment has evolved from radical mastectomy to less extensive but equally effective modified mastectomy. Further studies have compared different approaches to more conservative equally effective surgery, including breast conservation therapy. Breast conservation therapy is a combination of surgery to remove the tumor and a small margin of unaffected tissue, removal and examination of underarm lymph nodes, and radiation treatment to the breast. The appropriate use of breast conservation therapy involves a variety of clinical, biological, and psychosocial factors.

Also in the last decade, adjuvant therapy has been the standard of care for the majority of breast cancer patients whose cancer has spread to the axillary lymph nodes. Several trials have recently shown an improvement in disease-free survival for node-negative breast cancer patients who receive adjuvant therapy. Although node-negative patients are considered to have a relatively favorable prognosis, they are still at risk for disease recurrence. About 30 percent of node-negative breast cancer patients will have disease recurrence. A plethora of potential prognostic factors to define an individual's risk of recurrence have been proposed, and their efficacy has been the subject of controversy.

To evaluate the research on these subjects, the National Cancer Institute and the National Institutes of Health's (NIH) Office of Medical Applications of Research sponsored a Consensus Development Conference on the Treatment of Early-Stage Breast Cancer on June 18-21, 1990. Based on scientific presentations and discussions from physicians, scientists, health care professionals, and the general public, a fifteen-member panel wrote a consensus statement. Following are the panel's findings:

- Breast conservation treatment is an appropriate method of primary therapy for the majority of women with Stage I and II breast cancer, and is preferable because it provides survival equivalent to total mastectomy and also preserves the breast. Total mastectomy remains an appropriate primary therapy when breast conservation is not indicated or selected. Both surgical therapies are accompanied by axillary dissection, which provides important prognostic information.
- The objective of breast conservation treatment is to obtain a

high probability of local disease control with survival at least equivalent to that obtained with total mastectomy, combined with maximal cosmetic results, and maintenance of normal function. The most widely employed treatment that achieves these goals is the combination of excision of the primary tumor with clear margins, level I-II axillary dissection, and post-operative radiation therapy to 4,500 to 5,000 centigrays with or without a boost.

- The majority of patients with node-negative breast cancer are cured by surgery or by surgery and radiation without further therapy. There is clear evidence that the rate of local and distant recurrence is decreased by both adjuvant combination cytotoxic chemotherapy and by adjuvant tamoxifen. Data from the ten randomized trials reviewed show that adjuvant systemic therapy reduces the rate of disease recurrence by about one-third. The role of these treatments in improving overall survival and other important parameters, such as quality of life, is still being defined.
- The decision to use adjuvant treatment should follow a thorough discussion with the patient regarding the approximate risk of relapse without adjuvant therapy, the expected reduction in risk with adjuvant therapy, toxicities of therapy, and its impact on quality of life. The many unanswered questions in the adjuvant systemic treatment of node-negative breast cancer make it imperative that all patients who are candidates for clinical trials be offered the opportunity to participate.
- Prognostic factors should be used to provide an estimate of risk of recurrence in women with early-stage breast cancer. Although no individual patient can be assured that she has no risk of recurrence, the majority of women will be cured with local/regional therapy.
- A useful prognostic factor has significant and independent predictive value that has been validated by clinical testing; its determination must be feasible, reproducible, and widely available with quality control; and it must be interpretable by the clinician and have therapeutic implications. Tumor size, estrogen and progesterone receptor status, nuclear grade, histologic type, and proliferative rate are useful prognostic factors, and other factors are under investigation.
- Outside of clinical trials it is reasonable not to employ adjuvant therapy in patients with tumors less than or equal to 1 centimeter in diameter because their chance of recurrence is less than 10 percent in ten years. With increasing tumor diameter, adjuvant systemic therapy is a reasonable therapeutic option.
- In patients with tumors larger than 1 centimeter in diameter, other prognostic factors should be weighed in the decision to employ adjuvant treatment. A major goal is the development of a risk profile system with sufficient accuracy and reproducibility to estimate prognosis in the individual patients.
- Future research should include determining optimal surgical and radiation techniques; refining current knowledge of chemotherapy regimens and tamoxifen therapy; developing a risk factor profile system to identify patients who could avoid systemic therapy, axillary node dissection, or radiation after breast sparing surgery without sacrificing survival; and assessing quality of life parameters in future clinical trials.

Free, single copies of the complete *NIH Consensus Statement on Treatment of Early-Stage Breast Cancer* may be ordered from the Office of Medical Applications of Research, National Institutes of Health, Building 1, Room 260, 9000 Rockville Pike, Bethesda, MD 20892 (301-496-1143).

### Treatment of Early-Stage Breast Cancer: Commentary and Counterpoint

Unlike the first two National Institutes of Health (NIH) consensus development conferences on breast cancer in July 1980 and September 1985, which were concerned with the adjuvant chemotherapy of breast cancer, this latest conference in June 1990 dealt with the treatment of early-stage breast cancer. What follows is a commentary and counterpoint to the summary findings of the conference from the point of view of a practicing medical oncologist.

There were five main questions addressed by the panel.

#### 1. What are the Roles of Mastectomy versus Breast Conservation in the Treatment of Early-Stage Breast Cancer?

The panel concluded that breast conservation treatment is an appropriate method of primary therapy for the majority of women with stage I and II breast cancer, and is preferable because it provides survival, equivalent to total mastectomy, and also preserves the breast. The complete consensus statement does point out that certain women are not candidates for breast conservation treatment, such as:

- women with multicentric breast malignant neoplasms, including those with gross multifocal disease or diffuse microcalcifications detected by mammography,
- women whose tumors are large relative to breast size, and
- women with certain pathologic and clinical features such as the presence of extensive intraductal carcinoma within and adjacent to the primary tumor, extensive lymphatic involvement, and young age (less than thirty-nine years).

The panel's opinion on the first question represents a calculated overstatement because breast conservation treatment is not commonly done nationwide and there are certain areas of the country where it is not being offered at all. I agree with the exclusion of women with certain pathologic and clinical features but feel that some women under thirty-nine years of age can be candidates for conservative treatment if their breasts are not too large or too firm. Women excluded because of certain pathologic and clinical features could be offered reconstructive surgery after a modified radical mastectomy if cosmesis is a desired goal. Nowhere in the full statement is any mention made of the risks of radiation therapy sometimes due to the overlap of radiation treatment fields, such as local radiation reaction with scar formation, as well as telangiectasis and fibrosis.

In my opinion, breast conservation treatment should not be considered the preferred method of treatment for the *majority* of women, although it is certainly appropriate in many cases after breast size, tumor size, the presence of extensive intraductal carcinoma, extensive lymphatic involvement, possible radiation reac-

tion, and the desire for reconstructive surgery have all been carefully considered.

Finally, assessment of the patient's wishes are of paramount importance. For many patients, the removal of the breast provides an important sense of security which may outweigh concerns regarding body image and sexuality.

#### 2. What are the Optimal Techniques for Breast Conservation?

The panel recommended the following techniques for breast conservation:

- a. Local excision of primary tumor with clear margins; when the margins are grossly involved with tumor, further resection is indicated.
- b. Stage I-II, axillary node dissection.
- c. Breast irradiation to 4,500-5,000 cGy with or without a boost.

I am in agreement with all the statements made regarding this question and would underscore the point regarding booster irradiation. Booster irradiation has been used in the majority of trials to date. Some of the evidence available suggests that not all patients receiving radiation therapy need to have a boost. Cooperation and input from pathologists regarding the presence of intraductal component, tumor size, and other prognostic factors should be useful in selecting those patients who do not require a boost.

#### 3. What is the Role of Adjuvant Therapy for Patients with Node-Negative Breast Cancer?

The panel's recommendation was that since there are many unanswered questions in the adjuvant systemic treatment of node-negative breast cancer, it is imperative that all patients who are candidates for clinical trials be offered the opportunity to participate. Of course, this recommendation begs the question, but is not surprising considering that only two of the thirteen members of the consensus development panel are practicing physicians. The recommendations regarding adjuvant systemic treatment for patients who are not candidates for such trials or who refuse to participate are disappointingly vague and, regrettably, do not incorporate any of the information presented in the answer to the next question.

#### 4. How should Prognostic Factors be Used in the Management of Node-Negative Breast Cancer?

The panel responded to this question by outlining the characteristics of a useful prognostic indicator, which led to the selection of the following prognostic factors:

- Tumor size
- Estrogen and progesterone receptor status
- Nuclear grade
- Histologic type
- Proliferation rate

Other factors, such as a high level of cathepsin-D are associated with an unfavorable prognosis, and data for HER-2/NEU epidermal growth factor receptor and stress-response (heat shock) proteins are of interest, but further investigation is required before reaching any conclusions about their clinical value.

When it came to estimating individual risk and making some specific recommendations based on these prognostic factors, the panel waxed vague once again. The panel clearly seemed to be reluctant to make any definitive recommendations for fear that fewer patients might enroll in clinical trials. What a remarkable pendulum shift from the *NIH Clinical Alert* of May 1988 that urged medical and surgical oncologists to consider strongly either adjuvant hormonal or cytotoxic chemotherapy in all node-negative breast cancer patients under the age of seventy-one. While most medical and surgical oncologists believed that the *Clinical Alert* recommendations were too drastic -- the absence of clear recommendations in this latest consensus statement is disappointing. This lack of recommendations is doubly confusing when one reads the third paragraph of the *NIH Consensus Summary* where it states that several trials have recently shown improvement in disease-free survival for node-negative breast cancer patients who receive adjuvant chemotherapy.

## 5. What are the Directions for Future Research?

In response to this last question, the panel made several recommendations including the refinement of existing prognostic factors in order to identify subgroups of patients who could be treated more specifically, such as with surgical excision without radiation or by omitting axillary node dissection. The panel suggested plans for improvements in chemotherapy regimens, and recommended that studies be done to determine the optimal margins for local excision of a tumor, as well as studies to determine the need for booster irradiation. I fully concur and would encourage readers to obtain a copy of the complete *NIH Consensus Statement*.

*Those of us practicing medicine in the State of Maryland and throughout the nation are grateful to NIH for sponsoring these consensus development conferences that bring together world experts to focus on special problems in clinically important diseases. These conferences certainly need to be continued and I would urge that a greater number of physicians in clinical practice be added to these panels in order to provide a more complete representation of physicians who must deal with these issues.*

## Board of Physician Quality Assurance Actions

In the Matter of  
Josette W. Bianchine MD  
Before the  
Maryland Board of  
Physician Quality Assurance

### Consent Order

On August 27, 1990, the State Board of Physician Quality Assurance (the Board), pursuant to its authority under *Md. Health Occ. Code Ann.*, §14-504, charged Josette W. Bianchine MD (the Respondent), under *Md. Health Occ. Code Ann.* §14-504(a)(1) (1989 Cum. Supp.), in charges Under the Maryland Medical Practice Act.

The pertinent provisions of §14-504 provide:

(a) Subject to the hearing provisions of §14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:

(1) Fraudulently or deceptively obtains or attempts to obtain a license for the applicant or licensee or for another.

On November 7, 1990, a settlement conference was held. Present were John F. Strahan MD, the Board's Settlement Officer; J. Andrew Sumner MD, Board Member; Barbara Hull Foster, Board Counsel; Valerie Shanahan, Assistant Chief Case Manager; Katherine Wellman, Case Manager; Debra G. Woodruff, Assistant Attorney General; Sylvia J. Williams, Paralegal; Respondent; and Stuart D. Gavzy, Esquire, Counsel for Respondent. As a result of negotiations entered into during the settlement conference, Respondent agreed to the following Consent Order.

### Findings of Fact

1. On January 17, 1964, Respondent was licensed to practice medicine in the State of Maryland and remained licensed until September 30, 1986.
2. On January 11, 1982, Respondent pleaded guilty to

seven counts of making, uttering, or selling a false or forged prescription involving a Schedule II controlled drug in *The State of Ohio v Josette W. Bianchine*, Indictment No. 81CR-06-1924, in the Court of Common Pleas, Franklin County, Ohio.

3. On July 14, 1982, the State Medical Board of Ohio (the Ohio Board) suspended Respondent's license to practice medicine in Ohio as a result of Respondent's guilty plea and subsequent conviction as described in paragraph 2 above. The suspension was stayed subject to the following conditions of probation:

1. Respondent is not to prescribe or dispense any drugs, chemicals or substances that are habit-forming;
2. Respondent is to appear in person before the Ohio State Medical Board or its representatives every four months; and
3. Respondent is to comply with all provisions of her court probation.
4. After notification by the Ohio Board, Respondent failed to appear before the Ohio Board on July 14, 1983 and August 11, 1983.
5. On December 4, 1983, the Ohio Board suspended Respondent's license to practice medicine and surgery in Ohio.
6. On or before August 31, 1984, Respondent submitted an application for renewal of her license to practice medicine in Maryland. Respondent answered "no" to the following questions:

Has your license been denied, suspended, or revoked in any state?

Have you been convicted of any violation of law pertaining to your profession?

Respondent's answers were false because:

- a. On December 4, 1983, Respondent's license to practice medicine in Ohio was suspended; and
- b. On January 11, 1982, Respondent pleaded guilty to seven counts of making, uttering, or selling a false or forged prescription involving Schedule II controlled drugs.

Unaware of Respondent's false answers, the Maryland State Board of Medical Examiners renewed Respondent's license to practice medicine in Maryland on or before September 30, 1984.

7. On June 24, 1986, the New York State Board of Professional Medical Conduct (the NY Board) suspended Respondent's license to practice medicine in New York as a result of the disciplinary action taken by the Ohio Board on December 4, 1983. The suspension in New York was stayed subject to conditions of probation for one year.
8. Respondent failed to submit an application for

renewal of her license to practice medicine in Maryland on or before September 30, 1986.

9. On or before October 17, 1986, Respondent submitted an application for reinstatement of her license to practice medicine in Ohio. On December 4, 1987, Respondent and the Ohio Board entered into a Consent Agreement in which the Ohio Board reinstated Respondent's license to practice medicine but prohibited Respondent from prescribing or dispensing addictive drugs.

10. On December 29, 1988, Respondent submitted an application for reinstatement of her license to practice medicine in Maryland. Respondent's answers to certain questions on the application are as follow:

7. Have you ever been charged with violation of any law relative to practice of medicine or relative to any crime (felony)? No.

10. Have you ever been notified by any medical licensing agency or medical society of a complaint against you or of an investigation related to the practice of medicine? Never have I had any complaint related to the practice of medicine.

11. Have you ever had your medical license revoked, suspended or placed on probation or have you surrendered a (local, state, or federal) permit to prescribe controlled substances? Yes, in the State of Ohio, 1981, license was suspended and I was placed on probation for a period of five years. License reinstated in 1988.

11. Respondent's answer to question seven on the application for reinstatement of her Maryland license was false because on May 8, 1981, in the Court of Common Pleas, Franklin County, Ohio, the Grand Jury indicted Respondent and charged Respondent with:

- a. two counts of writing prescriptions for controlled dangerous substances for another person with the purpose that the recipient of the controlled substances would sell or offer to sell the controlled substances; and
- b. seven counts of making, uttering, or selling a false or forged prescription where the drug involved was a Schedule II controlled substance.<sup>1</sup>

12. Respondent's answer to question ten on the application for reinstatement of her Maryland license was false because Respondent was notified to appear at a formal hearing by the Ohio Board on April 28, 1982 after the Ohio Board charged<sup>2</sup> Respondent based on her guilty plea and subsequent conviction of seven counts of "... illegal prescribing of drug documents."

13. Respondent's answer to question ten on the application for reinstatement of her Maryland license was also false because Respondent failed to report that she appeared at a discipli-

nary hearing on January 9, 1986, *In the Matter of the Disciplinary Proceeding against Josette W. Bianchine*, No. 4286, after being charged on October 8, 1985 by the New York State Board for Professional Medical Conduct with having been found guilty of improper professional practice or professional misconduct by the Ohio Board.

14. Respondent's answer to question eleven on the application for reinstatement of her Maryland license was false because Respondent failed to report:
  - a. that she surrendered her Ohio DEA Registration #AB6338657 on February 28, 1983;
  - b. that her license to practice medicine in Ohio was suspended from December 3, 1983 until December 14, 1987; and
  - c. that her license to practice medicine in New York was suspended; that suspension was stayed and she was placed on probation for one year on June 24, 1986.
15. Unaware of Respondent's false answers, the State Board of Physician Quality Assurance issued a license to practice medicine in Maryland to Respondent on April 27, 1989.

### Conclusions of Law

Based upon the Findings of Fact, the Board concludes, as a matter of law, that Respondent fraudulently or deceptively obtained or attempted to obtain a license for the applicant or licensee or for another. (*See Md. Health Occ. Code Ann. §14-504(a)(1)* (1989 Cum. Supp.).)

### Order

Based on the foregoing Findings of Fact, it is this 28th day of January 1991, by an affirmative vote of the majority of the full authorized membership of those members of the Board of Physician Quality Assurance of Maryland who considered this case,

ORDERED that Josette W. Bianchine MD, is hereby formally REPRIMANDED; and it is further

ORDERED that the Board shall grant Respondent a license to practice medicine in Maryland subject to the following probationary conditions:

1. Respondent has signed releases permitting the Board to obtain information about Respondent from any other relevant individuals or organizations as requested by the Board.

2. Respondent must take and pass the Special Purpose Examination (SPEX) with a score of 75.
3. Respondent may not practice medicine in the State of Maryland until such time as the Settlement Committee (the Committee) approves a practice setting in which Respondent receives close supervision. Respondent may not petition the Committee to approve a practice setting until such time as Respondent passes SPEX with a score of 75. Respondent must arrange for the Committee to receive monthly reports on Respondent's progress during supervised practice.
4. After one year of practicing under close supervision, Respondent may petition the Board for permission to practice without supervision; and be it further

ORDERED that Respondent will be responsible for all costs incurred under this Consent Order; and be it further

ORDERED that this Consent Order is considered a public document pursuant to *Md. State Gov't Code Ann. §10-611, et seq* (1990 Cum. Supp.).

ISRAEL H. WEINER MD, Chairperson  
Maryland Board of Physician Quality Assurance

### Consent

By signing this Consent, I hereby accept and agree to be bound by the foregoing Consent Order and its conditions and restrictions, consisting of ten pages.

1. By signing this Consent, I hereby submit to this Order and its conditions.
2. I acknowledge the validity of this Order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this Order.
3. I acknowledge that by consent to this Order, I am waiving my right to challenge in court the legal authority of the Board of Physician Quality Assurance to take action against my license to practice medicine in the State of Maryland.

I, Josette W. Bianchine MD, have read this Consent Order and have carefully reviewed each and every part with my attorney, Christine Bianchine, Esquire. I understand it and voluntarily agree to it.

I sign and consent to this Order after having an opportunity to consult with counsel and with full understanding of the meaning and terms of the Order.

JOSETTE W. BIANCHINE MD

## A Clinical Moment With . . . Diabetes

### A "Touch of Diabetes"

*Doctor, I was told by the medical clinic at work after a blood screening procedure that I have a "touch of diabetes" and should come to see you. I am fifty years old, feel fine and, except for being thirty pounds overweight, I believe that I am in excellent health. Why am I here? My father had diabetes, but he must have had a different kind because he took insulin in his later years and had visual complications and circulatory problems.*

The National Diabetes Data Group has established the following diagnostic criteria for diabetes in nonpregnant adults. (Any one is considered diagnostic of diabetes.)

- A. Presence of the classic symptoms of diabetes and rapid weight loss, together with gross and unequivocal elevation of plasma glucose.
- B. Elevated fasting glucose concentration on more than one occasion.
  - venous plasma  $\geq 140$  mg/dl
  - venous whole blood  $\geq 120$  mg/dl
  - capillary whole blood  $\geq 120$  mg/dlIf the fasting glucose concentration meets these criteria, the oral glucose tolerance test (OGTT) is not required. Indeed, virtually all persons with a fasting plasma glucose (FPG) greater than 140 mg/dl will exhibit an OGTT that meets or exceeds the criteria described in C.
- C. Fasting glucose concentration less than that which is diagnostic of diabetes (B - above), but sustained elevated glucose concentration during the OGTT on more than one occasion. Both the two-hour sample and another sample taken between the

administration of the 75-g glucose dose and two hours later must meet the following criteria:

- venous plasma  $\geq 200$  mg/dl
- venous whole blood  $\geq 180$  mg/dl
- capillary whole blood  $\geq 200$  mg/dl

For a diagnosis of Impaired Glucose Tolerance (IGT) in Nonpregnant Adults, three criteria must be met: the fasting glucose concentration must be below the value that is diagnostic for diabetes; the glucose concentration two hours after a 75-g oral glucose challenge must be between normal and diabetic values; and a value between the one-half hour, one hour, or one-and-one-half hour OGTT value must be unequivocally elevated.

If a patient has laboratory results compatible with a diagnosis of diabetes mellitus, that person does not have a "touch of diabetes" -- s(he) has diabetes. Diabetes education, dietary instruction, and an exercise program should be begun immediately. If a before meal and a bedtime plasma glucose of 120 mg/dl cannot be maintained by that regimen, the use of a sulfonylurea drug or insulin is needed.

The term, "a touch of diabetes," is not an acceptable one. For those patients who demonstrate plasma glucose values above normal on occasion but insufficient to be diagnosed as diabetes mellitus, the term, "Impaired Glucose Tolerance (IGT) in Nonpregnant Adults," is used. Persons having a diagnosis of IGT should be followed regularly for possible deterioration to diabetes.

## Prognostic Factors After Liver Resections

In the United States, most malignant tumors of the liver are metastatic, mainly from colorectal cancer. Primary hepatic malignancies are less common.

### Liver Metastases from Colorectal Cancer

Over 800 patients with liver metastases who were rendered clinically disease-free by resection have been registered in the National Registry of Hepatic Metastases.<sup>1</sup> The male:female ratio was almost equal. The operative mortality (i.e., death within thirty days of liver resection) was about 8 percent. The overall five-year survival was 24 percent. While there was no significant difference in survival between men and women, differences in the five-year survival were noted according to the following factors.

1. Age
 

Forty years of age or younger	40 percent
Forty to seventy years of age	32 percent
Over seventy years of age	30 percent
2. Initial disease-free survival (i.e., the time from bowel resections until there was evidence of liver metastases)
 

One month or less	24 percent
One year	28 percent
Over one year	40 percent

Therefore, longer periods yield better results.

3. The stage of the cancer at the time of colorectal surgery
 

Regional lymph nodes absent	38 percent
Regional lymph nodes present	28 percent
4. Number of metastases in the liver
 

One metastasis	37 percent
Two metastases	24 percent
Three to four metastases	18 percent
More than four metastases	Very poor

Therefore, surgical removal of three, but not more than four, is highly recommended if at all possible.

5. Lobar involvement
 

Multiple metastases in one lobe	28 percent
Multiple metastases in both lobes	19 percent

Data from Erlangen, West Germany showed similar five-year survival at 21 percent.

6. Margins of liver resection
 

Margin of resection positive	18 percent
Margin of resection negative, but less than 1 cm	26 percent
Margin of resection negative, but more than 1 cm	44 percent

Erlangen data indicate zero percent five-year survival in their patients with positive resection margin (i.e., tumor present at the margins of liver resection). They strongly suggest that if the patient cannot be made clinically disease-free at the time of resection, surgery is contraindicated. While some investigators look at these data as they stand, we must keep in mind that positive margins are encountered in patients with a large tumor load.

### 7. Extrahepatic metastases

Of twenty-five patients who had liver metastases and celiac and porta hepatic lymph node metastases that were resected, only one survived for five years. Similarly, of thirty-seven patients who had liver metastases with either lung, peritoneal, or adrenal metastases that were resected, only one survived for five years. Therefore, it seems that debulking of the tumor gave no prognostic advantage except in carcinoid tumors.

### Primary Hepatic Malignancies

One hundred six patients were studied. Their ages ranged from five to eighty-six years of age. There were nine operative and postoperative deaths (8.5 percent). The causes of death were intra-operative hemorrhage, cirrhosis, liver failure secondary to aggressive resections, myocardial infarction, and celiac axis thrombosis. The five-year survival was 31.9 percent. Fibrolamellar hepatocellular carcinomas are rare and they have the best prognosis. On the other hand, cholangiocarcinoma gave poorer results than hepatocellular carcinomas.<sup>2</sup>

Director, Surgical Oncology Program  
University of Maryland

Tumor conferences are held weekly on Tuesday between 8 and 9 am in Room S9A06 at the University of Maryland Medical System. Physicians are welcome to attend this open meeting and to present cases and pathology slides. Call 301-328-5224 by noon Monday to be placed on the schedule: Surgical Oncology Program, University of Maryland Medical System, Room N13E02, Baltimore, MD 21201. ■

## Auxiliary

### Why Belong to the Auxiliary?

We are well aware of the changes facing the medical profession today -- from government regulation, to professional liability, to competition and cost pressures. Amid these changes, the overriding challenge for physicians is to maintain excellence in patient care in the face of complexity and uncertainty.

Within the AMA Auxiliary, we have what is needed to help assure quality health care; it is our ability to work together to reach common goals. The key to working together is our federation of national, state, and county auxiliaries.

The AMA Auxiliary federation is the organization to speak for our concerns, to help find viable solutions to the problems of today, and to address changing needs and demands. Our federation gives us the *cooperative action, unity, and strength* that will help realize our potential to respond positively to change.

The importance of cooperative action cannot be overemphasized. For those of us in the Auxiliary, that's the name of the game. The AMA Auxiliary's strength lies in a federated structure in which each level of the organization -- county, state, and national -- works together to enhance activity and reach common goals.

*Cooperative action* is the foundation of our programming as we share ideas through our national network. It is what has enabled us to have an impact on such problems as child abuse, teenage suicide, and drunk driving; to encourage prenatal and postnatal care; and to enhance auxiliary involvement in community services for the growing numbers of older Americans. It is what is helping us to work with the AMA in its initiative to protect the health of our nation's youth.

Cooperative action enables us to do the right things, at the right time, in the right way, and for the right reasons.

Cooperative action is also what enables us to work with our medical associations to add to the effectiveness of our programs. Across the country, auxiliaries have joined medical societies to influence legislation through our nationwide phone bank system and our other legislative contact systems, to support health programs, and to provide needed funds for medical education. By building upon the energies and the strengths of both groups, we are able to have a greater effect on the issues of today.

The cooperative action that is within our federation will give us the strength we need to make a positive impact on the concerns of these times. But *unity* is also important because our federation is built on diversity. Auxiliary members in every city, county, and state have special, personal interpretations of the meaning of our common goals. And, that's the way it should be, because we are a diverse group -- geographically, socially, economically, and politically.

But while this diversity gives us flexibility and choice, it also brings a need to uphold and work for strong values and goals. For these values and goals are the common thread -- the unity -- that binds us together, so that despite our diversity, we are able to use our federated structure to invest ourselves in community programs that will improve the lives of others. Unity also gives us the ability to provide support for physicians' spouses in the stresses that result from medicine's changing environment.

### On the Leading Edge

The Southern Medical Association (SMA) and Auxiliary (SMAA) recently announced plans for the 85th Annual Scientific Assembly, "On the Leading Edge." Included in the program are twenty-four specialty section meetings with over 500 scientific papers, 340 exhibits, twenty-six scientific and clinical symposia, twenty-three postgraduate courses, and twenty-four round table luncheon sessions.

The opening ceremony's speaker will be General Paul X. Kel-

ley, Commandant of the Marine Corps and Member of the Joint Chiefs of Staff. Doctors' Day luncheon speaker will be the well-known Paul Harvey. The President's Dinner Dance will feature pianist Peter Nero and vocalist Shirley Jones, accompanied by the Atlanta Pops Orchestra.

The SMA Auxiliary will hold its General Session/Business Meeting on November 17, at which time our Maryland representatives, Vice Councilor Josie Figueroa and Councilor Ching Barretto, will be

introduced. At the Auxiliary Luncheon, new officers will be installed, including Maryland Auxilian, Mildred Taylor, as Treasurer.

Plan to join the Southern Medical Association Auxiliary November 16-19, 1991 for the convention in Atlanta, Georgia -- an exciting metropolis which combines the charm of the past with the energy of the present and the dreams of the future.

For additional information, call 1-800-423-4992.

Our unity is what keeps our programs on target in these changing times. For while diversity is the spice of our membership, the unified values and common goals we share as a federation are its lifeblood. They are what will enable us to reach our potential and make a difference in the world around us.

Finally, let's talk about *strength*. A federation implies strength, but our federation will be strong only as long as we continue to work together to reach our common goals. So often we take things for granted. We need to remember how this federation came about. This organization didn't start at the top with a national level as an arbitrary structure. It was started by groups of physicians' spouses like those of us in Maryland. These physicians' spouses first got together in their own communities to share concerns and goals. Then these groups formed county organizations, then the county organizations formed state organizations, and then the state organizations formed the national organization. This federation of county, state, and national organizations became a reality because it was needed. Each level still serves a different and vital purpose. Together, they make us strong.

Our county auxiliaries are where the action is. Our state auxiliaries are where the action is coordinated. Our national auxiliary is where the action comes together. We need to remember that we are not

separate from each other. Each time AMA Auxiliary leaders represent you, each time a publication such as *Facets* informs you of an issue or the status of a current issue, each time a grassroots phone bank is initiated and proves successful, each time a program is shared through the project bank, each time you attend a leadership confluence or use the professional skills development service or watch one of the new videos or use the programs workbooks, you are seeing the federation at work -- a federation whose *cooperative action, unity, and strength* are needed by every physician's spouse today.

William Jennings Bryan once wrote "Destiny is not a matter of chance. It is a matter of choice. It is not a thing to be waited for. It is a thing to be achieved."

If ever our spouses needed our support, it is now. If ever our communities needed our health advocacy, it is now. If ever the medical family needed our encouragement, it is now. Our destiny is to use the potential we have to help the medical profession, to promote good health, and to help the medical family meet the challenge of change.

Together we are stronger. Together we can do more. Together we will make a difference.

(Adapted from material provided by the AMA Auxiliary.) ■

## YOUR WILL: a powerful way to help others.

Think about it. Remembering a worthwhile charity in your will is a *powerful* way to assure that the principles you believe in are supported and that your hard work will help others in the future.

## Maryland Medical Journal Mission Statement

The purpose of the *Maryland Medical Journal (MMJ)* is to educate and inform its readers of progress in clinical medicine and medical research and of development in other fields of interest to physicians; to promote the science and art of medicine toward the betterment of public health; and to provide a literate forum for open and responsible discussion of matters relevant to the field of medicine.

# COMING OUT OF THE DARK

Med Chi's Physician Rehabilitation Committee deals with the substance abuse and mental health problems of Maryland physicians, with a confidential and nondisciplinary focus...Addiction, Marital/Family Conflicts, Psychiatric Illness, Organic Impairment, Physical Handicap...If these problems exist, we can help find the solution. Call us.

The Physician Rehabilitation Committee of Med Chi is available to all Maryland physicians, and their families.

The Committee is NONDISCIPLINARY and information is kept CONFIDENTIAL. If you, a colleague, or family member is in need of our services call (301)962-5580 or call toll free (800)992-7010, or leave a message 24 hours a day, 7 days a week at (301)727-1020.

*HELPING IS OUR BUSINESS...All donations to the Physician Rehabilitation Committee are used for the delivery of services to Maryland physicians in need of help. If you wish to help further the work of the Committee through a tax deductible donation send your check to: The Medical and Chirurgical Faculty Charitable/Educational Foundation, 1204 Maryland Avenue, Baltimore, Maryland 21201 Please note on your donation: "Physician Rehab"*

*John L. Cameron MD*, Professor and Chairman for the Department of Surgery and Surgeon-in-Chief at The Johns Hopkins Hospital, was recently elected president of the Society for Surgery of the Alimentary Tract (SSAT) during Digestive Disease Week. The SSAT, founded in 1960, provides a

forum for 1,100 surgeons interested in the latest diagnosis, treatment, and management of problems of the digestive tract. The author of over 200 articles, sixty-three book chapters, and four books, Dr. Cameron received his BA from Harvard University and his MD from The Johns Hopkins University School of Medicine. An active member of numerous societies, Dr. Cameron is currently President-elect, Society for Surgery of the Alimentary Tract; Director, American Board of Surgery; and Vice President, Society of Clinical Surgery.

The Maryland Radiological Society recently elected *Lawrence E. Holder MD, FACR* as President. A graduate of Vanderbilt University (magna cum laude) and Washington University School of Medicine in St. Louis, Missouri, Dr. Holder is currently Director of Nuclear Medicine at Union Memorial Hospital, Chief of Radiology at Children's Hospital,

Chief of Radiology at Cardinal Shehan Center for the Aging at Stella Maris Hospice, and a Radiologist with Drs. Schultze, Snider & Associates PA. An Assistant Professor in Radiology at The Johns Hopkins University School of Medicine, he has also taught at the University of Cincinnati College of Medicine and the Washington University School of Medicine. A Fellow in the American College of Radiology, Dr. Holder has over forty publications to his credit and has made over twenty presentations to state and national specialty societies. Dr. Holder is married and has three children.

On August 1, 1991, *Theodore M. King MD, PhD* became President of Family Health International (FHI), a nonprofit North Carolina organization engaged in research and technical assistance on contraceptive development, reproductive health, family planning, and AIDS prevention. Dr. King,

internationally recognized for his work in women's reproductive health, has been an Associate Professor at the University of Missouri School of Medicine, a Professor and Chairman of the Department of Obstetrics and Gynecology at Albany Medical College and, most recently, Professor and Director of the Department of Gynecology and Obstetrics at The Johns Hopkins University School of Medicine, and President of the Johns Hopkins Program for International Education in Gynecology and Obstetrics. Author of over seventy-five manuscripts, Dr. King graduated from Quincy College in Illinois with a BS in biology and chemistry and went on to receive a Masters degree in zoology from the University of Illinois, a PhD in physiology from Michigan State University, and an MD from the University of Illinois School of Medicine. Winner of numerous awards, he is a Fellow in the American College of Surgery and a Fellow in the American College of Obstetricians and Gynecologists.

*Harry C. Knipp MD*, a Diplomate of the American Board of Radiology, was recently elected Treasurer of the Maryland Radiological Society. A graduate of Loyola College and the University of Maryland School of Medicine, Dr. Knipp is extremely active in community activities. Married, with three children, he is a partner in Carroll Imaging Associates PA; is on both

the staff of the Department of Diagnostic Radiology, Ultrasound, and Nuclear Medicine at Carroll County General Hospital and the Johns Hopkins Health Plan;

## MEMBERS IN THE NEWS MEMBERS

is an adjunct Assistant Professor in the Department of Diagnostic Radiology of the University of Maryland School of Medicine; and is a Consultant Radiologist with Springfield Hospital Center.

*Patrick C. Walsh MD, Urologist-in-Chief at The James Buchanan Brady Urological Institute of The Johns Hopkins Hospital, was recently awarded the 1991 Distinguished Alumnus Award by the Medical Alumni Association of Case Western Reserve University. A member of the Editorial Board of four medical*

*journals, Dr. Walsh was recognized for "outstanding service by an alumnus whose work has made a significant mark in the field of medicine and whose efforts have brought distinction for the Case Western Reserve University School of Medicine." A prolific author, he has served as a consultant to numerous local hospitals, as well as to federal government organizations. Dr. Walsh has earned many academic honors for research, patient care, and writing.* ■

### *Physician's Practice Digest*

*During the past year, in an effort to improve communications and widen the scope of member services, Med Chi developed a new publication, Physician's Practice Digest. Issued quarterly, PPD features information related to medical practice management. The reaction to PPD has been overwhelmingly positive within Maryland as well as around the country. The publication won the 1990 Sandoz Pharmaceutical Award for Excellence in Medical Journalism.*

*Med Chi looks forward to Physician's Practice Digest becoming a reliable and up-to-date source of crucial practice management information for all physicians in Maryland. Submissions and suggestions are always welcome!*

## AUTHOR INFORMATION AUTHOR

Manuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

### Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a WordPerfect or ASCII format.

Include full name of author(s) with highest degrees and academic or professional titles.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

An introductory synopsis of approximately 25 to 50 words is required.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the *Uniform Requirements for Manuscripts Submitted to Biomedical Journals* compiled by the International Committee on Medical Journal Editors (available through the *Annals of Internal Medicine*).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the principal author and *MMJ*.

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset. ■

## Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

### Saturday Evening Consultation

A live program  
Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.  
Broadcast across the country  
An hour-long program  
Call-in format: Physician answers questions from listeners

### Sunday Morning Consultation

A pre-taped program  
Sunday at 7:30 a.m.  
Broadcast on WBAL - AM radio  
A half-hour program  
Interview format: one-on-one talk with John Stupak

Med Chi encourages all physicians to appear on these innovative programs. To register fill in the form below.  
Yes, I am interested in speaking on Consultation. Please contact me with scheduling information.

### FAMILY PRACTICE

Two female family practice physicians desire a third to join them in active and growing Pasadena, MD practice. Must be Board Certified. Call 255-2700 for further information. Ask for Carla Varnum.

### PART-TIME EMERGENCY MEDICINE

Baltimore/Washington Area. Part-time positions available in highly desirable, moderate volume Emergency Department (28,500 patients in 1990) at Howard County General Hospital. Hospital is located in an attractive community situated between Baltimore and Washington DC in Columbia, MD. Applicants should be board certified/prepared in emergency medicine or related specialty. Send CV to Paul Emergency Physicians Group, Sam Shoemaker Bldg, Ste 201, 11065 Little Patuxent Parkway, Columbia, MD 21044. 301-997-1414 or 301-467-3886.

### OPHTHALMOLOGIST

Wanted for Ellicott City office. Equipment provided, flexible terms. Reply to Box 9.

### PHYSICIANS WANTED

Semi-retired or retired physicians for pleasant office practice part-time. Call 547-2686.

### PEDIATRICIAN

Pediatric Group, Baltimore suburb, desires pediatrician for employment, leading to full partnership. Send resume to Box 9, 9121 Reistertown Road, Owings Mills, MD 21117.

### IM/FP PHYSICIAN

Husband/wife Internal Medicine General Practice seeking BC/BE, Internal Medicine or Family Practice Physician who desires part-time practice. Ideal for physician raising a family. Ability to cover Crofton office full-time 3 to 4 weeks a year and willingness to cover hospital practice desired. Contact Joan McHugh, Office Manager, 301-721-7900.

### GENERAL INTERNIST

The Department of Medicine at Franklin Square Hospital Center has been awarded a Public Health Service grant for residency training in General Internal Medicine. The grant award included approximately 50% support for a general internist with a strong background in primary care education. The Department is currently seeking applicants for this position. The physician recruited for this half-time position will work primarily in conjunction with the Director of Ambulatory Medicine in expanding the existent continuing training on-site at Franklin Square, as well as incorporation of selected community sites. This physician will be significantly involved in the development of a formal behavioral science curriculum to include psychosocial issues, interviewing skills, addiction training, and cross-cultural medicine (religious beliefs, concepts of disease and health, attitudes toward death and dying). Work in this area will be under the direction of the Director of Behavioral Science Training (currently being recruited) along with the full-time general internists on staff. Applicants for this position must be Board Certified in Internal Medicine. A fellowship in General Internal Medicine is desirable but not necessary. In addition to half-time support provided by the grant award, possibilities do exist to augment revenue by performing additional services for the hospital and the residency program or by development of a private practice. Inquiries should be accompanied by a CV and forwarded to: Daniel C. Hardesty MD, Chairman, Dept of Medicine, Franklin Square Hospital Center, Baltimore, MD 21237.

### SPECIALISTS WANTED

Orthopedic Surgeon, Pediatrician, Psychiatrist, Ophthalmologist. Please call: 859-0355.

### BEHAVIORAL SCIENTIST

The Department of Medicine at Franklin Square Hospital Center has been awarded a Public Health Service Grant for residency training in General Internal Medicine. The grant award includes approximately 50% support for a behavioral scientist with special interest in Behavioral Medicine, educational methods, and ethics. The Department is currently seeking applicants for this position. The behavioral scientist recruited for this position will work primarily in conjunction with residents and general internists in the Department. An expanded behavioral science curriculum will be developed including psychosocial issues, cross-cultural medicine, interviewing skills, addictions training, and intervention skills. Applicants for this position must have some experience in educational methodology to include curricular design and evaluation and feedback systems. It is desirable that candidates for this position be at a doctoral level. In addition to half-time support provided by the grant award, possibilities do exist to augment revenue by performing additional services for the hospital. Inquiries should be accompanied by a CV and forwarded to: Daniel C. Hardesty MD, Chairman, Dept of Medicine, Franklin Square Center, 9000 Franklin Square Dr, Baltimore, MD 21237.

# Why buy an office automation system that doesn't offer a long-term solution?

## ACCLAIM™ from Sentient is the total system solution.

A lot of medical practices are planning to invest in an office automation system. But a lot of the systems out there just don't offer the comprehensive functions and long-term expandability that your practice may need.

### **IBM® and compatible hardware.**

The ACCLAIM system operates on IBM and compatible hardware, so you know you're getting the quality standard of the industry. And it's completely expandable, so it can grow as your practice grows.

### **Long-term support.**

ACCLAIM is the system solution that fits your needs today. And Sentient's software engineers, customer trainers, and telephone support people

are always there to make sure your system fits your needs over the years to come.

### **Easy to operate.**

Even if your staff has no previous computer experience, ACCLAIM is simple to operate effectively and efficiently. Complete training is included in the purchase.

When you're thinking about office automation, call Sentient first, and find out what ACCLAIM can do for you.

# Our Members Are Not Dying For A Free Tail.

Strangely enough, some companies are trying to sell Maryland physicians a professional liability policy that requires them to die or become permanently disabled in order to get a free tail. At Medical Mutual, our members can get a free tail while they are very much alive.

We make the tail available at no extra cost for those of you who are planning to retire from the practice of medicine after five consecutive years on our claims made and/or occurrence policy. If retirement is not in your plans, our tail is free at any age after 15 consecutive years on our claims made policy. As an added feature, you may step down from a higher rated specialty to a lower rated one with no tail charge for making the change.

Your broker or our Member Services Representatives can answer your questions about tail provisions for Medical Mutual members.

Of course, we also give a free tail in the event of your permanent disability or death.

We just don't think this should be your only choice.

# Central Laboratories

Established 1970

## *Partners for Quality Healthcare*

### **First in Quality:**

Central Laboratories is dedicated to providing outstanding service. Clients, our ultimate focus, motivate us to provide unmatched quality, reliability, consistency, and value. Our unique commitment is reflected in the exceptional level of technical proficiency, client support, and service we provide to all our customers. Quality assurance begins the minute the specimen is collected and continues throughout testing and reporting.

### **Continuous in Service:**

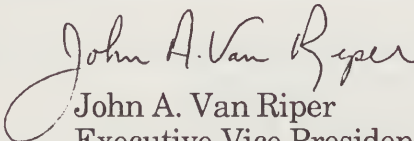

Our dedication to outstanding service compels us to provide for your individual needs. In doing so, we have expanded our operations to include **full service laboratory testing for Washington, D.C. and Suburban Maryland through our conveniently located Montgomery County Laboratory.** When it comes to **personalized laboratory testing services**, no one performs like Central Laboratories.

### **Continuous in Value:**

Our commitment to the highest quality laboratory services attainable is founded in our long tradition of service to the community. *Our innovative and progressive convictions differentiate us from our competitors and can provide for your laboratory needs today...and tomorrow.*

# Maryland's newest physical rehab center already has 20 years experience.

Baltimore is a city known internationally for its outstanding medical care. Now the tradition continues with the addition of the new Maryland General-Bryn Mawr Rehab Center at Maryland General Hospital. This specialty center for physical medicine and rehabilitation offers Bryn Mawr Rehab's 20 years of experience and leadership in the field of rehabilitation medicine.

The partnership between Maryland General Hospital and Bryn Mawr Rehab is truly unique. For the first time in Maryland, two high quality institutions with long histories of health care achievement are coming together to make a major commitment to rehabilitation medicine.

The Maryland General-Bryn Mawr Rehab Center, the region's most modern and conveniently located rehabilitation facility, provides a continuum of care in physical and cognitive rehabilitation services

including brain injury, stroke, orthopedics, arthritis, amputee services and multiple sclerosis, among others.

Most importantly, everyone on the Maryland General-Bryn Mawr Rehab team is personally and professionally dedicated to helping patients reach their highest level of independence. Our guiding philosophy is team-centered care, focused upon the individual needs of our patients and their families. This is what makes Maryland General-Bryn Mawr Rehab Center a very special place for rehabilitation care.

To learn more about Maryland General-Bryn Mawr Rehab Center or to arrange a tour, please call Mary Filippelli our administrative director at (301) 225-8380.

Maryland General-Bryn Mawr Rehab Center. We're the new team in town with lots of experience.

# DIFFICULT DECISIONS

## An Older Person Exhibits The Following Psychopathology:

1. Depression, Bizarre Behavior, Schizophrenia
2. Severe Anxiety, Mania, Functional or Organic Psychoses
3. Impulsivity, Eating Disorders, Severe Obsessions/Compulsions
4. Addictions in Conjunction with Other Psychiatric Disorders

## What Is An Effective Therapeutic Response?

### The Geropsychiatric Program At Taylor Manor Hospital

In response to the growing population of older persons who suffer from a treatable mental illness, Taylor Manor Hospital announces the expansion of our Geropsychiatric Program. Now, older patients who may have reversible dementia, affective disorder, depressive illness and addictions accompanied by psychiatric symptoms, will benefit from the comprehensive assessment and treatment provided by our multi-disciplinary team of geriatric specialists.

Admission criteria to the Geropsychiatric Program are as follows: patients must be age 65 or older (unless suffering from premature pathological aging), must exhibit moderate to severe emotional, behavioral, intellectual, or neurological impairment, or pose a danger to themselves and/or others. Length of stay depends upon the nature of the illness and responsiveness to treatment.

Each patient receives highly individualized attention through individual and group therapy, as well as educational groups and an array of multi-modal programs addressing specific problems. The referring professional is closely consulted at every stage of therapy -- including the initial consultation and our in-depth diagnostic evaluation -- to ensure that the individual is placed in the most appropriate treatment setting. Taylor Manor Hospital also provides specialized medical attention, if needed, through agreements with local hospitals, following consultation with the referral source.

Aftercare treatment is coordinated by a staff social worker, in close cooperation with the referring professional. Because of the importance we place on effective continuity of care, our affiliated network of conveniently located outpatient treatment centers (Taylor Mental Health Services), is available to patients after discharge at the discretion of the referring professional. Our common goal is to restore seniors to their maximum emotional well-being, by providing personal support and practical help in an atmosphere of consideration, respect, and caring.

# If There is Alzheimer's Disease...

**Church Home** has been caring for men and women with Alzheimer's Disease since 1987 in a small and very special place we call the Broadway Wing.

The Wing is physically separate from Church Home but, like the Home, directly connected to Church Hospital. It is restful and secure. There are 22 private rooms and an enclosed garden. Nowhere in the Baltimore area is there a nursing staff better prepared—by training, experience, and temperament—for their profession.

One monthly charge covers virtually everything. There will be no hospital bills, no doctors' bills, no bills for medicines. And there is no entrance fee.

For more information or to arrange a visit to the Broadway Wing, call 732-1410.

## With Malpractice Insurance Premiums on the rise, why settle for anything less than the best available coverage?

The downward trend in malpractice insurance premiums has broken and prices are on their way back up. Should a physician choose between insurers only on price? Of course not. But there are a number of quality choices between carriers and products. You should get the most from your premium dollars.

Let us compare the available products and prices for you. There is no charge or obligation. For written quotations and comparisons call us or send us a copy of your malpractice policy. Let us show you why hundreds of Maryland physicians rely on us for their malpractice coverage. You need a broker you can rely on.

# EPIDEMIOLOGY & DISEASE CONTROL PROGRAM

201 W. Preston Street, Baltimore, Maryland 21201 (301)225-6700

November, 1991

## Prevention and Control of Influenza

### Influenza in Maryland 1990 - 1991

During the past influenza season (Nov 1990 - Apr 1991) 42 influenza isolates were reported in Maryland. The majority were reported by the Department of Health and Mental Hygiene laboratory. Fourteen (33%) were identified as influenza A and 28 (67%) as influenza B. Three influenza A isolates were A/Beijing(H3N2), not a component of the 1990-1991 vaccine. Nineteen isolates were characterized as B/Yamagata/16/88-like, a component of the 1990-1991 vaccine. During the first part of the influenza season, Maryland isolates were almost exclusively influenza B, and therefore amantadine was not recommended. Influenza A predominated in Maryland in March and April. This pattern of influenza B followed by the later appearance of influenza A was seen in many areas of the country.

A total of 38 outbreaks of upper respiratory illness was reported during the influenza season. Many of these could be characterized as influenza-like illness, that is, patients were reported to have both cough and fever exceeding 100°F. Influenza B was identified as the agent in 8 outbreaks and influenza A in one. All 8 influenza B outbreaks occurred in nursing homes.

The 1990-1991 influenza season in Maryland contrasted with the previous (1989-1990) season where only influenza A was isolated, and outbreaks peaked early in the season. During the 1988-1989 influenza season, viral types were more evenly mixed (41% A, 59% B) and outbreaks peaked late in the season.

Two measures available in the U.S. that can reduce the impact of influenza are immunoprophylaxis with inactivated (killed-virus) vaccine and chemo-

prophylaxis or therapy with an influenza-specific antiviral drug (e.g., amantadine). Vaccination of high-risk persons each year before the influenza season is currently the most effective measure for reducing the impact of influenza. Annual vaccination using the current vaccine is necessary because the immunity for an individual declines in the years following vaccination. In addition, because the 1991-1992 vaccine differs from the 1990-1991 vaccine, only the 1991-1992 vaccine should be used to provide protection for the upcoming influenza season.

### ACIP RECOMMENDATIONS

*The following Immunization Practices Advisory Committee (ACIP) recommendations have been condensed from the CDC. MMWR 1991; 40(RR-6):1-15. They include information on the vaccine and antiviral agents available for controlling influenza during the 1991-1992 influenza season (superseding both the MMWR 1990; 39 (no. RR-7):1-15 and the clarification, MMWR 1990; 39:469). The primary changes include statements about the influenza strains in the trivalent vaccine for 1991-1992.*

**TABLE 1. Influenza vaccine\* dosage, by patient age — United States, 1991-92 season**

Age group	Product†	Dosage	No. doses	Route‡
6-35 mos.	Split virus only	0.25 mL	1 or 2¶	IM
3-8 yrs.	Split virus only	0.50 mL	1 or 2¶	IM
9-12 yrs.	Split virus only	0.50 mL	1	IM
≥12 yrs.	Whole or split virus	0.50 mL	1	IM

\*Contains 15µg each of A/Taiwan/1/86-like (H1N1), A/Beijing/353/89 (H3N2), and B/Panama/45/90-like hemagglutinin antigens in each 0.5 mL. Manufacturers include: Connaught Laboratories, Inc. (distributed by E.R. Squibb & Sons, Inc.) (Fluzone® whole or split); Evans Medical Ltd.-Lederle Laboratories (distributed by Lederle Laboratories) (Flu-Imune® purified surface antigen vaccine); Parke-Davis (Fluogen® split); and Wyeth-Ayerst Laboratories (Influenza Virus Vaccine, Trivalent® split). For further product information call Connaught, (800) 822-2463; Lederle, (800) 522-3753; Parke-Davis, (800) 233-0432; Wyeth-Ayerst, (800) 950-5099.

†Because of the lower potential for causing febrile reactions, only split-virus vaccines should be used for children. They may be labeled as "split," "subviroin," or "purified-surface-antigen" vaccine. Immunogenicity and side effects of split- and whole-virus vaccines are similar for adults when vaccines are used at the recommended dosage.

‡The recommended site of vaccination is the deltoid muscle for adults and older children. The preferred site for infants and young children is the anterolateral aspect of the thigh.

¶Two doses are recommended for children <9 years of age who are receiving influenza vaccine for the first time.

## I. RECOMMENDATIONS FOR USE OF INFLUENZA VACCINE

The trivalent influenza vaccine prepared for the 1991-1992 season will include A/Taiwan/1/86-like (H1N1), A/Beijing/353/89-like (H3N2), and B/Panama/45/90-like hemagglutinin antigens. Recommended doses are listed in Table 1.

Two doses may be required for a satisfactory antibody response among previously unvaccinated children <9 years of age; however, studies with vaccines similar to those in current use have shown little or no improvement in antibody responses when a second dose is given to adults during the same season.

During the past decade, data on influenza immunogenicity and side effects have been obtained when vaccine has been administered intramuscularly. Because there has been no adequate evaluation of recent influenza vaccines administered by other routes, the intramuscular route is the one recommended for use. Adults and older children should be vaccinated in the deltoid muscle, and infants and young children in the anterolateral aspect of the thigh.

### Target Groups for Special Vaccination Programs

To maximize protection of high-risk persons, they and their close contacts should be targeted for organized vaccination programs.

#### Groups at Increased Risk for Influenza-Related Complications

1. Persons  $\geq$  65 years of age.
2. Residents of nursing homes and other chronic-care facilities housing persons of any age with chronic medical conditions.
3. Adults and children with chronic disorders of the pulmonary or cardiovascular systems, including children with asthma.
4. Adults and children who have required regular medical follow-up or hospitalization during the preceding year because of chronic metabolic diseases (including diabetes mellitus), renal dysfunction, hemoglobinopathies, or immunosuppression (including immunosuppression caused by medications).
5. Children and teenagers (6 months-18 years of age) who are receiving long-term aspirin therapy, and therefore may be at risk of developing Reye syndrome after influenza.

#### Groups That Can Transmit Influenza to High-Risk Persons

1. Physicians, nurses, and other personnel in both hospital and out patient-care settings who have contact with high-risk persons among all age groups, including infants.

2. Employees of nursing homes and chronic-care facilities who have contact with patients or residents.

3. Providers of home care to high-risk persons (e.g., visiting nurses, volunteer workers).

4. Household members (including children) of high-risk persons.

### Persons Who Should Not Be Vaccinated

Inactivated influenza vaccine should not be given to persons known to have anaphylactic hypersensitivity to eggs.

Persons with acute febrile illnesses usually should not be vaccinated until their symptoms have abated.

### Simultaneous Administration of Other Vaccines, Including Childhood Vaccines

The target groups for influenza and pneumococcal vaccination overlap considerably. Both vaccines can be given at the same time at different sites without increasing side effects. However, influenza vaccine must be given each year; with few exceptions, pneumococcal vaccine should be given only once.

Children at high risk for influenza-related complications may receive influenza vaccine at the same time as measles-mumps-rubella, *Haemophilus b*, pneumococcal, and oral polio vaccines. Vaccines should be given at different sites. Influenza vaccine should not be given within 3 days of vaccination with pertussis vaccine.

## II. RECOMMENDATIONS FOR THE USE OF AMANTADINE

Amantadine hydrochloride interferes with the replication cycle of type A (but not type B) influenza viruses, although the specific mechanisms of its antiviral activity are not completely understood. When given prophylactically to healthy young adults or children in advance of and throughout the epidemic period, amantadine is approximately 70-90% effective in preventing illnesses caused by naturally occurring strains of type A influenza viruses. When administered to otherwise healthy young adults and children for symptomatic treatment within 48 hours after the onset of influenza illness, amantadine has been shown to reduce the duration of fever and other systemic symptoms and may permit a more rapid return to routine daily activities. Since antiviral agents taken prophylactically may prevent illness but not subclinical infection, some persons who take these drugs may still develop immune responses that will protect them when exposed to antigenically related viruses in later years.

As with all drugs, side effects may occur among a small proportion of persons. Such symptoms are rarely severe, but may be important for some categories of patients.

**Amantadine is recommended for the following:**

## Outbreak Control in Institutions

When amantadine is used for outbreak control, it should be administered to all residents of the affected institution regardless of whether they received influenza vaccine the previous fall. Chemoprophylaxis should also be offered to unvaccinated staff who provide care to high-risk persons.

### Use as Prophylaxis

- High-risk individuals vaccinated after influenza A activity has begun
- Persons providing care to high-risk persons
- Immunodeficient persons
- Persons for whom influenza vaccine is contraindicated

- Others who wish to avoid influenza A illness.

### Use as Therapy

Although amantadine can reduce the severity and shorten the duration of influenza A illness among healthy adults, there are no data on the efficacy of amantadine therapy in preventing complications of influenza A among high-risk persons. Therefore, no specific recommendations can be made regarding the therapeutic use of amantadine for these patients. This does not preclude physicians from using amantadine for high-risk patients who develop illness compatible with influenza during a period of known or suspected influenza A activity in the community. Whether amantadine is effective when treatment begins beyond the first 48 hours of illness is not known.

## IMPORTANT INFORMATION ABOUT INFLUENZA AND INFLUENZA VACCINE, (1991-1992)

*Please read this carefully*

Influenza  
7/1/91

### WHAT IS INFLUENZA ("FLU")?

Influenza (or "flu") is a viral infection of the nose, throat, bronchial tubes, and lungs that can make someone of any age ill. Usually the flu occurs in the United States from about November to April. If you get the flu, you usually have fever, chills, cough, and soreness and aching in your back, arms, and legs. Although most people are ill for only a few days, some persons have a much more serious illness and may need to go to the hospital. On average, thousands of people die each year in the United States from the flu or related complications.

### WHO SHOULD GET INFLUENZA VACCINE?

Because influenza is usually not life threatening in healthy individuals and most people recover fully, health officials emphasize the use of vaccine for the elderly and people with other health problems which make these individuals more likely to be seriously ill or to die from the flu or its complications. For example, people who after even light exercise become short of breath due to diseases affecting their heart or lungs, and people who have low resistance to infections, are likely to be more seriously affected by the flu. Thus, the following groups are at increased risk for serious illness with the flu and should receive vaccine:

- Healthy people 65 years of age and older.
- Adults and children with long-term heart or lung problems which caused them to see a doctor regularly, or to be admitted to a hospital for care during the past year.
- Residents of nursing homes, and other institutions housing patients of any age who have serious long-term health problems.
- People of any age who during the past year have regularly seen a doctor or have been admitted to a hospital for treatment for kidney

disease, cystic fibrosis, chronic metabolic diseases such as diabetes, anemia ("low blood"), or severe asthma.

- People who have a type of cancer or immunological disorder (or use certain types of medicines) that lowers the body's normal resistance to infections. (Because influenza might cause serious illness and complications in persons infected with the AIDS virus, these individuals should receive influenza vaccine.)
- Children and teenagers (6 months through 18 years of age) on long-term treatment with aspirin who, if they catch the flu, may be at risk of getting Reye's syndrome (a childhood disease that causes coma, liver damage, and death).

Medical staff who provide care to high-risk patients in health-care facilities should be vaccinated, to reduce the possibility that these patients might catch the flu when receiving medical care. Family members or others who provide care to high-risk persons at home should also be vaccinated. The possibility for spreading the flu to high-risk persons can be reduced by vaccinating:

- Doctors, nurses, and others in both hospital and outpatient-care settings who have contact with high-risk patients in all age groups, including children.
- Personnel of nursing homes and chronic-care facilities who have contact with patients or residents.
- Individuals who provide care to high-risk persons at home, such as visiting nurses and volunteers, as well as all household members, including children, whether or not they are providers of care.

In addition, a flu shot may be given to:

- Persons wishing to reduce their chances of catching the flu.
- Persons who provide essential community services.

*(PLEASE READ OTHER SIDE)*

- Students or other persons in schools and colleges if outbreaks would cause major disruptions of school activities.
- Persons traveling to the tropics at any time of the year or to countries south of the equator during April - September. (Persons with high-risk medical conditions and those ages 65 and older who are traveling as indicated above especially should be encouraged to receive vaccine.)

**INFLUENZA VACCINE:**

The viruses that cause flu frequently change, so people who have been infected or given a flu shot in previous years may become infected with a new strain. Because of this, and because any immunity produced by the flu shot will possibly decrease in the year after vaccination, persons in the high-risk groups listed above should be vaccinated every year. This year's flu shot contains the strains A/Taiwan/1/86-like, A/Beijing/353/89-like, and B/Panama/45/90-like to provide immunity against the types of flu which have been circulating in the past year, and/or thought to be most likely to occur in the United States next winter. All the viruses in the vaccine are killed so that they cannot infect anyone. Vaccine will begin to provide its protective effect after about one or two weeks, and immunity may decrease, on average, after several months. Flu shots will not protect all persons who get them against the flu. They also will not protect against other illnesses that resemble the flu.

**DOSAGE:**

Only a single flu shot is needed each season for persons 9 years of age and older, but children less than 9 years of age may need a second shot after about a month. The doctor or nurse giving the flu shot will discuss this with parents or guardians. Children less than 13 years old should be given only vaccine that has been chemically treated during manufacture (split virus) to reduce chances of any side effects. Split-virus vaccines can also be used by adults.

**POSSIBLE SIDE EFFECTS FROM THE VACCINE:**

Most people have no side effects from recent influenza vaccines. Flu shots are given by injection, usually into a muscle of the upper arm.

This may cause soreness for a day or two at the injection site and occasionally may also cause a fever or achiness for one or two days. Unlike 1976 swine flu vaccine, recent flu shots have not been clearly linked to the paralytic illness Guillain-Barré syndrome. As is the case with most drugs or vaccines, there is a possibility that allergic or more serious reactions, or even death, could occur with the flu shot.

**SIMULTANEOUS USE OF OTHER VACCINES:**

The target groups for influenza and pneumococcal vaccination overlap. Both vaccines can be given at the same time at different sites without increasing side effects. High-risk children may also receive influenza vaccine at the same time as measles, mumps, rubella, *Haemophilus influenzae* type b, and oral poliovirus vaccines, but at different sites. Influenza vaccine should not be given within 3 days of vaccination with pertussis vaccine.

**WARNING! SOME PEOPLE SHOULD CHECK WITH A DOCTOR BEFORE TAKING INFLUENZA VACCINE:**

- Persons who should not be given the flu shot include those with an allergy to eggs that causes dangerous reactions if they eat eggs.
- Anyone who has ever been paralyzed with Guillain-Barré syndrome should seek advice from their doctor about special risks that might exist in their cases.
- Women who are or might be pregnant should consult with their doctor.
- Persons who are ill and have a fever should delay vaccination until the fever and other temporary symptoms have gone.

**QUESTIONS:**

If you have any questions about influenza or influenza vaccination, please ask now or call your doctor before requesting the vaccine.

**REACTIONS:**

If anyone receiving influenza vaccine gets sick and visits a doctor, hospital, or clinic in the 4 weeks after vaccination, please report this to: **the clinic where this vaccine was administered or to your local health department.**

**PLEASE KEEP THIS PART OF THE INFORMATION SHEET FOR YOUR RECORDS**

*I have read or have had explained to me the information on this form about influenza and influenza vaccine. I have had a chance to ask questions which were answered to my satisfaction. I believe I understand the benefits and risks of influenza vaccine and request that the vaccine be given to me or to the person named below for whom I am authorized to make this request.*

# Our Pictures Are Worth A Thousand Words.™

## Case #17

A 66 year old female with transient episodes of left arm and leg weakness.

**DIAGNOSIS: Severe stenosis proximal right internal carotid artery and occlusion left internal carotid artery as diagnosed by MRA — Magnetic Resonance Angiography.**

Figure 1 MRA image demonstrates marked stenosis of the proximal right internal carotid artery (arrow) which closely correlates to the high grade stenosis demonstrated by digital subtraction angiography (arrow Figure 2). Figure 3, a base view MRA through the Circle of Willis, demonstrates absence of signal within the left internal carotid artery (arrowhead). This corresponds with the occlusion of the left internal artery demonstrated in Figure 2 by DSA (arrowhead).

MRA provides a non-invasive, 3-dimensional study of the extracranial carotid arteries and Circle of Willis without the associated risks of catheterization or injection of contrast media. It is a sensitive and extremely safe screening technique for patients with extracranial or intracranial atherosclerotic disease. The study is performed as an adjunct to cranial Magnetic Resonance Imaging requiring only six to eight minutes of scan time. This technique is also useful in evaluating aneurysms and vascular malformations as well as vertebrobasilar disease.

At Drs. Copeland, Hyman & Shackman, P.A. we are proud of our high resolution, state-of-the-art imaging. We look forward to consulting with you on any diagnostic imaging procedure in order to best serve you and your patients in the most expeditious and economic manner.

We provide convenient evening and week-end hours at both MRI locations, double-readings for quality assurance, and FAX capabilities for delivering reports immediately.

**You work hard to gain your patients' trust and confidence. At Drs. Copeland, Hyman & Shackman, we'll help you keep it.**

## Drs. Copeland, Hyman & Shackman P.A.

# STATE OF THE ART

---

## DIAGNOSTIC TECHNOLOGY

---

Magnetic resonance imaging (MRI) is an important tool for today's physician. MRI produces VIVID images of the body in multiple planes. It is a painless procedure that does not involve surgery or potentially harmful radiation. MRI is frequently recommended for evaluation of neural, spinal, articular and pelvic disorders. It is safe and cost effective, and its various applications are being expanded at an impressive rate.

Health Images facilities are a community resource available to all area physicians.

The MRI Company

# *Catastrophic Illness is Rare and the Treatment is Critical.*

You know the patient. The one with chronic psychosis that hasn't responded to general inpatient care. The patient has comprehensive coverage so you've been able to admit him time and time again for inpatient care. But there's been little if any improvement, and you're frustrated. It's time to refer him to a hospital that is committed to treating the long term refractory patient and has the resources to do it. Sheppard Pratt.

Today's literature discourages long term hospitalization, and we agree. That same literature does, however acknowledge that a small group of chronic patients cannot be treated any other way. In 1984, Sheppard Pratt opened an 18 bed unit that treats only those types of patients.

We are not talking about custodial care nor do we treat patients who spend years talking about delusions. We provide long term, active, behavioral, psychopharmacological treatment for those patients who can genuinely be helped.

In addition to managing systematic and aggressive medication trials, our patients live within an established token economy. Patient education and social skills programming, and specialized activity therapy are provided daily throughout treatment. Formalized psychoeducation is also a vital component of treatment and family involvement. Comprehensive discharge planning is given attention equal to inpatient care. Sheppard Pratt provides many options for aftercare including a quarterway house, supervised housing, vocational training, outpatient therapy and medications management, and day hospitals.

Sheppard Pratt is a comprehensive network of psychiatric services. In addition to our 322 bed hospital we maintain the 16 bed Mt. Airy House, numerous community outreach programs and the National Center for Human Development. For more than 100 years, Sheppard Pratt has earned its reputation for providing quality care to the chronically ill patient. And during these difficult economic times, we remain loyal to that heritage.

For further information or to make a referral contact the Adult Admissions Office at:  
(301) 938-3800  
6501 North Charles Street  
Baltimore, Maryland 21285-5815

November 1991

---

## *Med Chi Semiannual Meeting Actions*

---

Dominating the agenda at Med Chi's Semiannual Meeting in Ocean City this year were three major policy issues: mammography screening, radiation technologist qualifications and HIV testing. During special sessions at the meeting, Med Chi members and expert panels dedicated time to discussing these issues in order to formulate Med Chi policy on each of them.

### *Mammography Screening*

The issue of mammography screening involves promulgation of the standards outlined in House Bill 408, the preamble of which reads:

"Whereas, 1 in 10 women will get breast cancer; and

Whereas, Mammograms, if taken by faulty equipment or read by unqualified personnel, could threaten the lives of Maryland citizens with excessive radiation and the failure to detect treatable cancer; and

Whereas, The citizens of Maryland should be receiving consistently high quality mammograms delivered by qualified health care professionals using safe and accurate equipment, regardless of their geographic location in the State; and

Whereas, With the expected increase in the number of mammography testing centers in Maryland and on a nationwide basis, standards and criteria should be established for mammography testing and equipment..."

After a discussion by the panel members, including Henry Maganzini MD, Chairperson of Med Chi's Committee on Public Health, and Lawrence E. Holder MD, FACR, President, Maryland Radiological Society, the Med Chi House of Delegates accepted the report of the special ad hoc committee which supports the American College of Radiology's standards and the Health Care Financing Administration's standards for mammography screening. This vote includes the recommendations that no other standards be developed at this time and is supported by the Maryland Hospital Association. For a copy of Med Chi's issue packet on Mammography Screenings, contact Med Chi's Communications Department at 301-539-0872 or 1-800-492-1056.

### *Radiation Technologists*

Related, in part, to the equipment and dosage standards for mammography screening, is the issue of radiation technologist qualifications, also contained in HB 408. At the panel discussion, this issue resulted in the House of Delegates accepting the report of the special ad hoc committee which recommended that an x-ray assistant be an individual who will not be a radiation technologist but rather a medical assistant who would take x-rays in a medical office under a physician's supervision. Training for x-ray assistants would assure safety to both patients and staff. For a copy of Med Chi's issue packet on x-ray assistants, contact Med Chi's Communications Department at 301-539-0872 or 1-800-492-1056.

### *Practice Protocol for Physicians with HIV*

Med Chi's Committee on AIDS, in consultation with the Centers for Disease Control (CDC), the Maryland Hospital Association, and the Department of Health and Mental Hygiene, developed a practice protocol for physicians who are infected with HIV, in accordance with House Bill 124 passed by the Maryland General Assembly during its 1991 session.

The protocol outlines the procedures that infected physicians should follow

in order to determine what, if any, limitations would be placed on their practice if they are infected with HIV. These steps include appearing before an expert panel, signing an advocacy contract and refraining from the performance of invasive procedures in some cases. In addition, the protocol defines "HIV Positive Physician" and "High Risk Procedures." The protocol is consistent with the CDC guidelines and does not recommend mandatory testing.

Two sections in the protocol on the advocacy contract and physician compliance were extracted from the protocol to be reviewed by Med Chi's legal counsel and to be evaluated by Med Chi's Council on November 21, 1991. Pending Council approval, the protocol will be forwarded to the Maryland Legislature on December 2, 1991. Med Chi will closely monitor its progress from there and keep physicians in Maryland informed on this critical issue. For a copy of Med Chi's Practice Protocol for Physicians with HIV, contact Med Chi's Communications Department at 301-539-0872 or 1-800-492-1056.

---

### *Certification of Medical Radiation Technologists and Nuclear Medical Technologists*

---

Please be advised that the Board of Physician Quality Assurance (BPQA) anticipates that the enforcement date of Regulations .01-.11 under COMAR 10.32.10, Certification of Medical Radiation Technologists and Nuclear Medicine Technologists, will be January 2, 1992.

This means that an individual may not practice medical radiation technology or nuclear medical technology unless certified or temporarily certified by the BPQA by January 2, 1992.

---

### *Mandatory Testing of Health Care Workers*

---

On September 20, Governor Schaefer told his new AIDS Advisory Council that he favors mandatory testing of health care workers and patients for HIV. Med Chi's Committee on AIDS is currently studying implications of the Governor's proposal and intends to initiate a campaign to educate legislators and Maryland citizens on the data surrounding HIV transmission from physician to patient and the costs of a mandatory testing program. All physicians are encouraged to write to their Maryland legislators and urge them to oppose mandatory testing of HIV. Watch the *Executive Director's Newsletter* for more information regarding this issue or contact Betsy Newman, Med Chi Public Relations Director, at 301-539-0872 or 1-800-492-1056.

---

### *President's Regional Conference-Western Maryland*

---

Many physician members representing the five western Maryland counties attended Med Chi's President's Regional Conference in Hagerstown on October 3, 1991. During the meeting, President J. David Nagel MD presented updates on several critical Med Chi issues including HIV testing, mammography regulations and x-ray assistant guidelines. Med Chi thanks Frederick County Medical Society President, Henry P. Laughlin MD, ScD, ScSD, and Washington County Medical Society President, John G. Newby MD, for serving as co-hosts for the conference.

---

### *Drug Conference*

---

Med Chi's "Second Annual Conference on Addiction: Prevention, Recognition and Treatment" will be held on Saturday, November 16, 1991 in the Med Chi Faculty Building. The conference will help physicians care for patients with addiction problems and fulfills seven continuing medical education credits. The first 150 registrants to the conference will receive a free copy of the 1990 addiction conference monograph. A program and a registration form appear on page 1040 of this MMJ.

# PHARMACY ALERT

## SUPPLEMENTARY LIST OF DRUGS COVERED UNDER MARYLAND (DHMH) PHARMACY ASSISTANCE PROVISIONS

EFFECTIVE OCTOBER 1, 1991

1. This list is a supplement and revision to the "List of Covered Drugs" published in Pharmacy Assistance Program Transmittal #1 and should be used in conjunction with that list.
2. All listed drugs are limited to a less than 34 days supply, except for the maintenance drugs marked with an asterisk. Up to a 100 days supply for these indicated drugs may be dispensed at one time. The prescriptions for all covered products are limited to an original and up to two refills, the total amount not to exceed a 100 days supply.  
In extenuating circumstances, permission may be obtained to dispense larger amounts, up to a 100 days supply of any covered drug by calling the Medical Assistance Preauthorization Desk at (301) 225-1755 or, from outside the local calling area only 1-800-492-6008 (toll free).
3. The brand names listed are an aid to identification. Other brands of the same drugs are also covered.
4. Commercially available products containing two or more active ingredients will be covered if one of the active ingredients is covered in the therapeutic category for which the product is to be used. Extemporaneously compounded products containing active ingredients which are not covered are not eligible for payment.
5. Newly marketed products in categories which are not limited to specifically listed items will be covered even though they are not listed.
6. While anti-infective products are covered for both acute and chronic care, all other products are covered only for the treatment of chronic conditions on a long term basis. Therefore, notation of the indication for use must be made on the prescription by the prescriber where limited indications for use are listed in the category. e.g. Opioid agonists are covered for use in chronic pain experienced by the terminally ill.
7. Over-the-counter drugs except those specified (aspirin and insulin) are not covered. Products evaluated as "less than effective" or otherwise restricted from payment by the Health Care Financing Administration (HCFA) are not covered.

THE FOLLOWING ADDITIONAL PRODUCTS ARE COVERED, EFFECTIVE OCTOBER 1, 1991:

GENERIC NAME	BRAND NAME	GENERIC NAME	BRAND NAME
<b>10:00 **Antineoplastic Agents</b>		<b>12:08.04** Antiparkinsonian Agents</b>	
	<i>Listed products only.</i>		
Chlorambucil	Leukeran	Pergolide	Permax
Cyclophosphamide	Cytoxan	Diphenhydramine HCl	Benadryl - for use as an antiparkinson agent only
Hydroxyurea	Hydrea		
Interferon Alpha**	Intron A, Roferon A	<b>12:08.08 Antimuscarines/Antispasmodics</b>	
Leuprolide Acetate	Lupron		<i>Listed products only.</i>
Megesterol Acetate	Megace		
Methotrexate	Folex	Dicyclomine	Bentyl - only for ulcerative colitis & irritable bowel syndrome
Tamoxifen Citrate	Nolvadex		

\* allowed in up to a 100 days supply

\*\* previously listed classification or product

---

## *President's Regional Conferences-Eastern & Southern Maryland*

---

The President's Regional Conference on the Eastern Shore is scheduled for November 14, 1991 at 4:30 pm at the Blue Crab restaurant in Cambridge, Maryland. The President's Regional Conference for southern Maryland is scheduled for March 12, 1991. Watch the Executive Director's Newsletter for more information about these conferences or contact Norbert Picha, Med Chi Deputy Executive Director, at 301-539-0872 or 1-800-492-1056.

---

## *Doctor/Lawyer/ Teacher Partnership*

---

Physicians in Baltimore City are needed to spend a few hours of their time to help prevent drug abuse in Maryland's children. As a physician volunteer in the Doctor/Lawyer/Teacher Partnership Against Drugs, you will visit a classroom of students in your area to discuss medical dangers of using drugs. Your lawyer partner will emphasize the legal consequences of drug use.

Training sessions will be held on Tuesday, January 14 and Wednesday, January 22, 1992 in the Med Chi Faculty Building for physicians interested in participating in this program. To volunteer or for more information, contact Betsy Newman, Public Relations Director, at 301-539-0872 or 1-800-492-1056.

---

## *Annual Meeting*

---

Med Chi's 1992 Annual Meeting will be held Thursday-Saturday, April 30-May 1, at the Omni International Hotel in Baltimore. AMA Trustee Thomas R. Reardon recently accepted Med Chi's invitation to be a featured speaker at the meeting. Watch the Executive Director's Newsletter for more meeting and program information.

---

## *Performing Arts Medicine Conference*

---

Med Chi's Committee on Medicine and the Performing Arts is sponsoring a conference on January 24-25 titled, "Performing Arts Medicine: Issues in Diagnosis and Management." For more information about this conference, which will be held in the Med Chi Faculty Building, contact Susan Harman at 301-539-0872 or 1-800-492-1056.

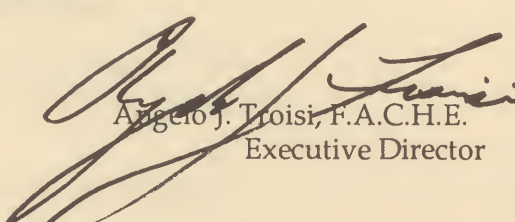

---

## *Pharmacy Assistance Program Alert*

---

Following this newsletter are revisions and additions in coverage under the Pharmacy Assistance Program (PAP) published in PAP Transmittal no. 1, effective June 1, 1991 as emergency provisions. These amendments limit coverage to anti-infective drugs and maintenance drugs for chronic diseases. The co-payment for all covered services is \$4.00. The Program has re-evaluated the list of therapeutic categories and added both additional categories and drug products in addressed categories.

In order to implement a revised list as soon as possible, the Pharmacy Assistance Program is again proposing, through the emergency process, amendments to Regulation .04 under COMAR 10.45.01 Eligibility and Regulations .01 and .03-.05 under COMAR 10.45.02 Services. These amendments which contain the revised list became effective October 1, 1991. The Department is proposing to adopt the amendments on a permanent basis, effective February 1, 1992.

## **THE MARK OF EXCELLENCE**

### Histoplasmosis is Endemic in the Potomac River Valley

The interesting article by Sauri et al on disseminated histoplasmosis in AIDS patients in Maryland (July 1991) is a good warning to watch for this complicating disease in areas of endemic histoplasmosis.<sup>1</sup> However, their implication that a travel history is helpful in arriving at a diagnosis fails to recognize that in addition to the Ohio, Mississippi, and St. Lawrence River valleys (which they specifically mention), the Potomac River valley is also an endemic area. Some of the initial studies on histoplasmosis were done in Loudon County, VA, and Washington, DC.<sup>2,3</sup> A series of maps of the distribution of histoplasmin sensitivity among Navy recruits shows that more than 50 percent of the lifetime residents of Washington, Frederick, and Harford Counties had been infected with histoplasmosis and that only in Garrett and Allegany Counties was infection uncommon.<sup>4</sup> Histoplasmin testing of high school students in Montgomery County showed that 71 percent of lifetime residents of the northwestern part of the county had been infected.<sup>5</sup> In Frederick County, 42 percent of sixth grade students reacted to histoplasmin<sup>6</sup> as did 55 percent of high school students who were lifetime residents of Washington County.<sup>7</sup>

In much of Maryland, and particularly along the middle Potomac River valley, it is not necessary to have traveled to be at high risk of having been infected by *Histoplasma capsulatum*.

### Potential for Missed Diagnosis in Rehabilitation Patients with a High-risk Lifestyle

There is little doubt among clinicians working in rehabilitation that a syndrome of premorbid pathology exists in which some patients have observed high-impulse, high-risk lifestyles that predispose them to injury. These patients frequently lack strong ties to such social institutions as marriage or work. Included in these high-risk lifestyles are the reckless use of automobiles and motorcycles, and a greater exposure to persons with guns and knives and a willingness to use them. Alcohol is known to be a risk factor related to both violence and motor vehicle injuries.<sup>1</sup>

This is evidenced in patients seen during their early years on the Montebello Traumatic Injury Rehabilitation Units. For example, an examination of spinal cord patients admitted from 1979 to 1984 shows that more than 50 percent of patients had a history of alcohol abuse; 37.3 percent of auto accident patients and 31 percent of gunshot wound patients had histories of alcohol and drug dependence.<sup>2</sup> On the Head Injury Unit in 1987, 29 percent of patients had a reported history of alcohol abuse alone, 13 percent drug abuse alone, and 24 percent a combined alcohol and drug abuse history. In all, approximately two-thirds had a reported history of substance abuse. Alcohol use has been implicated in increasing lengths of stay (LOS) in the acute care and rehabilitation facilities after head injury.<sup>3-4</sup>

Alcoholism is traditionally underreported and/or unrecognized in the health care setting. This may be attributed to staff inexperience, denial that a "nice" patient may have a dependency, or a reluctance to label an already stigmatized disabled person with still another label.<sup>5</sup> In addition, American society is very much in conflict about acceptable levels of alcohol and drug use. It is estimated that 6 percent of nurses and 10 to 13 percent of licensed physicians in the United States have alcohol or other drug dependencies. Thus, internal conflicts manifest themselves in either too liberal or too strict attitudes about substance abuse.<sup>6</sup>

Prevention of injury and tertiary physical problems related to alcohol abuse needs to be addressed by front-line physicians with referrals to and support of other professionals. As health planning becomes more cost conscious, and the association between physical disability and substance abuse is more clearly delineated, insurance companies are more willing to fund treatment of these conditions before they lead to permanent disability. Physicians and other health care professionals must learn and convey more information about these dangerous dependencies and their permanent and debilitating consequences.

## PHYSICIAN'S RECOGNITION AWARD

During July 1991, the physicians listed below received the American Medical Association's (AMA's) Physician's Recognition Award. Established in 1968, the Award's purpose is to encourage physician participation in continuing medical education and to recognize those physicians who have voluntarily completed programs of continuing medical education.

For excellent response in the treatment of  
duodenal ulcers...

**AXID**<sup>®</sup> nizatidine

has the right answers

- Rapid epigastric pain relief<sup>1,2\*</sup>
- Fast and effective ulcer healing<sup>2,3,4</sup>

**AXID**  
**PASSES THE ACID TEST**

\*Most patients experience pain relief with the first dose.  
See adjacent page for references and brief summary  
of prescribing information.

## AXID® (nizatidine capsules)

**Brief Summary.** Consult the package insert for complete prescribing information.  
**Indications and Usage:** 1. Active duodenal ulcer—for up to 8 weeks of treatment. Most patients heal within 4 weeks.

2. Maintenance therapy—for healed duodenal ulcer patients at a reduced dosage of 150 mg h.s. The consequences of therapy with Axid for longer than 1 year are not known.

**Contraindications:** Known hypersensitivity to the drug. Because cross sensitivity in this class of compounds has been observed, H<sub>2</sub>-receptor antagonists, including Axid, should not be administered to patients with a history of hypersensitivity to other H<sub>2</sub>-receptor antagonists.

**Precautions:** General—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.  
3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

**Laboratory Tests:** False-positive tests for urobilinogen with Multistix® may occur during therapy.

**Drug Interactions:** No interactions have been observed with theophylline, chloridazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

**Carcinogenesis, Mutagenesis, Impairment of Fertility:** A 2-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a 2-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a 2-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

**Pregnancy—Teratogenic Effects—Pregnancy Category C:** Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect, but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in 1 fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spinal bifida, hydrocephaly, and enlarged heart in 1 fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

**Nursing Mothers:** Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

**Pediatric Use:** Safety and effectiveness in children have not been established.

**Use in Elderly Patients:** Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

**Adverse Reactions:** Clinical trials of varying durations included almost 5,000 patients. Among the more common adverse events in domestic placebo-controlled trials of over 1,900 nizatidine patients and over 1,300 on placebo, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common with nizatidine. It was not possible to determine whether a variety of less common events were due to the drug.

**Hepatic:** Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to 3 times the upper limit of normal, however, did not significantly differ from that in placebo patients. All abnormalities were reversible after discontinuation of Axid. Since market introduction, hepatitis and jaundice have been reported. Rare cases of cholestatic or mixed hepatocellular and cholestatic injury with jaundice have been reported with reversal of the abnormalities after discontinuation of Axid.

**Cardiovascular:** In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in 2 individuals administered Axid and in 3 untreated subjects.

**CNS:** Rare cases of reversible mental confusion have been reported.

**Endocrine:** Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to nizatidine. Impotence and decreased libido were reported with equal frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

**Hematologic:** Fetal thrombocytopenia was reported in a patient treated with nizatidine and another H<sub>2</sub>-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

**Integumental:** Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

**Hypersensitivity:** As with other H<sub>2</sub>-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

**Other:** Hyperuricemia unassociated with gout or nephrolithiasis was reported.

**Overdosage:** Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis does not substantially increase clearance of nizatidine due to its large volume of distribution.

## Which Box Would You Rather Deposit Your Insurance Reimbursements In?

If you process your claims through the mail, it takes an average of two months before your reimbursements make it to the bank.

And that can really put you in a box in terms of cash flow.

But not if you join the more than 1800 physicians who are now using HCS electronic claims systems. On the average, they receive payments in days, instead of months. Reason enough to consider using our custom designed systems.

What's more, our systems are labor savers. Stacks of claims that used to take weeks to process by mail can be sent through our claims

network in a matter of hours. Saving you enormously in administrative time. Not to mention postage.

And since HCS has the backing of a billion dollar health care organization, you can depend on us for long term support, service, and solutions as your office needs change.

Call Toll-Free 1-800-543-6711 for more information. Because in rain, snow, sleet or hail, we can deliver insurance reimbursements faster.

Kaczmarek MD, MPH, HFZ-161, Center for Devices and Radiological Health, 12200 Wilkins Ave., Rockville, MD 20852.*

Needle-stick injuries have long been recognized as an important occupational hazard for health care workers (HCWs). Needles are ubiquitous devices in the health care setting. They are used for a myriad of purposes, including medication administration, phlebotomy, and arterial blood gas procedures.

Consequently, many HCWs are at risk for needle-stick injury. Twenty diseases have been reported to be transmitted by this route, including malaria, brucellosis, blastomycosis, and staphylococcal infections.<sup>1</sup>

Needle-stick transmission of blood-borne viruses is of particular concern. Both the hepatitis B virus (HBV) and the human immunodeficiency virus (HIV) are known to be transmitted by this route. The risk of transmission by needle-stick is greater for HBV, probably because of the greater concentration of HBV in serum.<sup>2</sup> It has been estimated by the Centers for Disease Control (CDC) that the occupational transmission of HBV occurs in 12,000 HCWs each year.<sup>3</sup> Needle-sticks are one of the most significant causes of such transmission. Adverse sequelae of HBV infection include acute fulminant hepatitis, cirrhosis of the liver, and hepatocellular carcinoma.<sup>4</sup>

Although the risk of HIV transmission is relatively low following a needle-stick injury involving an HIV-infected patient (approximately one in 250 or 0.4 percent),<sup>2</sup> the risk of experiencing such an injury may be appreciable. A survey of New York City resident physicians reported that 36 percent of medical residents and 16 percent of pediatric residents

suffered needle-stick injuries when performing procedures on known HIV-infected patients. It is particularly worrisome that some respondents reported multiple needle-stick injuries involving known HIV-infected patients.<sup>5</sup>

Safe and effective curative therapy for HIV infection is not currently available. Similarly, an effective vaccine against HIV infection does not exist. The elimination of the occupational transmission of HIV by needle-stick injury must rest on prevention efforts.

The purpose of our multistate investigation was to observe and assess needle handling by HCWs performing routine procedures.

### Materials and Methods

The multistate investigation was conducted as a collaborative effort of the Center for Devices and Radiological Health (CDRH), the Food and Drug Administration, and the state health departments of Iowa, Maryland, and Massachusetts. A total of twenty-six health care facilities, consisting of twenty-two hospitals and four ambulatory care centers, participated in the investigation. The facilities were chosen subject to certain restrictions. Each state enlisted the participation of at least eight health care facilities. At least five of these facilities were required to be university-affiliated hospitals.

Concern for the occupational transmission of HIV may alter facilities' needle-handling policies and health care workers' compliance with such policies. The acquired immunodeficiency syndrome (AIDS) epidemic has not uniformly affected all health care facilities.<sup>6</sup> This has been caused, in part, by substantial interregional differences in the prevalence of HIV infection and AIDS. Because of intra-state regional differences, states were required to select at least one facility each from areas with population-adjusted cumulative incidences of AIDS substantially above and substantially below the statewide average.

Demographic information characterizing the participating facilities was collected. This information included bed size (for hospitals), percentage of Medicaid admissions, and annual number of admissions of known AIDS patients. The population-adjusted cumulative incidence of AIDS in the county in which each facility is located was noted and compared to its statewide counterpart.

To determine the facilities' compliance with the needle-handling recommendations made by the CDC, protocols regarding needle handling were reviewed and interviews were conducted with relevant personnel, such as infection control practitioners and environmental services directors.<sup>3</sup> CDC recommendations include not clipping, bending, or recapping needles, as well as disposing of needles in puncture-proof containers located near the site of use (e.g., in patients' rooms).

Actual needle handling by HCWs was observed. The vast majority of the 358 observations of the handling of con-

taminated needles by HCWs during routine procedures, such as phlebotomy and arterial blood gas drawing, were made directly. In one state, direct observation was supplemented by a limited number of observations of discarded needles. Observations were made in a range of locations, including emergency rooms, outpatient departments, inpatient nursing units, and radiology suites. Personnel observed included nurses, physicians, respiratory technicians, and phlebotomists.

### Results

A broad demographic mix of hospitals participated in the multistate investigation. Hospital size, characterized by the number of licensed beds, extended across a wide spectrum. Eleven hospitals had more than 300 licensed beds, eight had 100 to 300 licensed beds, and three had fewer than 100 beds. The relative proportion of privately insured and Medicaid patients treated by the respective hospitals also varied widely. At three hospitals, more than 20 percent of the discharged patients were Medicaid recipients. The proportion of Medicaid patients discharged at seven of the hospitals ranged from 10 to 20 percent. Twelve hospitals provided care to predominantly privately insured patients; less than 10 percent of discharged patients were Medicaid recipients. All four ambulatory care centers had patient populations comprised of less than 10 percent Medicaid recipients.

The number of AIDS patients treated at each facility varied considerably. Three hospitals provided care to substantial numbers of AIDS patients; each year more than fifty AIDS patients were admitted at each facility. Five hospitals had twenty-one to fifty annual admissions of AIDS patients. Thirteen hospitals had 20 or fewer such admissions per year. All four ambulatory care centers and one hospital never provided care to a known AIDS patient.

Based on protocol reviews and interviews with relevant personnel, the fundamental CDC recommendations regarding needle handling had been incorporated into the policies of all of the facilities. Policies prohibited needle bending, clipping, or recapping, and all facilities used puncture-proof needle disposal containers.

A total of 358 observations were made of needle handling by HCWs and/or of discarded needles (Table 1). Needle bending was not observed. The prevalence of needle clipping or other forms of needle breakage was 0.6 percent. The prevalence of needle recapping was 21.5 percent. Needle recapping was observed in all investigated locations, includ-

Table 1. Observed Non-compliance with CDC Needle-handling Recommendations

Observation	Prevalence (%)
Needle bending	0
Needle clipping/breakage	0.6
Needle recapping	21.5
Failure to dispose used needle in puncture proof container	0.9

ing emergency rooms, radiology suites, outpatient departments, and inpatient nursing units.

Two-handed and one-handed needle recapping were observed (Table 2). Two-handed recapping occurs with the needle cap held by the HCW. One-handed recapping occurs without the HCW holding the needle cap during the recapping process; it is accomplished by scooping the needle into the cap that is untethered or held by a device, not the health care worker's hand. The prevalence of two-handed recapping was 17.8 percent, and the prevalence of one-handed recapping was 3.6 percent.

Puncture-proof needle disposal containers were observed at all of the participating facilities. At twenty-four (92 percent) facilities, these containers were always present in patients' rooms and examination areas. At one (3.8 percent) facility, the containers were not available in all of the observed locations. Another facility placed its needle disposal containers at nursing stations, not in patients' rooms. A total of 99.1 percent of the needles used by HCWs were disposed of in puncture-proof containers.

### Discussion

The incorporation of CDC recommendations into the needle-handling policies of all participating facilities strongly suggests that these recommendations have been widely received and implemented by health care facilities' infection control practitioners. Several factors may have contributed to the high degree of compliance with CDC recommendations. First, the CDC recommendations were clearly written and well-publicized. Second, medicolegal concerns may have played a role. Lawsuits have been filed against hospitals by HCWs who suffered needle-stick injuries.<sup>7</sup> Concerns regarding legal liabilities, particularly from needle-stick transmission of HIV, may have expedited the adoption of CDC guidelines. Third, the Department of Labor has promoted the adoption of the CDC recommendations. A 1987 Department of Labor/Department of Health and Human Services Joint Advisory Notice advised employers to develop "specific and detailed procedures to be observed with sharp objects, e.g. needles."<sup>8</sup> Furthermore, employers must provide readily accessible puncture-proof containers for needle disposal.

Several results from the observation of needle handling by HCWs are encouraging. Less than 1 percent prevalence of needle bending or clipping suggests these archaic practices may have been extinguished. The education of HCWs regarding appropriate needle handling may be netting significant dividends in this area. The prompt disposal of used needles in puncture-proof containers more than 99 percent of the time is particularly encouraging. The rapid disposal of

needles in such containers can help protect housekeeping staff from needle-stick injury. Past studies have demonstrated that housekeeping staff are at risk for needle-stick injuries from needles left in bedsheets, in wastebaskets, and on tables. One study reported that 17.4 percent of all needle-stick injuries occurred among housekeeping staff.<sup>9</sup> These data also suggest widespread compliance with recommendations to locate needle-disposal containers at the sites of use (e.g., patients' rooms). The location of needle-disposal containers in this fashion decreases the potential for needle-stick injury during the process of transporting the needle to the disposal container.

The substantial observed prevalence and widespread nature of needle recapping indicates it remains a serious problem. Several factors may explain why the observed high rate of compliance with other CDC recommendations did not extend to needle recapping. First, negative learning may help explain the persistence of needle recapping. Many HCWs, including one of the authors (RGK), were actively taught during training to recap needles. Second, safety concerns may promote recapping. Jagger et al reported that, based on her interviews, many HCWs recap needles because they are afraid they may injure other HCWs with an uncapped needle.<sup>1</sup> Third, certain medical procedures, such as an arterial blood gas, require manual needle removal that can be accomplished by recapping.

Because arterial blood gas procedures are performed frequently on AIDS patients, needle recapping during this procedure is of particular importance. The leading cause of death in AIDS patients is *Pneumocystis carinii* pneumonia.<sup>10</sup> The management of *Pneumocystis carinii* and other pneumonias requires frequent arterial blood gas determinations. It is also important to note that many AIDS patients undergo multiple hospitalizations for *Pneumocystis carinii* infections. Needle recapping during arterial blood gas procedures with conventional equipment may often create the potential for occupational needle-stick transmission of HIV.

Two approaches -- education and engineering changes -- should be followed to reduce needle-stick injuries. Our data suggest that HCWs require further education in order to cease needle recapping. Reminding recalcitrant HCWs that needle disposal containers have been moved from nursing stations into patients' rooms may make them more comfortable in handling uncapped needles. Potential engineering changes encompass a broad spectrum of possibilities. It should not be overlooked that, holding all other factors constant, substituting procedures not requiring needles for procedures requiring needles will reduce the incidence of needle-stick injuries. A number of devices designed to reduce the frequency of needle-stick injuries have been developed.<sup>11</sup> These safety features include retracting the needle into the barrel or sliding a protective safety sheath over the needle after use. The AIDS epidemic may provide the impetus for further development and widespread utilization of safer needles. Prior to the onset of the AIDS epidemic, the case was compelling for measures to reduce the frequency of needle-stick injuries. With the

Table 2. Needle Recapping

Type of Recapping	Prevalence (%)
One-handed	3.6
Two-handed	17.8
Total	21.5

dramatic increase in the prevalence of HIV infection and its increasing geographic diffusion, the case in favor of measures to reduce the frequency of needle-stick injury is overwhelming. This study's data suggest that progress in promoting appropriate needle handling has been made, but that more work remains to be done.

Meridian Nursing Center—Heritage

#### **Partners in Healthcare**

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer's patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at all our nursing centers. And special services like short-term or respite care, our own

pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dietitians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—  
The Professional Choice.

# Pregnancy and Addiction: Outcomes and Interventions

---

Mary E. McCaul PhD, Dace S. Svikis PhD  
and Terry Feng MD

---

*From The Johns Hopkins University School of Medicine where Dr. McCaul is Associate Professor and Dr. Svikis is Assistant Professor, Department of Psychiatry and Behavioral Sciences, and Dr. Feng is Assistant Professor, Department of Gynecology and Obstetrics.*

---

*Cocaine use by pregnant women has increased dramatically in recent years, resulting in well-documented consequences for mothers and offspring. However, even a once weekly peer-oriented intervention can have a positive impact on pregnancy outcome for drug-using women.*

---

It has been estimated that 11 to 20 percent of pregnant women in the United States have a problematic pattern of alcohol and/or illicit drug use.<sup>1-5</sup> Cocaine use accounts for up to half of these cases, with prevalence ranging from 3 to 17 percent.<sup>2,4,6</sup> Other drugs often abused by pregnant women include alcohol and marijuana.<sup>7-9</sup> One of the most widely used and frequently overlooked drugs is nicotine, with a prevalence of 28 to 54 percent.<sup>8-12</sup> It is important to point out that polydrug use/abuse currently seems to be the rule rather than the exception,<sup>3,4,13,14</sup> particularly when nicotine is included in the abuse profile. These estimates of drug use by pregnant women most likely represent a gross underestimation of actual use due to social and psychological pressures to deny substance use during pregnancy and the illicit nature of much of this drug use.<sup>15</sup>

In some studies, drug use estimates in urban obstetrical clinic populations have been reported as even higher than general population estimates.<sup>8</sup> However, a recent study by Chasnoff and colleagues<sup>7</sup> demonstrated that patients in both public and private settings are at risk for drug use and should be interviewed concerning their alcohol and other drug use. Specifically, urine toxicology screens were obtained on all women enrolled in prenatal care at five county health clinics and twelve private obstetric (OB) practices in Florida during the first six months of 1989. Pregnant women seen at public clinics and those examined in private practices tested positive for alcohol or illicit drugs at approximately the same rate, that is, 16.3 percent positive in public clinics and 13.1 percent in private clinics. Similarly, black and white pregnant women tested positive at comparable rates, with approximately 15 percent of both groups testing positive for alcohol or any illicit drug. There was an interesting difference in the drug most commonly used by black versus white women. Cocaine use was evident in 7.5 percent of black OB patients but in only 1.8 percent of white patients; whereas, marijuana use was evident in 14.4 percent of white patients as compared with 6 percent of black patients. As is now true in two other states (Minnesota and Illinois), Florida requires that women known to have used alcohol or illicit

drugs during pregnancy be reported to the health authorities. Despite the comparability in drug use prevalence in white and black OB patients, the Chasnoff et al study found marked differences in the frequency of physician reports of drug use between the two groups. Review of public health records indicated that black women were being reported at approximately ten times the rate of white women. These data suggest that drug use is common in pregnant women regardless of race and socioeconomic status; however, it appears to be differentially detected and reported based on the sociodemographic characteristics of the OB patient.

The high prevalence of drug use, with its frequent and sometimes severe complications to both mother and fetus, emphasizes the importance of identification of and intervention with pregnant drug abusers.

### **Obstetrical and Fetal/Neonatal Complications Associated with Drug Use**

The incidence of obstetrical complications in drug-using women is elevated compared with control populations of non-drug-using women. Complications specifically associated with cocaine use include reduced maternal weight gain, precipitous delivery, placental abruption (usually occurring shortly after drug use), preterm labor and delivery, spontaneous abortion, and meconium-staining.<sup>4,6,9,16-18</sup> Preterm labor and delivery and problems with spontaneous abortion have been well-documented in heroin addicts<sup>18-20</sup> and alcoholics.<sup>21-23</sup>

Provision of appropriate medical services for these OB complications is made more difficult by the failure of many of these women to seek adequate prenatal care.<sup>18</sup> For example, in an earlier study by Connaughton and colleagues,<sup>24</sup> pregnant women using illicit drugs were found to average only one prenatal visit, compared with nine visits in non-drug-using patients. More recently, Zuckerman and colleagues<sup>9</sup> examined prenatal clinic attendance of both cocaine- and marijuana-using women at a large, inner-city hospital. While women with no drug use averaged 9.2 prenatal clinic visits, women who used marijuana or who used cocaine had clinic attendance rates of 7.9 and 6.5, respectively.

Maternal drug use negatively impacts not only the mother's health status but the health of the fetus/neonate. The most obvious neonatal complication is drug withdrawal. Frequently observed withdrawal symptoms in neonates exposed to opiate drugs include central nervous system (CNS) hyperirritability, loose stools and other gastrointestinal dysfunctions, nasal stuffiness, yawning, sneezing, increased lacrimation, and fever.<sup>18,25-28</sup> Symptoms associated with cocaine withdrawal in neonates are less pronounced than those associated with opiate withdrawal. Cocaine withdrawal symptoms may include tremors, irritability, high-pitched and excessive crying, vigorous sucking, and hyperactivity.<sup>6,17,29-31</sup>

In addition to the risk of neonatal drug withdrawal, there is a high frequency of other fetal/neonatal complications

associated with maternal drug use. For example, Connaughton and colleagues<sup>24</sup> reported the overall morbidity incidence for neonates of drug-using mothers to be over twice that of controls, with the overall mortality rate being three times higher in drug-exposed infants. Similarly, Finnegan<sup>18</sup> reported a greater than two-fold increase in the mortality rate for infants born to heroin- and methadone-dependent women (5 percent) as compared with a control population (2 percent). This increased morbidity has been associated with a higher percentage of the neonates of drug-using mothers achieving Apgar scores less than 7.<sup>3,32,33</sup> In the fetuses of almost 50 percent of pregnant cocaine addicts,<sup>34</sup> suboptimal growth has been reported, with an increased incidence of intrauterine growth retardation and reduced weight, length, and head circumference at birth.<sup>4,9,10,35</sup> In general, the percentage of neonates with birthweights below 2,500 grams shows a two- to three-fold elevation in drug-exposed neonates as compared with control neonates.<sup>3,24</sup> Finally, Chasnoff and colleagues<sup>16</sup> reported a significantly increased incidence of sudden infant death syndrome (SIDS) in infants exposed to cocaine as compared with population base rates, although several more recent studies have failed to confirm these findings.<sup>36,37</sup> Similarly, a 2 to 3 percent incidence of SIDS has been observed in infants born to narcotic-using mothers.<sup>14</sup> It is important to note that an increased incidence of malformations, particularly genitourinary, cardiac, and CNS malformations, has been reported in infants delivered to cocaine-using mothers.<sup>4,9,14,16</sup> This variety of complications associated with fetal drug exposure is reflected in an almost four-fold increase in the length of hospitalization for drug-exposed neonates. Specifically, drug-exposed neonates have been reported to spend an average of twenty-two days in the hospital, compared with six days for the general population.<sup>24</sup>

### **Other Medical and Psychosocial Problems Associated with Drug Use during Pregnancy**

In addition to the direct, toxic effects of drug exposure on mother and child, substance abuse is associated with a variety of other problems that may have an adverse impact on pregnancy outcomes. There is an increased risk for intrauterine growth retardation which may be a result of nutritional deficits secondary to decreased intake or impaired digestion, absorption, or utilization of nutrients.<sup>10</sup> Also, the generally disorganized lifestyle of the substance abuser may contribute to inadequate prenatal care<sup>3</sup> and poor parenting skills.<sup>38</sup> The economic burden of supporting illicit drug use may lead to other illegal activities such as theft or prostitution which further decrease the likelihood of the user seeking health care while making her more susceptible to problems such as sexually transmitted diseases.<sup>9,39</sup> Use of unsterile or contaminated needles increases the risk for cellulitis, hepatitis,<sup>24</sup> and endocarditis.<sup>39</sup> Such infections in the mother can result in intrauterine or perinatal infection of the fetus as well.

Of even greater concern is the increasing prevalence of

human immunodeficiency virus (HIV) infection and acquired immunodeficiency syndrome (AIDS) in women of childbearing age. Eighty percent of women with AIDS in the US are between eighteen and forty years of age and thus have a reasonable likelihood of becoming pregnant prior to death.<sup>40</sup> As a result, there now is increasing vertical transmission of HIV from mother to neonate.<sup>41</sup> Among children with AIDS, the majority were born to mothers whose risk factor for HIV infection was intravenous (IV) drug use or sexual contact with an IV drug user.<sup>40-43</sup> It is projected that perinatal exposure will become the exclusive route by which children acquire HIV infection and the major source of this infection will be intravenous drug use by the mother or her sexual partner. Although only 20 to 50 percent of the children born to HIV-infected women actually become infected,<sup>41,43,44</sup> prognosis in children is dismal. Failure to thrive, loss of developmental milestones and intellectual abilities, and recurrent serious infections are hallmarks of this disease in children.<sup>40,42</sup> Even for children who escape infection, the developmental impact of living in a family disrupted by substance abuse and parental illness or death may have serious long-term consequences.<sup>40</sup>

#### **Physician Roles in Identification of and Intervention with Pregnant Drug Users**

The range and severity of obstetrical and fetal problems associated with drug use highlight the importance of physician identification and management of drug use during pregnancy.<sup>45</sup> Further, the recent finding of similar rates of positive urine drug toxicologies in private and public clinics emphasize the importance of all physicians adopting a more active role in this process. Screening for alcohol and drug use and associated problems should become a routine part of obstetrical histories and examinations. Brief yet effective screening instruments are available. An easily implemented interview is the 4-item TACE: (1) How many drinks does it take to make you feel high (Tolerance)? (2) Have people Annoyed you by criticizing your drinking? (3) Have you felt you ought to Cut down on your drinking? (4) Have you ever had a drink first thing in the morning to steady your nerves or get rid of a hangover (Eye opener)?<sup>46</sup> The Short Michigan Alcohol Screening Test (SMAST)<sup>47</sup> offers a paper-and-pencil self-administration option. Both the TACE and the SMAST can be adapted for identifying drug-related problems in addition to their more traditional use for alcoholism screening. In addition, toxicology screens can be useful for detecting recent drug use.<sup>7,9</sup>

When an alcohol or drug problem is identified, the physician should take an active role in conducting an intervention with the patient. This intervention should emphasize the positive gains for both mother and child that can result from cessation of drug use at any time during the pregnancy, and should introduce the patient to the benefits of substance abuse treatment involvement. A referral to treatment may be

appropriate, including community support groups, outpatient treatment programs, methadone maintenance for those women who are opiate dependent, and inpatient, residential, or detoxification services for those women who are in danger of experiencing withdrawal complications or who have not been able to stop their drug use on an outpatient basis.

Finally, it is critical that there be continued follow-up with the pregnant woman concerning her drug use. For example, drug use should be assessed at each prenatal and postpartum visit. A toxicology screen should be completed at the time of delivery to help guide care of the neonate and the mother. A linkage with social services may be important, especially for those women who have been unable to discontinue their drug use during their pregnancy.

#### **Treatment Strategies for Pregnant Drug-using Women**

To date, specialized services for pregnant substance users have been developed primarily in conjunction with fetal alcohol syndrome demonstration projects<sup>48,49</sup> and methadone maintenance programs.<sup>24,50,51</sup> Adopting a public health/education model, Little and colleagues<sup>48</sup> developed a three-component program for pregnant women with problematic alcohol use. The components include public education and professional training, assessment and counseling for individual women with alcohol-related problems, and program evaluation. In the Women's Clinic at Boston City Hospital, Rosett and colleagues<sup>52</sup> integrated therapy aimed at alcohol cessation and prenatal care for pregnant women who continued to drink heavily during their pregnancies. Patients participated in half-hour individual therapy sessions with the project psychiatrist and/or counselor; these sessions were scheduled in conjunction with the patients' regular prenatal clinic appointments (ranging from one to four times monthly). Sessions focused on decreasing alcohol and other drug use, allaying fears associated with delivery, strengthening family relationships, coping with real life problems, and addressing other issues important to the woman. Such programs have been very encouraging, with improved obstetrical and fetal/neonatal outcomes even when drug use was reduced but not eliminated.<sup>52,53</sup>

Recently, Finnegan<sup>18</sup> developed guidelines for the critical treatment components for managing drug-dependent women and their children. She has suggested that comprehensive programs include intensive prenatal management for high-risk pregnancies, psychosocial counseling, prenatal/parenting education classes, psychiatric therapy when necessary, and methadone maintenance when appropriate. In addition, the neonate should be carefully assessed and monitored for potential complications resulting from alcohol or drug withdrawal as well as other perinatal stressors associated with maternal addiction. Outcome information on these comprehensive treatment models for women are limited, and almost no data are available on overall drug use and

psychosocial functioning of the mother during and following program participation (e.g., most of the evaluation efforts have focused on obstetrical and neonatal outcome). The advantage of providing specialized services for women has been demonstrated in a recent study comparing such services with more traditional mixed-gender treatment programming.<sup>54</sup> This study found reduced alcohol consumption and improved social adjustment at two-year post-treatment follow-up in women receiving specialized female services as compared with control subjects. Even though these findings were not specific to pregnant women, they suggest the potential benefits of providing services uniquely tailored to the needs of women.

### A Comparison of Cocaine-using versus Other Drug-using Women

In the last several years, there has been increasing interest in and attention to the alcohol and drug use behaviors of obstetric patients in The Johns Hopkins Hospital Obstetrical Clinic. Screening for drug use has become a routine part of clinic intake and those women who are identified as alcohol or drug users are referred for a more in-depth assessment with a substance abuse specialist at the hospital. Based on patient availability, this assessment interview consists of either the Addiction Severity Index (ASI)<sup>55</sup> and the Family Alcohol and Drug Survey based on Family History - Research Diagnostic Criteria,<sup>56</sup> or the CAGE screening questions<sup>57</sup> and the SMAST.<sup>47</sup>

To examine the characteristics of these substance-abusing pregnant women, we conducted a record review of OB patients referred to the substance abuse specialist during a one-year period starting in April 1989; of particular interest was a comparison of patients referred as a result of cocaine use with those referred for use of other drugs. Of the women referred to the specialist, eighty-four or 64 percent were referred for cocaine use and forty-seven or 36 percent were referred for use of other drugs, including heroin (N=23), alcohol (N=19), and marijuana (N=5). While we are continuing our data collection on this project, we have summarized data from the 131 cases collected to date (Table).

Cocaine- and other drug-abusing pregnant women in our program are comparable in demographic characteristics; these women are generally in their mid-twenties and are predominantly black and single, with less than a high school education. Women in both groups reported an average of 1.5 children, excluding the current pregnancy.

For women who used cocaine as compared with other drug users, there was a significant elevation in the ASI severity ratings assigned by the substance abuse specialist for several areas of psychosocial functioning. Specifically, cocaine-using women were rated as being in greater need of medical, drug, and psychiatric treatment, as well as employment counseling; there also was a trend for a greater need for legal counseling. Despite these differences in treatment needs,

cocaine-using women were no more likely to have been previously enrolled in substance abuse treatment than other drug-using women. Over 80 percent of the women in both groups reported regular cigarette smoking during their current pregnancy; these high rates are in sharp contrast with the much lower rates of cigarette smoking (18 percent) observed in a demographically comparable sample of pregnant women at The Johns Hopkins Hospital. These dramatic differences suggest that current cigarette smoking may be a useful marker for identifying women who use drugs during their pregnancies. The prevalence of intravenous drug use was approximately three times higher in the cocaine group (34 percent) as compared with the other drug use group (12 percent) ( $p < .007$ ). Rates of HIV-seropositivity were also significantly higher in cocaine-using women (12 percent) than in other drug-using women (0 percent) ( $p < .04$ ). Although no differences were observed between the two groups in the prevalence of sexually transmitted diseases (21.6 percent), these rates showed an approximately nine-fold elevation relative to population base rates for this geographic area.<sup>58</sup>

There were no differences across the two groups in the proportion of women who obtained prenatal care during the current pregnancy; approximately 75 percent of the women in both groups registered for obstetrical care before the twenty-eighth week of pregnancy. In both drug-use groups, approximately 40 percent of the women provided positive drug urinalysis screens at labor and delivery. There were two interesting obstetrical outcomes that did not achieve statistical significance (due, in part, to the relatively small sample size examined to date), but are in line with above referenced reports of cocaine effects during pregnancy. First, infants born to cocaine-using women tended to have a lower mean birthweight than infants born to other drug-using women.

**Table. Demographic, Substance Abuse, Psychosocial and Obstetrical Characteristics of Cocaine and Other Drug-abusing Pregnant Patients.**

	Cocaine	Other Drugs	p
Age (yrs)	25.2	25.5	ns
Education (yrs of school)	10.7	11.2	.07
Race (% black)	88	94	ns
Marital status (% single)	82	83	ns
ASI Interviewer Severity Ratings:*			
Drug use	5.1	3.6	.0005
Alcohol use	2.0	2.0	ns
Medical status	4.0	2.3	.005
Employment status	3.3	1.9	.01
Legal status	0.6	0.1	.07
Psychiatric status	1.2	0.3	.05
Family status	2.4	2.2	ns
Obstetrical Outcome:			
Birthweight (gms)	2,800	2,960	.12
Abruptio placenta (%)	29	13	.13

\*ASI Interviewer Severity Ratings range from 0-9, with 0 being no treatment necessary and 9 being extreme need for treatment.

Also, there tended to be a higher incidence of abruption for cocaine-using as compared with other drug-using women.

### Effects of a Prenatal Support Group on Pregnancy Outcome

Because of the high prevalence of cocaine and other drug use in the OB clinic, substance abuse support services were introduced in the clinic in April 1989 and are still continuing. Several strategies have been employed to improve prenatal care compliance and reduce substance use by prenatal patients identified with substance abuse problems. Women identified with substance abuse problems are assigned to attend the OB clinic during a special high-risk OB session held once each week. A substance abuse specialist facilitates this weekly one-and-a-half hour support group. The group functions primarily as a peer support group in which the women share their experiences, concerns, and successful strategies for reducing their drug use during pregnancy. The specialist is present to encourage interaction and to provide information when questions arise. As an added incentive, patients are provided with lunch and transportation costs. Women are allowed to bring non-school-aged children so that the absence of childcare is not an impediment to treatment participation.

We have recently conducted a preliminary analysis of several obstetrical outcome measures as a function of patient attendance at the support group. Attenders and non-attenders were comparable in demographic characteristics and in the severity of their drug and alcohol problems.

Overall, group attendance was found to impact positively on pregnancy outcome. Since low birthweight represents the second leading cause of death in US infants, we were particularly interested in impact on infant birthweight. As shown in the Figure, group attendance was found to correlate positively with birthweight ( $p < .008$ ), such that more frequent group attenders were found to give birth to higher weight infants. We are currently examining other important obstetri-

cal outcome measures such as gestational age, Apgar scores, and birth complications.

### Summary

Clearly, drug use during pregnancy has become quite widespread with well-documented direct and indirect negative consequences for women and their offspring. Effects include reduced birthweight, birth complications, neonatal drug withdrawal, poor nutrition, increased risk of serious infection, and unstable lifestyles. There are a number of steps that physicians in both public and private settings must take to address this important public health issue including screening, intervention, treatment referral, and follow-up.

Cocaine use by pregnant women using our clinic has increased dramatically in recent years. Cocaine-using women have been found to have a wider range of psychosocial and medical problems as well as generally poorer obstetrical outcomes than women who use other drugs during their pregnancies. Clearly all drug-using women are in need of prompt and ongoing intervention, particularly during their pregnancies. Findings from our ongoing OB support group suggest that even a once weekly peer-oriented intervention can significantly impact on pregnancy outcome for drug-using women. This intervention model appears to offer a low-cost, easy to implement strategy that can be developed in a variety of health care settings.

# QUALITY

## THE HOPKINS TRADITION

# **We pay attention to every detail.**

With today's advanced medical technology, we're able to produce diagnostic images of remarkable complexity, clarity and detail. Which is why our head and body MRI imaging services are so valuable to you and your patients.

Magnetic Imaging of Baltimore's (MIB) dedicated radiologists and staff provide your patients with the care and experience you expect. We are able to schedule your patients within 24 hours of their request at our convenient location on the campus of Greater Baltimore Medical Center.

At Magnetic Imaging of Baltimore, we realize what a difference the details can make. So take a closer look. You might discover something your patients should know about.

# Premenstrual Syndrome Update: 1991\*

---

Ivan A. Backerman MD, FACOG

---

*Dr. Backerman is President of the Atlanta Obstetrical and Gynecological Society and is a Clinical Instructor in the Department of Obstetrics - Gynecology, Emory University School of Medicine, Atlanta, GA.*

**T**he premenstrual syndrome (PMS) may be defined as the cyclic recurrence, during the luteal phase of the menstrual cycle, of a combination of physical and psychological and/or behavioral changes of enough severity to deteriorate interpersonal relationships or interfere with normal activities. Although exact incidence figures are not available, PMS is a common and important problem in many countries of the world. Its importance lies not only in the discomforting physical and mood symptoms with which it is associated, but in the way it interferes with an affected woman's home life, disturbs her family, and lowers her self-esteem. The condition was first defined as a syndrome in 1931 by Robert T. Frank MD, an American gynecologist.<sup>1</sup> His information about PMS did not gain widespread recognition at the time, probably because the publication in which it appeared, *Archives of Neurology and Psychiatry*, usually was not read by members of the general medical profession.

Dr. Frank stated,

the group of women to whom I refer especially complain of a feeling of indescribable tension, from ten to seven days preceding menstruation, which in most instances continues until a time that the menstrual flow occurs. The patients complain of unrest, irritability, feeling like jumping out of their skin, and a desire to find relief by foolish and ill-considered actions. Their personal suffering is intense and it manifests itself in many reckless, and sometimes reprehensible, actions. Not only do they realize their own suffering but they feel conscience stricken toward their husbands and families, knowing well that they are unbearable in their attitudes and their reactions. Within an hour or two after the onset of the menstrual flow complete relief from both physical and mental tension occurs.

In 1934, the late gynecologist, S. Leon Israel MD,<sup>2</sup> was the first person to propose that this syndrome was possibly caused by defective luteinization resulting in a progesterone deficiency and a relative hyper-estrogenic

---

---

*Premenstrual syndrome (PMS) was first identified in 1931 and currently affects millions of women on a physical and emotional basis. However, Buspirone has been found to be a safe and markedly effective agent in the management of this condition.*

---

state in the female patient. It became common practice to treat PMS with progesterone. (However, the idea of relieving all PMS symptoms with progesterone supplementation has been shown to be no more effective than that of placebo therapy.) In 1953, the eminent English clinician, Katherine Dalton, proposed the term premenstrual syndrome.<sup>3</sup> She was the first individual to coin the name and the phrase, PMS. As a result of the women's movement in 1982, people became interested in PMS, a condition that might trouble millions of women (and allegedly had never been given its due by male dominated science and medicine) and a treatment that might give relief but had been ignored and suppressed by the medical establishment. According to Dr. Leon Speroff,<sup>4</sup> "In 1982, PMS became a national industry." The approach to the treatment of PMS became nearly as difficult as establishing hard scientific criteria as to who had PMS and who had neurotic behavior associated with some other organic disorder. The symptoms of PMS are divided into physical and psychological. With some variations, the patients generally conform to Dr. Frank's definition.

Physical symptoms of PMS (Tables 1 and 2) are represented by generalized aches and pains or malaise, headaches, chest pain, breast pain and tenderness (mastalgia), nipple tenderness, backache, and a great deal of abdominal discomfort and pain. The general abdominal symptoms of PMS include dizziness, bloating, discomfort, diarrhea, fullness or cramps, constipation, thirst, craving for sugar and/or salt, increased or decreased urination, and increased or decreased appetite. Many of these symptoms are also seen in the first trimester of pregnancy as a pronounced response to progesterone.

Before making a diagnosis of PMS, patients who are seen with extreme thirst, craving for sugar, increased urination, and decreased appetite should undergo a glucose tolerance test. It should be noted, however, that although the symptomatology may mimic that of diabetes, there is no particular relationship between diabetes and PMS.

Mood Changes

PMS has been described as a significant disorder of mood

Table 1. Physical Symptoms of PMS

- |                               |                                 |
|-------------------------------|---------------------------------|
| • Generalized aches and pains | • Breast pain and tenderness    |
| • Headache                    | • Abdominal discomfort and pain |
| • Chest pain                  | • Backache                      |

Table 2. General Abdominal Symptoms of PMS

- |                      |                                    |
|----------------------|------------------------------------|
| • Bloating           | • Diarrhea                         |
| • Discomfort         | • Constipation                     |
| • Fullness or cramps | • Increased or decreased urination |
| • Thirst             | • Increased or decreased appetite  |
| • Craving            |                                    |
| • Dizziness          |                                    |

(Table 3). Many individuals have thought that the patient with typical PMS represents a depressed state. As with many other mood changes, some of the patients with PMS may have depression. For the most part, it has been my clinical experience that PMS patients exhibit a great deal of anxiety, a great deal of hostility, and an inability to cope characterized by the inability to concentrate, as well as general inefficiency and indecisiveness. The PMS patient basically has low self-esteem and does not like herself. She feels a sense of unattractiveness, a great deal of dissatisfaction with everything, and a good bit of tension. These patients may also experience withdrawal, confusion, excitation, aggression, irritability, some sadness, decreased sexual feeling, absence of libido, and insomnia. The negative effects of mood in the PMS patient usually occur during the late luteal phase of the menstrual cycle or seven to ten days prior to the onset of menstrual flow.

Diagnosing PMS

Clinical guidelines can assist in the process of diagnosis for PMS (Table 4). When diagnosing PMS, the clinician should look initially for the mood and physical symptomatology to consistently recur during the premenstrual phase of the patient's menstrual cycle. Second, and of great importance, the symptom severity must be sufficient to affect a woman's daily life. If the symptomatology does not affect the patient's daily life in an adverse manner and cause great difficulty in her ability to function in the work place or at home, then these patients should be excluded from the strict diagnosis of PMS. Patients who have menstrual irritability and have some symptomatology during the late luteal phase do not necessarily have PMS. The symptomatology onset must be close to the middle of the menstrual cycle and should completely disappear at the time of the menstrual flow. There should be an interval during the first half of the menstrual cycle when the patient feels pretty much her normal self. Last, there should be an absence of other physical symptoms, physical illness, or organic disorders that could explain some of the symptomatology. For example, it would be important to rule out pelvic inflammatory disease, low grade chlamydial infection, endometriosis, adenomyosis, brain tumor, or a major psychiatric disorder.

Table 3. Negative Effects of PMS on General Mood

- |                                   |                            |
|-----------------------------------|----------------------------|
| • Inability to concentrate        | • Tension                  |
| • General inefficiency            | • Withdrawal               |
| • Indecisiveness                  | • Confusion                |
| • Slowness                        | • Excitation               |
| • Disinterest in people           | • Aggression               |
| • Sense of unattractiveness       | • Irritability             |
| • Dissatisfaction with everything | • Sadness                  |
| • Fatigue                         | • Decreased sexual feeling |
|                                   | • Difficulty sleeping      |

It is extremely important to establish that the patients being classified as having PMS actually have a difference in their behavior and emotional patterns during the menstrual flow as opposed to the late luteal phase of their menstrual cycle. This can be accomplished with a good clinical history and simple psychometric testing like the Hamilton A Anxiety Rating scale or the Hamilton D Depression Rating scale, or perhaps with even more complex psychometrics such as the Minnesota Multiphasic Personality Inventory (MMPI).

It is not infrequent to evaluate these patients by giving them psychometric testing twice, once during the late luteal phase and once during menses. It is amazing that the typical PMS patient behaves in a very normal manner, has a normal affect, has normal behavior, has no anxiety, and can be classified as a relatively normal individual during her period. Whereas during the last luteal phase, she may exhibit bizarre behavior and a very different pattern including aggression, hostility, a great deal of mixed emotional conflict, and an inability to cope.

It is important to separate patients diagnosed as having PMS from patients who might have some organic illness which could mimic the physical symptoms and eventually create a certain degree of mood change and anxiety as well as from patients who have psychiatric disorders of a significant nature. Patients with psychiatric disorders test abnormally on the MMPI at anytime during the month. Even though it is well-known that some patients with major psychiatric disorders can have some increased intensity of symptoms during the late luteal phase, they are pretty much psychiatrically disturbed during the entire month; it makes no significant difference whether they are tested during the beginning of their cycle or during the late luteal phase. In 20 to 30 percent of institutionalized psychiatric patients, there is an increase in the need for medication during the late luteal phase of the cycle. So, it is not uncommon to see that the late luteal phase of the menstrual cycle may aggravate emotional disorders in general, and anxiety especially, but it is not the same as the patient with PMS who is essentially normal and who has no behavioral problems and no symptoms attributable to a psychiatric problem except during the late luteal phase.

**Table 4. Clinical Guidelines for Diagnosis of PMS**

When diagnosing PMS, the clinician should look for:

- Mood and physical symptoms consistently recurring during the premenstrual phase of the menstrual cycle.
- Symptom severity sufficient to affect a woman's daily life.
- Symptom onset close to middle of menstrual cycle, abating at time of menstruation.
- An interval when a woman feels pretty much her normal self during the first half of the menstrual cycle.
- Absence of other illnesses which would completely explain the symptoms.

Recently, the National Institute for Mental Health and the National Institute for Children's Health and Human Development (NICHD) worked together in trying to establish severe PMS as a separate disorder classifiable in the *Diagnostic and Statistical Manual of Mental Disorders*, Third Edition (*DSM-III-R*) as a codeable psychiatric entity referred to as Late Luteal Phase Dysphoric Disorder. The latest issue of the *DSM-III-R* lists Late Luteal Phase Dysphoric Disorder in the appendix but it has not reached the level of a codeable diagnosis.

As a gynecologist interested in primary care in women, I do not believe it is necessary to add a new name and give it a new designation. Severe PMS is still, in my opinion, not classifiable as a psychiatric disorder.

**Assessing Patients for PMS**

Assessing patients for PMS is an ongoing process (Table 5). It should be carried out during at least a ninety-day period of time or through three menstrual cycles. It is best that no medication be given during the assessment. The patient should be instructed to keep a daily symptom diary, which should be reviewed with the patient at four-week intervals. The most important thing physicians can do during this ninety-day assessment period is to assure the patient that what is wrong with them is a *real* condition and that it is something that can be treated successfully.

During this time, it is also appropriate to perform basic psychometric testing. For those patients who cannot afford extensive psychometric testing with the MMPI or who are unwilling to go through extensive testing, and for patients who live where the MMPI is not readily available, I recommend the Hamilton Anxiety Rating scale (Table 6). The scale is a simple rating of zero through four and is easy enough to use as a simple checklist. It only takes a few minutes to rate these patients during the menstrual flow period as well as during the late luteal phase of the menstrual cycle and see the *marked* difference in the patient's score.

During the evaluation period, the patient should be encouraged to change her diet, to change her activity level (exercise), and to participate in self-help or coping sessions. Dietary changes should include an increase in green vegetables, an increase in carbohydrates, and avoidance of salt, red meat, caffeine, high cholesterol foods, and alcohol.

In addition to changing the physical aspects of the patient's life, it is important to help her with self-coping. This would best remedy itself if there existed self-help organizations for

**Table 5. Assessing for PMS**

- Ongoing process
- Vital initial phase of therapy
- No medication to be given during assessment
- Evaluate for two to three cycles:
  - Instruct patient to keep daily symptom diary
  - Review diary with patient
  - Correlate diary with life events

coping with PMS. However, at this time, few, if any, exist. Patients must be forced out of their rut, removed from their withdrawn state, and encouraged to participate in life and change some of their bad life patterns. I encourage them, if they have the desire, to go back to school, and to get involved with their church, re-establish old friendships, make new friendships, find hobbies, and raise their self-esteem by changing the way they dress and wear their hair and make-up.

The significance of the first ninety days without medication, the relationship between the patient and the physician, and the changing of the patient's lifestyle and ability to cope, represent a significant move forward in therapy resulting in a 30 percent remission rate. This 30 percent remission in PMS patients has been described as the "placebo-response."<sup>5</sup>

### Biological Theories

To date, there is no firm evidence to substantiate any one biological theory for the etiology of PMS.<sup>6</sup> The theories include low estrogen levels, high estrogen levels, falling estrogen levels, changes in the estrogen/progesterone ratios, increased aldosterone activity, increased renin-angiotensin activity, increased adrenal activity, endogenous endorphin withdrawal, subclinical hypoglycemia, central changes in the catecholamines, response to prostaglandins, vitamin deficiencies, and excess prolactin.

Because of the lack of theory validation, many of the treatments that have been used in the past such as progesterone supplementation with suppositories or with intramuscular injections or micronized progesterone, have been shown to produce no more than a 20 percent beneficial response. Drs. Freeman, Rickels, Sondheim and Polansky<sup>7</sup> recently demonstrated that progesterone vaginal suppositories are not only ineffective in the treatment of PMS but less than 20 percent of patients gain any benefit and, for the most part, progesterone may actually aggravate PMS. The NICHD also reported that patients who used progesterone had, as a result, a definite aggravation of their PMS except in that small group of approximately 20 percent who seem to respond to almost any type of therapy.

### Medications

Many medications have been used in the treatment of PMS with no better than a 20 percent response including bromocriptine, danazol, vitamin B<sub>6</sub> (pyridoxine), clonidine, beta blockers, the LNRH agonist, and the GNRH agonist. Many of these also produce symptoms of their own which may be undesirable. Other medications that have been used with a good bit of success for the physical symptoms of PMS and, occasionally, the tension and irritability associated with PMS, are the prostaglandin synthetase inhibitors also known as the non-steroidal anti-inflammatory drugs. Some extensive studies have shown that mefenamic acid (Pomstel) is better than a placebo and, recently, naproxen sodium

**Table 6. Hamilton Anxiety Rating Scale\***

0=None, 1=Mild, 2=Moderate, 3=Severe, 4=Very severe, incapacitating

Item	Ratings
<b>Anxious Mood</b>	
Worries, anticipation of the worst, fearful anticipation, irritability	
<b>Tension</b>	
Feelings of tension, fatigability, startle response, moved to tears easily, trembling, feelings of restlessness, inability to relax	
<b>Fear</b>	
Of dark, of strangers, of being left alone, of animals, of traffic, of crowds	
<b>Insomnia</b>	
Difficulty in falling asleep, broken sleep, unsatisfying sleep and fatigue on waking, dreams, nightmares, night terrors	
<b>Intellectual (Cognitive)</b>	
Difficulty in concentration, poor memory	
<b>Depressed Mood</b>	
Loss of interest, lack of pleasure in hobbies, depression, early waking, diurnal swing	
<b>Behavior at Interview</b>	
Fidgeting, restlessness or pacing, tremor of hands, furrowed brow, strained face, sighing or rapid respiration, facial pallor, swallowing, belching, brisk tendon jerks, dilated pupils, exophthalmos	
<b>Somatic (Sensory)</b>	
Tinnitus, blurring of vision, hot and cold flushes, feelings of weakness, picking sensation	
<b>Cardiovascular Symptoms</b>	
Tachycardia, palpitation, pain in chest, throbbing of vessels, fainting feelings, missing beat	
<b>Gastrointestinal Symptoms</b>	
Difficulty in swallowing, wind, abdominal pain, burning sensations, abdominal fullness, nausea, vomiting, borborygmi, looseness of bowels, loss of weight, constipation	
<b>Respiratory Symptoms</b>	
Pressure or constriction in chest, choking feelings, sighing, dyspnea	
<b>Genitourinary Symptoms</b>	
Frequency of micturition, urgency of micturition, amenorrhea, menorrhagia, development of frigidity, premature ejaculation, loss of libido, impotence	
<b>Autonomic Symptoms</b>	
Dry mouth, flushing, pallor, tendency to sweat, giddiness, tension headache, raising of hair	
<b>Somatic (Muscular)</b>	
Pains and aches, twitchings, stiffness, myoclonic jerks, grinding of teeth, unsteady voice, increased muscular tone	

\*Hamilton M. The Assessment of Anxiety States by Rating. *Br J Med Psychol* 1959; 32:50-5.

(Anaprox double strength) has been used as an effective prostaglandin blocking agent. It should be pointed out that no matter which non-steroidal anti-inflammatory drug is used, there is a good response to the physical symptomatology but that none of the prostaglandin blocking agents have a significant effect in the treatment of the patient's mood and emotional symptomatology.

I have had some excellent results in young patients willing to use low-dose, combined oral contraceptive pills for controlling their menstrual cycle and obliterating the late luteal phase. My findings have been that a combination of mild diuretics (preferably of the spironolactone type), a low-dose combined (monophasic) oral contraceptive pill, and a prostaglandin blocking agent has produced a 60 to 70 percent beneficial effect in physical and emotional symptomatology.

It should be pointed out that PMS is seen in each decade of life until approximately age fifty. It is characteristic of PMS that the severity increases with each decade of life so that patients who have PMS in their twenties have a much worse time with PMS in their thirties and an even worse time in their forties. The worst PMS seems to occur in patients between thirty-eight and forty-four. PMS completely stops with the onset of menopause, but can reoccur in patients who are put on estrogen replacement therapy and progesterone supplementation to prevent endometrial carcinoma in the non-hysterectomized post-menopausal woman.

Regarding the etiology and mechanism of PMS, it is generally believed, but not conclusively documented, that PMS may well be the result of a hypersensitivity in the serotonin 1A receptors in the cortex of the brain enhanced by the late luteal phase of the menstrual cycle. Based on work recently published, and based on personal experience, I believe that progesterone may well be the aggravating factor in the late luteal phase that triggers this hypersensitivity at the serotonin 1A receptor in the brain; therefore, to successfully treat PMS, it is imperative to treat PMS physically and also treat the anxiety aspects and the behavioral aspects from a neuropharmacologic point of view.

The drugs (Table 7) used classically in anxiety treatment included alcohol, opiates, belladonna, bromides, and barbiturates, followed by meprobamate and then the phenothiazines. Today, phenothiazines are still being given to institutionalized psychiatric patients. Most physicians are rather leery of using the phenothiazine drugs because of extrapyramidal tract convulsions and also because in significant therapeutic doses, phenothiazines may produce extreme sedation and an inability to function in a normal manner. The antihistamines such as Phenergan, Vistaril, and Benadryl have been used because of their sedative effects, but these are not safe for the treatment of anxiety in an ambulatory patient. The benzodiazepines began with Chlordiazepoxide or Librium then Diazepam or Valium and on through a host of combinations of various types of benzodiazepines that have evolved into the latest and shortest-acting benzodiazepine known as alprazolam or Xanax. Alprazolam has

been studied extensively in the management of PMS with excellent results in the management of anxiety.

In my experience, giving PMS patients alprazolam for seven to ten days in small doses has been extremely beneficial in the management of the patient's anxiety. However, giving this highly euphorogenic substance to PMS patients who may have addictive-type personalities results in the failure to comply (they may take the medication every day). The patient would rather take the medication over a longer period of time and continue to increase her dose because of the euphoria that is accompanied by benzodiazepines. Again, my clinical experience and that of others has been that the use of the benzodiazepines in the treatment of anxiety is most effective in short-term use. For persistent or sustained anxiety, the continued use of the benzodiazepines may result in increased dosage and addiction. The side effects of the benzodiazepines are impairment of psychomotor function and coordination and, in many cases, the inability to drive a motor vehicle, function in the work place, and function at home. Thus, we may have a medication which is excellent for the anxiety of PMS but once again places the PMS patient in a position of being unable to function properly. And, as was originally stated in the guidelines for diagnosing PMS, we do not want to substitute a patient who cannot function in the work place because of PMS for a patient who cannot function in the work place because of her medication.

Tricyclic, one of the classic antidepressants, has had very little benefit in patients with PMS. The newest antidepressant, fluoxetine, has been used extensively for people with depression. I believe there are certain problems in the chronic use of this medication in patients with PMS. One of the neuropharmacologic disadvantages of the use of fluoxetine is the increase in serotonergic activity. I believe that anxiety is generally a serotonergic effect and that patients who are taking this medication for any prolonged length of time have a marked increase in serotonin activity and a marked increase in anxiety.

My patients who have PMS and have used fluoxetine have had an initial beneficial effect for several days and then have had a tremendous amount of anxiety. The patients have had to take some type of tranquilizer to come down from the anxiety effects of increased serotonin in the cortex.

The beta blockers have been used extensively and with no better effect in PMS than 20 percent or less.

Azapirones

## Buspirone

This brings us to an entirely new class of medications, the azapirones.<sup>8,9</sup> The azapirones are a new generation of serotonergic anxiolytics that are an entirely different group of chemical compounds. The azapirones act primarily as a serotonin 1A receptor agonist in the pre-synaptic neurons and a partial agonist in the post-synaptic neurons. Buspirone<sup>10-11</sup> or Buspar is the only azapirone available for prescription writing. The second generation azapirone, Gepirone, is in phase three studies and should be available in the future.

Buspirone is not a controlled substance. It is not a habit-forming drug, and there is no abuse potential. There is also no withdrawal symptomatology on abrupt cessation and there is no euphoria. Buspirone is not a tranquilizer; it does not cause sedation or any effects on psychomotor coordination.

It is important to place the azapirones in a separate category from the drugs commonly called tranquilizers. Tranquilizers are sedatives. They produce euphoria, are usually addicting, and may cause withdrawal convulsions.

There are major differences between the benzodiazepines and Buspirone (Table 8). Both Buspirone and the benzodiazepines are quite effective in the management of anxiety. On the other hand, the benzodiazepines have anticonvulsant effects, are sedatives, are muscle relaxants, may cause functional impairments, interact with the central nervous system depressants, and may cause abuse and physical dependence problems. However, with Buspirone, only the positive effects on anti-aggression, conflict, and conditioned avoidance are seen.

In a study on the use of Buspirone in PMS patients by Daniel David and his coworkers from the University of East Tennessee,<sup>12</sup> patients with mild PMS showed an 80 percent helpful response, patients with moderate PMS showed a 92 percent helpful response, and patients with marked PMS showed a 100 percent helpful response. All patients who responded had been on tranquilizers previously. When questioned, they indicated they were more willing to accept Buspirone than they were their previous tranquilizers, apparently because it affected their PMS positively without any of the side effects usually associated with other types of tranquilizers.

What I find most interesting about Dr. David's study is that the more severe the PMS was, the better the response to Buspirone. This experience parallels my own clinical experience with the use of Buspirone in PMS.

PMS patients whom I have managed with Buspirone have been treated with a large prescription of ten milligram tablets with a dosing protocol of one-half of one ten milligram tablet three times daily for the first four days followed by one full tablet three times daily beginning with the first day of the menstrual cycle and continuing throughout the entire cycle for at least three menstrual cycles. When I have treated patients with thirty milligrams of Buspirone daily for ninety days, I have obtained a 96 percent success rate in severe PMS.

Following this, other treatment options are: to take the patient off Buspirone to see if it has effected a remission; to reduce the dose of Buspirone to twenty milligrams per day; or to cycle the patient using Buspirone beginning on the seventh or eighth day of the menstrual cycle and continuing the Buspirone until the onset of the menstrual flow. My patients enjoy being cycled with Buspirone because they feel they are having a cyclic problem and they are more comfortable with cyclic therapy. It has been my experience over the past few years that the results in the treatment of PMS with Buspirone are excellent with cyclic therapy and approximately 2 to 4 percent better with continuous therapy. Buspirone is not an as needed (PRN) medication. It takes at least seven days to effect a significant level in the cortex to alleviate anxiety. There is a lead time which must be followed in order to get the maximum beneficial effect of the proper level of Buspirone in the cortex to block the serotonin 1A receptors.

Buspirone can be compared favorably with any of the benzodiazepines; it takes just as long for even the short-acting benzodiazepines to alleviate anxiety as it does Buspirone. The difference is that when giving a benzodiazepine, we obtain sedation for the anxious or hysterical patient, but the patient also develops euphoria which masks the patient's actual state of anxiety.

Buspirone contributes no euphoria and no sedation. The advantage of the use of Buspirone over any of the benzodiazepines is that it does not cause addiction. It should also be noted that neuropharmacologically, Buspirone does not effect the GABA receptors, does not affect other parts of the brain, and produces no incoordination or psychomotor disturbances. Buspirone does not elevate the mood of the patient by producing euphoria but instead "normalizes" the serotonergic state that we see in the patient with PMS, resulting in a positive change in the patient's feeling without a complete change in the patient's personality.

One of the distinct advantages of Buspirone is that there is no synergistic relationship between buspirone and other medications classically used in preoperative, postoperative or operative patients. Also, patients who are doing well with PMS can return to social drinking while taking Buspirone; there is no increase in the effect of alcohol as there is with the use of typical tranquilizer medications.

Table 8. Buspirone: Anxioreselective Profile<sup>13</sup>

	Buspirone	Benzodiazepines
Antiaggression	+	+
Conflict	+	+
Conditioned avoidance	+	+
Anticonvulsant	-	+
Sedation	-	+
Muscle relaxation	-	+
Functional impairment	-	+
Interaction with central nervous system depressants	-	+
Abuse potential/physical dependence	-	+

## Summary

I have outlined the history of PMS and its physical and emotional symptoms. I have presented guidelines for diagnosing PMS, and shown how to assess the PMS patient. I have discussed how the physical aspects of PMS can be dealt with using diuretics and prostaglandin blocking agents. I have reviewed a new theory for the etiology of PMS. I have discussed the use of the new class of serotonergic anxiolytics referred to as azapirones and the only azapirone available for prescription use, Buspirone. I have demonstrated the significance of the use of Buspirone in patients with PMS. I have outlined the mechanism of action of Buspirone on the serotonin 1A receptors in the brain as an agonist in the pre-synaptic neurons and as a partial agonist in the post-synaptic neurons. I have discussed the superiority of the use of Buspirone for anxiety and PMS over benzodiazepines as that of lack of abuse and lack of addiction. The characteristics of Buspirone are that it is a non-controlled substance not regulated by the drug enforcement agency, it is safe, and it has been markedly effective in the management of my patients with PMS.

## DON'T YOU WISH THESE DEFENSE LAWYERS WERE YOURS?

This big, multistate firm rarely loses a case. But it's more than luck, or even legal skill, that's behind its enviable record.

By Howard Eisenberg

**S**uccessfully defending a brain-damaged baby case is the courtroom equivalent of pitching a no-hitter. Because the "sympathy factor" can add millions to a jury's award, many insurance carriers would rather settle than fight.

Not so the P-I-E Mutual Insurance Co. of Cleveland, Ohio, and the 1-year-old law firm—Jacobson, Maynard, Tuschman & Kalur—that does all its defense work. In 21 brain-damaged baby cases it has defended for the doctor-owned company, its record is a remarkable 19-1-1, the last a hung jury. In 1988, its over-all scorecard read 33 wins, 5 losses—all malpractice cases.

There's more to those numbers than luck "the even legal skill," adds JMT&K founding partner Aaron Jacobson, who was one of Ohio's leading plaintiffs' lawyers before he, Larry E. Rogers, Herbert S. Bell, M.D., and 70 other Cleveland doctors formed P-I-E in 1975.

"It's the concept behind the firm that makes it work. Physicians specially panels review every lawsuit to decide whether the defendant deviated significantly from the standard of care. If he did, we pay. If he didn't, we defend. Makes no difference whether it's a \$5,000 or a \$5 million case. We label it 'No pay.' That policy has resulted in a lot of cases being dropped. Perhaps more important, it's

discouraged the filing of many other cases. Plaintiffs' attorneys have learned that we're fair negotiators when our doctor's in the wrong, but won't back down when he's right."

That approach pays off. "According to the most recent report I've seen from the General Accounting Office," says Larry Rogers, P-I-E president and CEO, "in 1984, about 55 percent of medical-malpractice claims were closed without payment."

Through 1988, we've closed an average of 78 percent of our cases without a dime changing hands. And it's my understanding that, without including defense costs, St. Paul Fire and Marine Insurance Co.'s 1988 average gross payout for cases closed in Ohio with payment was \$52,500. Our comparable figure was about \$10,000 below

theirs. That's partly why we can sell an ORG specialist in Ohio—an industrial state that ranks among the most litigious—\$1.2 million in coverage for just \$26,400."

The unique marriage of P-I-E and JMT&K has been so successful that the carrier has expanded into five other states: Indiana, Kentucky, Maryland, Missouri, and West Virginia. Where P-I-E goes, there goes JMT&K, with nine branch offices to date. The firm has 60 trial attorneys, and may well be the nation's largest devoted well-nigh exclusively to medical-malpractice defense.

Could the insurer-defender symbiosis, if duplicated by other doctor companies, make a significant contribution to reducing malpractice litigation nationwide? An up-close look at

how JMT&K operates may help to answer that question.

### Every lawyer develops a medical specialty

"Our firm's lawyers read more medical books than law books," says P-I-E Vice President Gerard C. O'genorth, himself a veteran defense attorney. Robert Maynard explains, "New cases are discussed at our weekly staff meeting, so that every lawyer is familiar with every case. But we assign cases to our attorneys according to medical specialty. They're well-versed in their fields, so they don't have to relearn the wheel with each case." Last year, the firm's ORG specialist, attorney Jerome S. Kalur, who had won 16 consecutive brain-damaged baby cases, faced one of his toughest challenges when he defended a GP

who'd attempted a midforceps delivery that ended in a Cesarean section and a severely brain-injured baby. Recalls Kalur, "I didn't think the doctor had caused the damage, but our position was weakened by the fact that he didn't have midforceps privileges. Based on that departure from the standard of care, our doctor panel voted to settle, and, since the hospital was also involved, a combined sum of \$1.5 million was offered. Plaintiffs turned us down flat."

"I wanted to depose the doctor, who'd been involved in the mother's care during her hospitalization, but the attorney for the plaintiff baby insisted it would violate the mother's physician-patient confidentiality. That privilege would terminate automatically when her medical

The winning firm's four founders at Cleveland's 8th District Court of Appeals (from left): Jerome S. Kalur, Aaron Jacobson, James M. Tuschman, and Robert Maynard.

records were introduced at the trial end of the plaintiff's case. Meanwhile, I was in the no-win position of having to tell the jury, 'It couldn't have been the midforceps,' without offering them another reasonable brain-damage theory."

Fortunately, the plaintiff rested their case on a Friday afternoon, giving JMT&K time for a weekend rally. "Twenty minutes later," says Kalur, "I was in the hospital pathologist's office with an order permitting me to view the mother's placental slides." Microfilm staining had been charted, and Kalur had a hunch that fetal distress had begun long before the fur

**T**hey're seasoned attorneys with an incredible record of success.

Malpractice specialists in every medical specialty.

More than seventy lawyers in eleven offices: they're part of The P-I-E Mutual team ... Jacobson, Maynard, Tuschman & Kalur, a formidable defensive lineup, with an imposing record.

Three-quarters of all claims closed without a penny changing hands.

Ninety percent of the cases that go to trial won.

One of every four doctors will someday face a lawsuit. The P-I-E Mutual helps you face that future without fear. With a claims review committee made up of your peers. And a prepaid law firm that can rally its total resources against any and all claims.

# Leishmaniasis: An Undesirable Import

---

Suzanne Holmes Giannini PhD and Joseph W. Burnett MD

---

*From the University of Maryland School of Medicine where Dr. Giannini is a member of the Department of Microbiology and Immunology and Dr. Burnett is a member of the Department of Medicine.*

---

*The impact of leishmaniasis on public health is often underestimated.*

*Prompt diagnosis and appropriate therapy may minimize the development of serious sequelae.*

---

A patient comes to your Maryland office complaining of a painless, non-healing skin nodule or ulcer. Your differential diagnosis would normally include swimming pool granuloma, carcinoma, lymphoma, blastomycosis (if the lesion is on the face), sporotrichosis (if there is more than one lesion), and possibly lupus erythematosus. But what if this patient has been traveling in the tropics or the Middle East, or is an avid camper, bird watcher or safari goer? Then, consider the possibility of exotically acquired cutaneous leishmaniasis.

## The Disease

A Maryland-educated physician, James Homer Wright (AB, The Johns Hopkins University; MD, University of Maryland), is credited with the first detailed description in 1903 of the protozoan parasite causing cutaneous leishmaniasis.<sup>1</sup> The leishmania live exclusively within histiocytes and macrophages, and cause a wide variety of clinical presentations. The most common is a painless, non-healing nodule or skin ulcer, a granulomatous reaction to *Leishmania*. Excision of the leishmanial granuloma or treatment with steroids may worsen the disease. Delay in diagnosis can be a setback.

All species of *Leishmania* can cause skin lesions, which are by far the most common presentation. In addition, certain species can metastasize from the initial lesion to cause more serious diseases: mucocutaneous leishmaniasis with extensive mutilation of the lips and nasopharynx; diffuse cutaneous leishmaniasis involving large areas of skin; or visceral leishmaniasis, a systemic disease characterized by hepatosplenomegaly, fever, and wasting. In immunocompromised hosts, leishmaniasis may be a fatal opportunistic infection.<sup>2</sup> Identifying the infecting species is critical in deciding whether to treat a skin lesion conservatively or aggressively, especially if the lesion seems to be resolving.

## Incidence

Leishmaniasis is endemic in every continent except Australia and Antarctica. The types of leishmaniasis reported in each country are detailed in a 1984 World Health Organization report.<sup>3</sup> Worldwide, an estimated 400,000 new cases of leishmaniasis occur annually, with a prevalence of 12 million.<sup>4</sup> The areas of endemicity and the number of cases seem to be increasing.

In view of the recent transport of hundreds of thousands of Americans to the Middle East as part of the United Nations action in the Persian Gulf, it is important to note that cutaneous leishmaniasis is highly endemic in Iraq, Kuwait, and Saudi Arabia, including a focus near Riyadh, Saudi Arabia.<sup>5</sup> Indeed, one common name for cutaneous leishmaniasis is "Baghdad boil."

In the United States, 259 cases of leishmaniasis were reported to the Centers for Disease Control (CDC) in Atlanta from 1976 to 1985.<sup>6</sup> Two cases were contracted in an endemic focus in Texas, one was an accidental laboratory infection, and the rest were imported into the United States. Since 1981, cases in the US military are no longer included in the CDC figures. The CDC figures probably underestimate the true number of infections because they are based entirely on physician-initiated requests for the antimonial Pentostam, the approved chemotherapy.

## People Likely to be Infected

Most imported cases occurred in former residents of endemic areas, or in visitors to these areas engaged in military exercises, biological field studies, jungle touring, or missionary work. More than half of the cases were acquired in Central and South America, about one-third in the Middle East, and the remainder in Asia, Africa, and the Mediterranean area.<sup>6</sup>

## Recommendations for Diagnosis and Treatment

A biopsy should be taken from the raised, non-ulcerated border of the lesion where the leishmania replicate. The biopsy specimen should be divided aseptically. Half the specimen should be formalin fixed for pathological examination; the remainder should be cultured at 22° C to obtain the organisms or be placed in sterile saline and refrigerated at 4° C for immediate transport. It is important to identify the species because all of them can cause similar cutaneous

lesions. The Parasitic Disease Branch of the CDC in Atlanta at 404-488-4437 will provide culture medium, consult on pathology, or review slides.

Pentostam, the drug of choice in the United States, is available only from the CDC. From 1976 to 1985, more than 85 percent of patients with cutaneous, mucocutaneous, or visceral leishmaniasis responded to Pentostam therapy of 10 to 20 mg/kg/day for ten to thirty days. Drug failures were associated with increasing age, immunosuppression, and infection in regions endemic for the species *L. braziliensis*. Pentostam is toxic, and side effects were not uncommon.<sup>6</sup>

Amphotericin B is used as a second-line drug. Though not approved for use in the United States, ketoconazole has been used to treat cutaneous leishmaniasis, with variable results. Conservative treatment with topical antibiotics to minimize secondary infections may be appropriate for lesions that are healing, if it can be established that they are caused by non-metastasizing species.

The impact of leishmaniasis on public health is often underestimated. Prompt diagnosis and appropriate therapy may minimize the chances of serious sequelae developing.

## Acknowledgments

Drs. Ralph Brian (Centers for Disease Control, Atlanta, GA), Edmond Goidl (University of Maryland, Baltimore, MD), and Hedy Waskin (Duke University, Chapel Hill, NC) provided much useful information and helpful discussions. ■

# Roget: A Versatile Physician of the Nineteenth Century

---

Joseph M. Miller MD

---

*Dr. Miller is a retired surgeon.*

---

*Peter Mark Roget, best known as the compiler of the *Thesaurus*, was also a physician, inventor, writer, and scientist.*

---

The title, *Thesaurus*, is ingrained in the English language and, although the book is widely known, its versatile author and his multitude of accomplishments are not so well-recognized. When Barrie described Captain Hook in *Peter Pan*, he wrote "The man is not wholly evil--he has a *Thesaurus* in his cabin." Hook was described as sinister, polite, and elegant in diction. Then, as now, the *Thesaurus* was a possession of one who spoke and wrote in a literate manner.

Peter Mark Roget (1779-1869), the compiler of the *Thesaurus*, graduated from Edinburgh in 1798 as a doctor of medicine. During the next six years in Manchester, he not only practiced medicine but gave a course of lectures, mostly in chemistry, which may have contributed to the formation of the Manchester Medical School.<sup>1</sup>

In 1809, Roget moved to London and received his license from the Royal College of Physicians. He aided in establishing the Northern Dispensary where he worked without compensation for eighteen years. His days were more than complete as he successively became a member of the Royal Geological Society, the Royal Astronomical Society, the University of London, the Royal Geographical Society, and the Royal Entomological Society. He also found time during his busy medical practice and teaching career to write at length for the *Encyclopedia Britannica*.<sup>1</sup> He was one of the prime examples of the nineteenth century man of letters.

Fascinated by mathematics, it was natural that he was elected to the Royal Society for inventing a log-log slide rule.<sup>2</sup> His slide rule was used well into the twentieth century when the hand-held microchip computer was developed. Almost 200 years had elapsed between the time of Napier and Briggs and their logarithms and Roget's new slide rule.

Four years after his slide rule invention, he published a learned exposition on the kaleidoscope<sup>3</sup> which had recently been patented. This instrument, familiar now to many children, produced a series of images from two plane mirrors placed at a certain inclination in a tube. Roget prepared an interesting and detailed discussion of the physical properties involved in the construction of triangular kaleidoscopes and recounted the material advantages of the polygonal varieties. Displaying a sound knowledge of

optics and geometry, he further suggested that metallic reflectors would produce more light than glass mirrors and that the illumination might be increased by giving the instrument the form of a truncated pyramid with the aperture for the eye at the smaller end.

An even greater scientific contribution was his report on a serendipitous observation of an event whose interpretation became the basis of the modern motion picture. He recognized the occurrence of a curious optical deception when he chanced to view a rolling carriage wheel through the intervals of a vertical venetian window blind; the presence of horizontal bars did not change the observed illusion. He concluded that the phenomenon occurred because a retinal impression remains for a short period after the light source is removed.<sup>4</sup> If human vision were perfect, the illusion of the moving picture would be impossible. (Early motion pictures were projected at a rate of sixteen frames per second but this speed has been increased to twenty-four per second.) In 1923, the movie industry celebrated the centennial of his remarkable discovery.

Roget's observation was exploited in numerous ways in the manufacture of optical devices which amused children and adults and gave further proof to the underlying principle. The thaumatrope, phenakistoscope, and zoetrope featured the merging of pictures to create the illusion of movement. Subsequently, in 1839, Daguerre reported the earliest known method of photography using a plate sensitized with iodine, developed by mercury vapor, and fixed by a solution of hyposulphite. The kinetoscope emerged from the Edison laboratories in 1872 and then Eastman Kodak began the manufacture of photographic film in 1889. A tremendous industry based on the primary observation of Roget arose later.

Additionally, the function of the stroboscope is based on the same ability of the retina to retain an image for an appreciable time. Use of the instrument permits the study of rapid rotary or reciprocating motion. An object seen at intervals equal to the time of revolution will appear to be stationary. If the speed is slightly greater or slightly less, the image will move forward or backward very slowly. When flashes of light are synchronized with rotation, the eye perceives the machine as standing still. Unwanted motion is thus easily discoverable. The applications in industry are many.

Although Roget retired from the practice of medicine in 1840, he never stopped working. In 1849, when he was seventy, he re-started work on the *Thesaurus* in which he had had a longtime interest. Roget read Latin, German, and Italian well and was more than competent in French, so he was well equipped to further his effort.

In compiling what will remain as his greatest work and perpetual remembrance, Roget only continued a lifelong pattern of organization and was able to bring order into a previously untouched area. He did for words and their meanings what Linnaeus did for botany and zoology and Mendeleev did for chemistry. By careful observation and diligence, each investigator brought a systemic order into his respective discipline.

As early as 1805, Roget began compiling a catalogue of words and phrases for his own convenience. He knew about the *Amata-Kosha* produced by Asmarha Sinha, a Sanskrit grammarian and poet of the fourth century AD, and was also aware of a *Pasgraphie* which had been published in Paris in 1797.

The avocation changed to a full-time position between 1849 and 1852. In 1852, Roget published his book, called a *Thesaurus* or treasury of words, which was conceived and effected with thoughtfulness and precision.

The book was immensely successful, with contemporary words and phrases included in subsequent editions. A second edition appeared in 1852 and a third in 1855. At the time of his death in 1869, twenty-eight editions and printings had been released to the public. His son and grandson expanded the work for another edition which appeared in 1879. The Crowell editions started in 1886 and have continued to the present time. The thirty-fourth issue, titled, *Roget's International Thesaurus*, is in its fourth edition and contains 250,000 words and phrases, many of late appearance.<sup>5</sup>

The book is found in all libraries, both public and private. The writer and the crossword puzzle doer have often found aid in its pages. The mark of success is imitation and a number of similar volumes have entered the book world.

Roget was a good physician and made numerous contributions in the field of scientific investigation. A recounting of his activities stuns the reader by its breadth and depth. He was a careful observer, methodical worker, and clear writer.

# We Need A Doctor In The House

When the Maryland General Assembly convenes in Annapolis for its 1992 session, the Medical and Chirurgical Faculty will be there. Since 1964, Med Chi has staffed the first aid facility operated during the 90-day legislative session. Come join us at the state capitol building, see the laws being made first hand. One doctor a day is all that is needed to care for the public, the legislators, and their staffs. Take advantage of the opportunity to donate something priceless, your time.

Please detach the postcard located at the top of this page, fill it out and mail it. A confirmation card will be sent to you explaining the details. You will be carrying on a tradition established by the medical community for the people of Maryland.

## Doctor of the Day 1992

Note: All Monday dates are evening sessions, beginning at 4:00 p.m. and ending at 9:00 p.m. For more information, call Bernadette LaRue at Med Chi's Legal Department, 301-539-0872 or call toll free in Md. at 1-800-492-1056.

Your time can make a difference.

### American Academy of Ophthalmology: Elimination of Preventable Blindness from Diabetes by the Year 2000

In no field of medicine is continuing medical education of physicians more critical than in the management of diabetes. Twelve million Americans have diabetes mellitus, and the disease knows no medical specialty boundaries. In addition to being a major cause of morbidity from multi-system complications such as renal failure, neuropathy, and cardiovascular disease, diabetes is the leading cause of blindness among working-age Americans. It accounts for at least 12 percent of new cases of blindness every year in the United States. Diabetic retinopathy is often asymptomatic at its most treatable stage, emphasizing the importance of early diagnosis of this retinal complication. New information about diabetes emerges almost monthly as published in some specialty journal, making it mandatory for us to find better ways to keep up with advances in this field -- the stakes are simply too high to do otherwise.

In response to the increasing importance of the overall problem of diabetes and diabetic retinopathy, and the availability of improved treatment regimens defined by published clinical trial results, the American Academy of Ophthalmology (AAO) has embarked on a long-term education project designed to more rapidly translate research findings to medical benefits for the American public.<sup>1</sup> The new project -- "Elimination of Preventable Blindness from Diabetes by the Year 2000" -- or "Diabetes 2000" -- was announced at the AAO's 1989 Annual Meeting.

#### Facts About Diabetic Retinopathy

The majority of diabetic patients have non-insulin-dependent diabetes mellitus (NIDDM, Type II). Usually diagnosed after age forty, Type II diabetic patients may or may not be treated with insulin. Fewer patients have insulin-dependent diabetes mellitus (IDDM, Type I), which is usually diagnosed before age thirty. Type I diabetics experience more frequent and severe ocular complications. After five years, 23 percent of Type I diabetic patients have retinopathy; after ten years, almost 60 percent have retinopathy; and after fifteen years, 80 percent have it. Prolifera-

tive diabetic retinopathy (PDR) -- the most threatening form of retinopathy -- is present in 25 percent of Type I patients after fifteen years and often remains asymptomatic well beyond the optimal stage for treatment.

An estimated 700,000 Americans have proliferative diabetic retinopathy and 500,000 have macular edema. The annual projected incidence of new cases of PDR and macular edema is 65,000 and 75,000, respectively. About 8,000 new cases of blindness a year in the United States are caused by complications from diabetes.

#### What Can Be Done

"Diabetes 2000" provides the means to close the gap between advances in research and changes in treatment patterns. While most physicians are aware of diabetic retinopathy, the AAO's goal now is to focus attention on the importance of early diagnosis and timely treatment of diabetic retinopathy based on the important advances of the last five to ten years. For example, we now know that timely laser photocoagulation surgery can reduce the risk of visual loss from proliferative diabetic retinopathy by at least 50 percent. We know that timely laser photocoagulation surgery of diabetic macular edema can reduce the risk of moderate visual loss by 50 percent. We know that vitrectomy surgery can restore useful vision to some diabetic patients who have advanced diabetic retinopathy.

#### Effective Partnerships are Needed

As the working title implies, "Diabetes 2000" will be a long-term project aimed at a specific disease: diabetic retinopathy and its complications. Several phases are anticipated. Providing the latest research findings to ophthalmologists and other physicians who care for those patients is the first priority, followed by patient and public information. Initially, new advances and treatment guidelines for the medical and surgical treatment of diabetic eye disease will be emphasized through continuing education of

### Commentary: "Diabetes 2000"

In this issue of the *Maryland Medical Journal*, the Maryland Society of Eye Physicians and Surgeons and the American Academy of Ophthalmology announce the implementation of their ambitious project, "Diabetes 2000," aimed at eliminating preventable blindness from diabetes by the year 2000. They note 8,000 new cases of blindness a year in the United States from diabetic retinopathy, despite recent advances in treatment. The program will be phased in, with educational programs for ophthalmologists and others active in the management of diabetic patients, followed by additional educational projects directed toward patients and the public.

Maryland physicians have played important roles in ad-

vances in diabetic retinopathy treatment. Dr. Arnall Patz, Chairperson of the "Diabetes 2000" Project and Past Chairman of the Wilmer Ophthalmological Institute, was a pioneer in the development of laser delivery systems for the eye, and did early investigative work on treatment of retinal vascular abnormalities. Ophthalmologists at Johns Hopkins and the University of Maryland served as coordinators and principal investigators in national collaborative studies which determined the efficacy and indications for treatment of proliferative diabetic retinopathy and diabetic macular edema. Dr. Alfred Sommer, Dean of The Johns Hopkins School of Hygiene and Public Health (assisted by Dr. Andrew Schachat,

ophthalmologists, other physicians, allied health professionals, residents, medical students, and specialists in diabetes-related education. In later phases, educational programs for diabetic patients and the public will be developed.

Ultimately, improved eye care of diabetic patients is expected as a result of closer collaboration between the physician primarily responsible for the care of the patient's systemic illness, the patient, and the ophthalmologist. Since diabetic patients can be asymptomatic despite significant progression of diabetic retinopathy, the importance of a renewed and improved partnership between the ophthalmologist and the patient's primary physician is critical.

Because of the ambitious goal and long timeframe, many other medical organizations and public groups are involved in "Diabetes 2000." Representatives from various medical specialties, government agencies, and other organizations devoted to problems of the diabetic patient have been invited to participate. Since diabetes is a complex, multi-system disease, whose overall management is the responsibility of physicians other than ophthalmologists, "Diabetes 2000" will stress involvement of other physicians and medical specialty organizations in the planning and implementation of the project. The importance of finding ways to develop effective partnerships among the patient's primary physician, the ophthalmologist, and the patient in the management of diabetic eye disease is a major goal. Another important aspect of the project is the identification and promotion of existing diabetes eye health programs around the country, such as the Centers for Disease Control (CDC) Diabetes Translation Project. The AAO will encourage ophthalmologists to participate in national, regional, and local programs that are already in operation, as sponsored by such organizations as the American Diabetes Association, the Juvenile Diabetes Foundation, Lions Clubs, and others.

### Maryland Ophthalmologists are Participating

Educational materials are being developed and demonstration projects are underway in some states to encourage ophthalmologists and other physicians to participate in continuing educa-

tion programs concerned with the overall management of diabetic retinopathy. A Preferred Practice Pattern on diabetic retinopathy is available through the offices of the American Academy of Ophthalmology (415-561-8500).<sup>2</sup> This document provides the latest information concerning the management of diabetic retinopathy. The Maryland Society of Eye Physicians and Surgeons is actively involved in this national initiative. Ophthalmologists in Maryland are eager to help develop the necessary educational and service programs that will achieve this goal.

"Diabetes 2000" will parallel a major diabetic retinopathy public information campaign recently announced by the National Eye Institute (NEI). The NEI's National Eye Health Education Program (NEHEP), which targets both diabetic retinopathy and glaucoma, is fashioned along the lines of earlier federal initiatives against smoking and high blood pressure.

By continuously updating our medical knowledge and skills related to this multi-system disorder, and by forging partnerships between physicians in the effective and efficient management of diabetic patients, we have a unique and important opportunity -- we can reduce preventable blindness from diabetes by the year 2000.

Secretary for Continuing Education,  
American Academy of Ophthalmology  
"Diabetes 2000" National Project Director

#### ARNALL PATZ MD

Past President, American Academy of Ophthalmology,  
"Diabetes 2000" National Chairperson

Co-Director of the Retinal Vascular Service at Johns Hopkins) chaired the American Academy of Ophthalmology Quality of Care Committee responsible for development of the landmark *Preferred Practice Patterns*, including one on the management of diabetic retinopathy. These documents have been widely disseminated and praised, and deserve the attention of all ophthalmologists and other physicians treating diabetic patients.

Proven advances in the treatment of diabetic retinopathy make it frustrating for ophthalmologists to initially see patients only after they have suffered devastating complications and visual loss. Available proven treatment techniques

make it mandatory that individuals managing diabetic patients be educated about the importance of early detection of diabetic retinopathy. Maryland ophthalmologists will take part in instructing other physicians in early detection of diabetic retinopathy and timely referral for ophthalmological evaluation.

Medicine has the tools to prevent diabetic blindness. The Maryland Society of Eye Physicians and Surgeons and the American Academy of Ophthalmology should be congratulated for implementing the "Diabetes 2000" project, with its ambitious goal of eliminating needless diabetic blindness.

### Acoustic Neuroma

Acoustic neuromas represent 60 to 90 percent of all cerebellopontine angle masses and 8 to 10 percent of all intracranial tumors.<sup>1</sup> Other names frequently applied to this tumor include acoustic schwannoma and acoustic neurilemmoma. Most arise from the superior vestibular branch of the eighth cranial nerve. They generally produce hearing loss, tinnitus, and difficulty with balance. Incidence peaks in individuals forty to sixty years of age. Bilateral acoustic neuromas are typically found in type 2 neurofibromatosis.<sup>2</sup>

#### Clinical Features

The symptoms resulting from an acoustic neuroma are secondary to pressure on the acoustic nerve. These symptoms are usually slowly progressive and include sensorineural hearing loss, tinnitus, and loss of balance. It is unusual for a patient to present with only tinnitus. Clinical assessment should include a history and physical, audiogram, brainstem evoked response, and magnetic resonance imaging (MRI). The most sensitive non-imaging study is brainstem electrical response audiometry which is reportedly 89 percent accurate.<sup>1</sup>

Treatment is primarily surgical removal. To preserve maximum hearing, the lesion should be removed when it is at the smallest possible size. Three surgical approaches are commonly used: translabyrinthine, suboccipital, and middle cranial fossa. The last two approaches allow preservation of hearing.

#### Pathology

Acoustic neuromas are benign, slow-growing, encapsulated tumors composed of Antoni type A and type B tissue. Type A tissue is structurally compact while type B tissue has a loose consistency and shows more frequent cyst formation. These tumor cysts are frequently large enough to be seen with MRI or computed tomography (CT). Associated arachnoid cysts can also be seen. Acoustic neuromas range in size from several millimeters to greater than 8 centimeters.

#### Radiology

MRI has replaced CT as the imaging study of choice in assessing acoustic neuromas. For detection of small lesions, particularly those that are intracanalicular in location, gadolinium-enhanced MRI has replaced air contrast CT cisternography as the study of choice. Typical findings on MRI or CT are a rounded mass in the cerebellopontine angle cistern which is centered at the acoustic porus. The lesion frequently extends into the internal acoustic canal (IAC). Flaring of the porus is common. A small percentage of

lesions are completely intracanalicular. Indirect findings include widening of the ipsilateral middle cerebellar peduncle, and compression and displacement of the fourth ventricle.

On MRI, the lesion is usually intermediate in signal on T1 weighted images and high in signal on T2 weighted images. Marked, relatively homogeneous gadolinium enhancement is common and non-enhancing regions may reflect cyst formation (Figures 1 and 2). Larger lesions tend to be less homogeneous (Figures 3 and 4).

The differential diagnosis of cerebellopontine angle lesions includes meningioma, epidermoid, arachnoid cyst, nonacoustic schwannoma, lipoma, and vascular lesions. These are usually readily differentiated by MRI.

## Board of Physician Quality Assurance Actions

**In the Matter of  
Mohammed H. Amirgholi MD  
Before the  
Maryland Board of  
Physician Quality Assurance**

### **Amended Final Decision**

**B**y Final Decision dated February 5, 1990, the Board of Physician Quality Assurance (the Board) voted to revoke the license of Mohammed H. Amirgholi MD (the Respondent). The Final Decision contained no time period or conditions for petitioning the Board for reinstatement of his license.

COMAR 10.31.01.12.C states:

When an order of revocation or suspension states a time for reinstatement of a license, the accused shall make written request for reinstatement to the Commission at the expiration of the stated time. When a time period is not stated on the order, a petition for reinstatement may not be entertained before the expiration of one year after the date of the Order.

The Board's Final Decision stated no time period at which the Board would consider a petition for reinstatement. Therefore, Respondent cannot petition for reinstatement of his license prior to February 6, 1991. However, since the time that Respondent's license was revoked, Respondent has sought guidance from the Board as to what he could do in order for the Board to consider reinstating his license. Therefore, the Board, through its Settlement Conference, met with Respondent and his attorney on Wednesday, December 5, 1990. The Settlement Conference made recommendations to the Board as to what Respondent must accomplish in order for the Board to consider reinstating his license when Respondent is permitted to petition the Board.

At its meeting on December 12, 1990, the Board considered the Settlement Conference's recommendation and voted to amend its Final Decision as follows.

### **Findings of Fact**

1. The Findings of Fact of the Board's Final Decision dated February 5, 1990 are incorporated by reference.
2. Respondent's license was revoked on February 5, 1990. Since on or about the spring of 1990, Respondent has sought guidance from the Board as to what he could accomplish in order that the Board would consider reinstating his license.
3. Respondent took a BioEthics Course in June, the 3rd to the 9th, 1990, from Georgetown University for twenty-three Category 1 continuing medical education credits.
4. Respondent submitted ninety-five Category 1 continuing medical education credits for grand rounds and regularly

scheduled medical conferences for the academic year 1989-1990 from Johns Hopkins Hospital.

5. Respondent is taking courses in otolaryngology from The Johns Hopkins Hospital's Department of Otolaryngology.
6. Respondent submitted a statement from Washington Free Clinic, Washington, DC, that "he has been of immense help to (the Clinic) in fulfilling our mission of providing high quality health care to uninsured Washingtonians who lack health insurance." (Letter dated November 2, 1990, from the Director of the Washington Free Clinic.)
7. Respondent submitted a letter from his therapist (dated November 14, 1990) which indicated that Respondent is making progress and has been "regular, serious and thoughtful" and "is strongly committed to working again and recovering a productive stature. He is determined to contribute to this society in a move to heal hurts he has caused."

### **Conclusions of Law**

The Board incorporates by reference the conclusions of law contained in its Final Decision of February 5, 1990 and further concludes that Respondent's license is REVOKED and Respondent cannot petition the Board for reinstatement of his license until February 6, 1991, being governed by HO §14-509.

### **Order**

By a majority vote of the full authorized membership of the Board considering this matter it is hereby this 26th day of December 1990

ORDERED that the Board will not consider Respondent's petition for reinstatement of his license until such time as Respondent submits evidence of the following:

1. Respondent has continued in therapy on a regular basis with his therapist. Respondent's therapist must submit a report to the Board indicating the progress Respondent is making and the number of times Respondent sees his therapist from December 5, 1990 to the time of the Petition for Reinstatement. Respondent must sign a release permitting the therapist to report to the Board;
2. Respondent has completed all continuing education requirements for three years proceeding the time of the petition for reinstatement, such requirements being fifty credits for each year;
3. Respondent has continued working in the Washington Free Clinic and the Director has submitted a report indicating the nature of Respondent's duties and the time Respondent gives weekly to the Clinic from December 5, 1990 to the time of the Petition for Reinstatement; and
4. Respondent has been evaluated by Edward J. Kowalewski MD, Professor Emeritus, School of Medicine,

University of Maryland at Baltimore, Department of Family Medicine (the Evaluator). The evaluation would cover an overview of Respondent's practice and focus upon Respondent's knowledge and practice of otolaryngology. Respondent would bear the expense of this evaluation and must sign releases permitting the Board to give the Evaluator information to assist in the evaluation, permitting the Board to inform the Evaluator of the final resolution of this matter, and permitting the Evaluator to forward his report to the Board. Respondent must comply with all reasonable requests of the evaluator; and be it further

ORDERED that in the event that the Evaluator's report reveals no deficiencies, the Board would stay the revocation of Respondent's license subject to the following conditions of probation:

1. Respondent would be permitted to return to a practice setting approved by the Settlement Conference and practice under supervision. Respondent would sign a release permitting the Board to receive monthly reports from Respondent's supervisor;
2. Respondent has taken and passed the first available Special Purpose Examination (SPEX) with a score of 75. Respondent shall bear the expense of taking this examination; and be it further

ORDERED that in the event that Respondent fails the SPEX, the stay on the revocation of Respondent's license would be lifted; and be it further

ORDERED that in the event that Respondent passes the SPEX examination and his supervisor's reports are satisfactory, Respondent would be permitted to practice without supervision in a practice setting approved by the Board or the Settlement Conference subject to the following conditions:

1. For three years Respondent would be subject to practice reviews, the expense of which would be his responsibility. In the event that the practice review indicated that Respondent was a danger to himself or the public, the stay of revocation would be lifted without prior notice and an opportunity to be heard provided that Respondent was given a hearing within thirty days of requesting same. In such a hearing, the burden of proof would be preponderance of the evidence; and
2. Respondent must take twenty-five additional Category 1 hours of continuing education approved by the Board or the Settlement Conference; and be it further

ORDERED that in the event that the Evaluator's report reveals deficiencies in Respondent's medical practice, Respondent must remediate the enumerated deficiencies and follow any reasonable recommendations given by the Evaluator prior to petitioning the Board for reinstatement of his license; and be it further

ORDERED that in the event that the Board stays the revocation of Respondent's license and thus reinstates

Respondent's license, the Board can impose any additional reasonable conditions of probation; and be it further

ORDERED that this Order is considered a public document pursuant to *Md. State Gov't Code Ann.*, §10-611 *et seq.*

ISRAEL H. WEINER MD, Chairperson  
Board of Physician Quality Assurance

### Consent

By signing this Consent, I hereby accept and agree to be bound by the foregoing Consent Order and its conditions and restrictions, consisting of eight pages.

1. By signing this Consent, I hereby submit to this Order and its conditions.
2. I acknowledge the validity of this Order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this Order.
3. I acknowledge that by consent to this Order, I am waiving my right to challenge in court the legal authority of the Board of Physician Quality Assurance to take action against my license to practice medicine in the State of Maryland.

I, Mohammed H. Amirgholi MD, have read this Consent Order and have carefully reviewed each and every part with my attorney, Kenneth Michael Robinson, Esquire. I understand it and voluntarily agree to it.

I sign and consent to this Order after having an opportunity to consult with counsel and with full understanding of the meaning and the terms of the Order.

MOHAMMED H. AMIRGHIOLI MD

In the Matter of  
Sarkis Sarkissian MD  
Before the  
Maryland Board of  
Physician Quality Assurance

### Consent Order

On October 24, 1990, the State Board of Physician Quality Assurance (the Board), acting pursuant to its authority under *Md. State Gov't Code Ann.* §10-405, held a hearing on a proposed Summary Suspension of the license of Sarkis Sarkissian MD (the Respondent) to practice medicine in the State of Maryland.

The Board considered the peer review report of the Peer Review Management Committee (PRMC) and documents submitted to the Board by the assigned Administrative Prosecutor during its hearing on October 24, 1990. Also

heard from were the Respondent, the Respondent's counsel, and the assigned Administrative Prosecutor.

At the conclusion of the October 24, 1990 hearing, the Board indicated that it would permit the Respondent, the assigned Administrative Prosecutor, and the Board to sign a Consent Agreement in lieu of the proposed Summary Suspension.

On October 24, 1990, the Board, the Respondent, and the assigned Administrative Prosecutor all executed a six-page document known as the Consent Agreement. The Consent Agreement limited the nature of the Respondent's medical practice during the pendency of charges to be brought against the Respondent. The Consent Agreement prohibited the Respondent from conducting any hysterectomies pending the outcome of the charges against the Respondent. The full text of the October 24, 1990 Consent Agreement is attached to this Consent Order and incorporated herein as Exhibit A.

On October 16, 1990, the Board, pursuant to *Md. State Gov't Code Ann* §10-405, voted to summarily suspend the Respondent's license. In addition, on October 16, 1990, the Board voted to charge the Respondent under *Md. Health Occ. Code Ann.* §14-404(a)(3), (4), and (22) (1990 Cum. Supp.). Consequently, on November 9, 1990, charges, were issued in accordance with the Board's vote.

The pertinent provisions of §14-404(a) provide:

Subject to the hearing provisions of §14-405 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:

- (3) Is guilty of immoral or unprofessional conduct in the practice of medicine;
- (4) Is professionally, physically, or mentally incompetent;
- (22) Fails to meet the appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this State.

On January 9, 1991, a settlement conference was held regarding resolving the outstanding charges. At the settlement conference, a proposal was made for the resolution of this matter. The proposed resolution of this matter was presented to the Board at its meeting on Wednesday, January 23, 1991. On an affirmative vote of a majority of its full authorized membership, the Board decided to enter into the following Consent Order.

### Findings of Fact

1. The Respondent has been licensed to practice medicine in the State of Maryland since 1983.
2. The Respondent has been practicing medicine in St. Mary's County, Maryland since 1987.
3. The Respondent maintains a private office for the practice of medicine at 104 Scarlet Oak, California, St. Mary's County, Maryland 20619.
4. In June of 1987, Patient N<sup>1</sup> came under the care of the

Respondent for treatment in the area of her groin. In August of 1987, Patient N was admitted to Calvert Memorial Hospital where the Respondent performed a total abdominal hysterectomy upon Patient N.

5. In January of 1989, Patient N filed a Health Claims Arbitration Claim against the Respondent alleging, among other complaints, that the Respondent deviated from the generally accepted standards of medical care by negligently and recklessly performing an unnecessary total abdominal hysterectomy and bilateral salpingo-oophorectomy on her normal organ structure.
6. Patient N's filing of a Health Claims Arbitration action against the Respondent caused the Board to initially call for a peer review of the single case filed by Patient N. As a result of the peer review of Patient N's file, the Board subsequently ordered a peer review of the then twenty most recent hysterectomy patients of the Respondent.
7. Two peer reviewers each reviewed ten different recent hysterectomy cases of the Respondent. The two peer reviewers each separately concluded that numerous hysterectomies conducted by the Respondent were either questionable or unjustified surgeries.
8. The Respondent was the treating physician and the surgeon who conducted the hysterectomies on Patients A through N as listed in the Charging Document dated November 9, 1990.
9. The Respondent's care and treatment of Patients A through N failed to meet the appropriate standards of care for the delivery of quality medical and surgical care. (Patients A through N range in age from twenty-six through seventy-three years old.)
10. The appropriate standard of care requires that when treating patients with complaints of vaginal bleeding and/or groin pain, the gynecologist determine whether long-term hormone management can be utilized to control the patient's presenting condition(s). The appropriate standard of care requires that hormone management be considered in conjunction with proper diagnostic testing in determining whether a hysterectomy is the appropriate treatment. The Respondent failed to meet the appropriate standard of care in his treatment of seven (A, D, F, G, H, I, and J) patients in that he failed to use alternate methods of treatment prior to performing hysterectomies on them. In particular, the appropriate standard of care required attempts (or in some cases, longer attempts) at hormonal regulation or repeat dilatation and curettage (D&C) procedures. These patients range in age from twenty-six years to forty-seven years old.
11. The appropriate standard of care requires that the treating gynecologist know when a patient's diagnosis requires surgical intervention and when other treatment is appropriate. The Respondent failed to meet the appropriate

<sup>1</sup> Patient names are not used in this Consent Order because of the confidentiality provisions of Health General Article §4-301 *et seq.*

standard of care in his treatment of two (B and E) patients by performing hysterectomies based upon the diagnosis of squamous metaplasia or cystic hyperplasia since those diagnoses are not recognized indications for hysterectomy.

12. The appropriate standard of care required that the treating physician be prepared to provide the patient with proper medical care after his/her surgery. The appropriate standard of care requires that the physician take appropriate specimens during surgery, for analysis, and that the treating physician refer the patient to medical specialists after surgery, when appropriate. The Respondent failed to meet the appropriate standard of care with regard to two (L and M) patients when he proceeded properly with the hysterectomies, but failed to: (1) obtain separate lab specimens during surgery and (2) provide for postoperative treatment, including referral to gynecologic oncologists.
13. The appropriate standard of care requires a treating physician to keep full and accurate records of the medical condition(s) of all patients under his or her care. The appropriate standard of care requires that the physician keep the patient's medical records in a condition that would permit any other qualified physician to take over the care and treatment of the patient and be able to rely on the existing records. The respondent failed to meet the appropriate standard of care in his treatment of four (G, H, K, and L) patients by failing to keep adequate medical records regarding their conditions.

### Conclusions of Law

Based upon the Findings of Fact and in reaching this Consent Order, the Board concludes, as a matter of law, that the Respondent failed to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this State, (See former *Md. Health Occ. Code Ann.* §14-404(a)(22), present HO §14-404(a)(22).)

The Board dismisses the charges under former *Md. Health Occ. Code Ann.*, §14-504(a)(3) and (4) (present HO §14-404(a)(3) and (4)): (3) Is guilty of immoral or unprofessional conduct in the practice of medicine; and (4) Is professionally, physically, or mentally incompetent.

### Order

Based upon the foregoing Findings of Fact, it is this 4th day of March 1991, by an affirmative vote of the majority of the full authorized membership of those members of the Board of Physician Quality Assurance of Maryland who considered this case,

ORDERED that the Respondent's license to practice medicine is **SUSPENDED**; and it is further

ORDERED that the **SUSPENSION** of the Respondent's

license to practice medicine in the State of Maryland is **STAYED** and the Respondent is placed on **PROBATION** for a period of three years from the date of this Order; and be it further

ORDERED that the Board **DISMISSED** the charges under former *Md. Health Occ. Code Ann.*, §14-504(a)(3) and (4) (present HO §14-404(a)(3) and (4)): (3) Is guilty of immoral or unprofessional conduct in the practice of medicine; and (4) Is professionally, physically, or mentally incompetent; and be it further

ORDERED that no additional charges regarding the Respondent's conduct of hysterectomies, prior to October 26, 1990, will be the subject of any charges under the Maryland Medical Practice Act against the Respondent; and be it further

ORDERED that the Respondent is subject to the following conditions of probation for a period of three years from the date of this Order:

1. The Respondent may continue to practice medicine.
2. The Respondent's surgical practice of medicine shall be limited by the terms of this probation.
3. The Board has full power to suspend the Respondent's license to practice medicine, on a summary basis, should the Respondent fail to abide by the conditions of his probation.
4. The Respondent will conduct no surgery in any facility in the State of Maryland except, the Respondent may continue to admit patients to hospitals for purposes of labor and delivery or scheduled Cesarean sections. He also may admit patients to acute care hospitals for medically indicated treatment of miscarriage or spontaneous abortions, including dilatation and curettage (D&C). He also may perform amniocentesis, circulage, dilatation and curettage for postpartum bleeding, and treatment of ectopic pregnancy (including laparoscopy and laparotomy).
5. In the event that a patient admitted for labor and delivery were to require surgery during the course of her labor and delivery, the Respondent may proceed with those limited surgeries. No elective procedures are included in those surgeries. Patients admitted for Cesarean sections also may not have additional elective surgery organ removals during their surgery. In the event that a patient of the Respondent desires tubal ligation during her childbirth, vaginal delivery, or Cesarean section, then the Respondent may go forward with that procedure.
6. Respondent may perform circumcisions.
7. Respondent may perform tubal ligations.
8. The Respondent is permitted to continue his office practice of obstetrics and gynecology in St. Mary's County, Maryland.
9. If the Respondent performs a Cesarean section or other surgery, the Respondent shall notify Valarie A. Shanahan, Compliance Officer, or, in her absence, Margaret T. Anzalone, Deputy Director of the Board of Physician Quality Assurance immediately, within seven days of any

surgeries he performs under the terms of his probation including but not limited to Cesarean sections, emergency removal of reproductive organs, emergency salpingo-oophorectomies, emergency total or partial hysterectomies, or any other surgical procedure conducted by the Respondent. The Respondent shall further advise the Board of the name of the patient involved, the time and place of said surgery, and the nature of the circumstances that caused the Respondent to perform the surgery.

10. The Respondent has submitted to an expedited peer review to include, at a minimum, twenty Cesarean sections. Should the Board determine that the results of this peer review warrant action, the Board may take the action it deems necessary with respect to the Respondent's license notwithstanding Respondent's present suspension with stay and probation. However, should the Board desire to take any action, the Board will notify the Respondent's counsel in addition to notifying the Respondent at the time that the Board acts.
11. The Respondent will be subject to an annual peer review of his practice by the Board, administrative costs to be paid for by the Respondent, and conducted by the Board's duly authorized agent or agents. The first peer review should occur on or about March 1, 1992, and shall be conducted in accordance with the Board's *Peer Review Manual*.
12. The Respondent shall complete an additional twenty-five hours of Board approved Class I Continuing Medical Education credits each year, over and above the normal requirements, during his probation. The Respondent shall bear all costs involved with his attendance and completion of the Continuing Medical Education programs. A month before taking the continuing education credits, Respondent shall submit to the Board's Settlement Conference and Case Resolution Committee, his request for approval of his continuing education credits, together with any information necessary for the Board to evaluate the proposal, and be it further

ORDERED that if Respondent demonstrates, three years after the execution of this Consent Order, that he has met the conditions of probation, Respondent may submit a petition to the Board for reinstatement of his license, and be it further

ORDERED that should the Respondent retire from the practice of medicine pursuant to this Consent Order, the Respondent will no longer be required to comply with the conditions of probation. In the event that the Respondent chooses to retire from the practice of medicine, he will sign and deliver a letter to the Board of Physician Quality Assurance requesting that his medical license be placed on an inactive status. At the time of his taking an inactive status, the Respondent shall turn in his DEA and CDS licenses. Respondent shall be required to fill out the appropriate application and pay the required fee; and be it further

ORDERED that if Respondent retires from the practice of

medicine, the Respondent will provide the Board with copies of his letters of resignation to all hospitals where he maintains privileges within five days of those resignations, and be it further

ORDERED that the Respondent will be responsible for all costs incurred under this Consent Order; and be it further

ORDERED that this Consent Order is considered a public document pursuant to *Md. State Gov't Code Ann. §10-611, et seq.*

ISRAEL H. WEINER MD, Chairperson  
Board of Physician Quality Assurance

### Consent

By signing this Consent, I hereby accept and agree to be bound by the foregoing Consent Order and its conditions and restrictions, consisting of fourteen pages.

1. By signing this Consent, I hereby do not admit to the truth of the Findings of Fact or agree with the charges or the Conclusions of Law. Indeed, I dispute and deny any liability or wrongdoing. However, I submit to the foregoing Order in a desire to settle and resolve this litigation.
2. I hereby acknowledge the validity of this Order as if made after a hearing in which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses on my own behalf, and to all other substantive and procedural protections provided by law.
3. I also recognize that I am waiving my right to appeal any adverse ruling of the Board that might have followed any such hearing. By this Consent I waive all such rights.
4. I sign this Order after having an opportunity to consult with an attorney, without reservation, and I fully understand its meaning and effect.

SARKIS SARKISSIAN MD

### Exhibit A

In the Matter of  
Sarkis Sarkissian MD  
Before the  
Maryland Board of  
Physician Quality Assurance

### Consent Agreement

Comes now the Respondent Dr. Sarkis Sarkissian by and through counsel Wendy L. Shiff of Anderson, Coe and King and the State of Maryland by and through Steven P. Lemmey, Assistant Attorney General, Administrative Prosecutor to the Board of Physician Quality Assurance and the Board and hereby state the following:

1. Pursuant to the Board's investigation of the practice of Dr. Sarkis Sarkissian, the Board voted on October 16, 1990 to issue a Consider Emergency Action on the Respondent's license to

- practice medicine. The Board's actions were based upon the Board's receipt of the Peer Review Committee Report and the reports of the two assigned peer review specialists.
2. On October 22, 1990, the Respondent was advised, by telephone, of the Board's intention to take action. At that time he was further advised to retain the services of an attorney. Later on October 22, 1990, the Respondent was able to retain the services of Wendy L. Shiff as his attorney for this matter.
  3. The Respondent, through his counsel, has indicated that he wishes to consent to this Agreement subject to its conditions. As part of this Agreement, the Respondent will retain his license to practice medicine subject to the following conditions:
    - a. He may continue to practice medicine.
    - b. He waives his right to a hearing regarding any emergency action being considered by the Board on October 24, 1990, in Case 89-0479.
    - c. His surgical practice of medicine shall be limited by the terms of this Agreement.
  4. The Respondent and the State seek to avoid the necessity of a hearing on the Emergency Action by requesting that the Board accept this Consent Agreement.
  5. The Respondent agrees that the Board has full power to entirely suspend his license to practice medicine, on a summary basis, should he fail to abide by the conditions set out in this Consent Agreement.
  6. Effective immediately, it is specifically agreed that Dr. Sarkis Sarkissian may continue his practice of medicine in the State of Maryland pending the outcome of the charges that are to be brought against him under the Maryland Medical Practice Act. The Respondent may continue the practice of medicine pending the outcome of those charges conditioned upon his agreement that:
    - a. The Respondent will conduct no surgery in any facility in the State of Maryland except, the Respondent may continue to admit patients to hospitals for purposes of labor and delivery or scheduled Cesarean sections. He also may admit patients for medically indicated treatment of miscarriage or spontaneous abortion.
    - b. In the event that a patient admitted for labor and delivery were to require surgery during the course of her labor and delivery, the Respondent may proceed with those limited surgeries. No elective procedures, sterilization, or organ removals are included in those surgeries. Patients admitted for Cesarean sections also may not have additional elective surgery or organ removals during their surgery. In the event that a patient of the Respondent desires tubal ligation during her childbirth, then the Respondent may go forward with that procedure, provided that the patient has obtained a second obstetric opinion that the tubal ligation is appropriate.
    - c. All other surgery required by any of the Respondent's patients must be referred to other qualified physicians by the Respondent and the Respondent's only role in those surgeries shall be that of providing the medical records to the new physician and any other information or assistance that the new physician may request of him with regard to the referred patient.
    - d. The Respondent is permitted to continue his office practice of obstetrics and gynecology in St. Mary's County, Maryland.
    - e. The Respondent and the Board must execute this Consent Agreement by the close of the Board's business on October 24, 1990.
  7. If the Respondent performs a Cesarean section or other surgery,

the Respondent shall notify Stephen H. Johnson, Esq., Chief Case Manager, or, in his absence, Margaret T. Anzalone, Deputy Director of the Board of Physician Quality Assurance immediately, (within forty-eight hours) of any surgeries he performs under this Agreement including but not limited to Cesarean sections, emergency removal of reproductive organs, emergency salpingo-oophorectomies, emergency total or partial hysterectomies, or any other surgical procedure conducted by the Respondent. The Respondent shall further advise the Board of the name of the patient involved, the time and place of said surgery, and the nature of the circumstances that caused the Respondent to perform the surgery.

8. The Respondent shall submit to an expedited peer review to include, at a minimum, twenty Cesarean sections. If the Board determines that the results of this peer review indicate a threat to the public, the Board may suspend the Respondent's license summarily.
9. The parties also agree that the Board shall advise all hospitals, in Maryland, where the Respondent has active privileges of the full and complete content of this Agreement.
10. The Respondent and Office of the Attorney General hereby state that this document represents the full and complete content of the Agreement between the Board of Physician Quality Assurance and the Respondent, Sarkis Sarkissian. The Respondent further states that he had an opportunity to review this Consent Agreement with his counsel and that he wishes for the Board of Physician Quality Assurance to adopt this Order.

The foregoing five-page document is agreed upon, by the p (sic - arties this 24th) day of October 1990 by the State Board of Physician Quality Assurance through Israel H. Weiner MD, Chairperson, and the Respondent, Sarkis Sarkissian MD

ISRAEL H. WEINER MD, Chairperson

Administrative Prosecutor

**In the Matter of  
Angelita A. Topacio MD  
Before the  
Maryland Board of  
Physician Quality Assurance**

### **Order Terminating Probation and Reinstating License**

**B**y Order dated November 6, 1989 (the 1989 Order), the Board of Physician Quality Assurance (the Board) found Angelita A. Topacio MD (the Respondent) guilty of committing prohibited acts as set forth in Health Occupations Article, *Annotated Code of Maryland* (HO) §14-404. Specifically,

the Board charged Respondent with violation of Conditions of the Final Order of April 10, 1984 issued by the Commission on Medical Discipline (the Commission). The Board released Respondent from the probation imposed in the Final Order of April 10, 1984, and placed Respondent on probation for one year, conditioned upon the Respondent complying with conditions of probation (the Conditions of Probation). The Order further provided that one year from the effective date of the Order, that being November 6, 1990, if the Respondent demonstrated to the Board's satisfaction that Respondent had complied with the terms and conditions of his probation, the Board would entertain a petition for altering the terms of Respondent's probationary status.

By letter dated November 20, 1990, Respondent petitioned the Board for Termination of Probationary Status and Reinstatement of her License (Petition) to practice medicine in Maryland. At its meeting on February 13, 1991, the Board reviewed Respondent's Petition. Based upon the Board's review of the Petition, the Board determined that Respondent had fulfilled the Conditions of Probation contained in the 1989 Order.

### Findings of Fact

Based on the information known and available to it, the Board finds that:

1. The Board has not received any new complaints on the Respondent. No hospital reports or malpractice claims have been filed against the Respondent since the time of the 1989 Order.
2. On August 28, 1990, the Board referred this case to the Medical and Chirurgical Faculty of Maryland for a peer review. An office review was conducted on September 21, 1990. Based upon the report from the office visit, the Practice Review Committee recommended that Respondent be released from probation at this time.

### Conclusions of Law

The Board concludes, as a matter of law, that Respondent has satisfactorily complied with all conditions of probation as set forth in the Order of 1989.

### Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 25th day of February 1991 by a majority vote of the full authorized membership of the Board

ORDERED that effective as of the date of this Order, the Conditions of Probation imposed upon Respondent's practice of medicine by the Board's 1989 Order are hereby TERMINATED and of no further force and effect; and be it further

ORDERED that Respondent's license to practice

medicine in the State of Maryland be REINSTATED without any condition or restriction whatsoever; and be it further

ORDERED that this is a Final Order and as such is considered a public document pursuant to the Maryland Public Information Article, State Government Article, *Annotated Code of Maryland*, §§10-611 *et seq.*, specifically §10-617(h)(2)(vi).

ISRAEL H. WEINER MD, Chairperson  
Board of Physician Quality Assurance

### Upper Park Heights Park Newport Apartments

2 bedroom residents from \$795, includes heat and hot water, electric additional.

## Maryland Metabolic Institute Announces Their New Location and Continuation of Services

A new strategy to improve patient care

*We help the physician  
by helping the patient  
help themselves*

**H**ealth can be maintained by teaching patients good care habits. Especially for those with needs related to:

- diabetes including gestational diabetes
- weight reduction and maintenance
- dietary problems of all types
- stress management

Now the time consuming burden of patient training can be transferred from a busy practice to a competent health care team. A certified nurse educator, master trained dietitians and behavior counselors will return the patient well educated to their primary care physician.

Training Programs Include:

### Diabetes Education

- 20-hour courses, children and adults
- glucose monitoring
- ambulatory insulin instruction
- diabetes and pregnancy
- gestational diabetes

### Behavior Modification

- weight reduction and maintenance
- modified fasting: Optifast
- limited diets: Optitrim
- full food control: LEARN®
- stress management

### Dietary Counseling

- all medical disorders

Call for an appointment or further information or have patients schedule a consultation.

## Auxiliary

### Component Society Presidents: 1991-1992

**Allegany County** - Mano Nava  
(Mrs. Samuel)

As President, Mrs. Nava plans to continue the Auxiliary's project of working with the schools to teach healthy eating habits. She has established two new committees -- a medical family support group and a long-range planning committee

charged with developing a five-year plan. She has also instituted a gavel club for past presidents. Encouraging past auxiliary members to rejoin remains an ongoing goal.

Mrs. Nava's other volunteer activities include duties at an adult day-care center, the Red Cross, and a high school. Her husband is a psychiatrist.

**Baltimore County** - Dianne Nagel  
(Mrs. J. David)

As President, Mrs. Nagel plans to center the Auxiliary's health projects around children and their needs. These efforts will be coordinated with the Baltimore County Health Department and Department of Social Services. Auxiliary

members will also work with hospitals' newborn nurseries to determine needs (for example, supplying layettes and clothing). Every attempt will be made to involve the membership in projects that can easily fit within time-frames available to members with careers.

Mrs. Nagel is a registered nurse who is active in the Parent Association and is on the Maryland State Association of Quality Assurance Professionals Committee. Her husband, an internist, is the 1991-1992 President of Med Chi.

**Anne Arundel County** - Margaret Lynch  
(Mrs. Garrett)

This year Mrs. Lynch hopes to have members become active in projects. These include the Senior Health Fair in October, Holiday Sharing, Children's/Seniors' holiday, and giving gifts for Sarah's House, a homeless shelter.

Mrs. Lynch also volunteers in her children's school as well as teaching aerobics to seniors. Her husband is an orthopaedist.

**Charles County** - Fatima Haziq  
(Mrs. Mohammed)

This Auxiliary sponsors sports physicals during the summer. The money raised goes toward scholarships for high school students planning to enter health-related fields. The Auxiliary also helps send children to football camp and

provides t-shirts for children at sports camp.

In addition to guiding the Auxiliary, Mrs. Haziq volunteers in her daughter's school and works in her husband's office. Her husband, a urologist, is a Past President of the Charles County Medical Society.

**Baltimore City** - Adriana Zarbin  
(Mrs. Gino)

Mrs. Zarbin is both Acting President and Treasurer of the Baltimore City Medical Auxiliary. She has been President twice before and has held most of the positions in between! Her goal is to "hold the Auxiliary together."

Her primary hobby is music and she is a Past President of the Opera Guild. Her three sons include an ophthalmologist, a dentist, and a lawyer. Her husband, a pediatrician, has long been a member of Med Chi.

**Frederick County** - Maria Baker  
(Mrs. J. Fred)

Mrs. Baker would like the Auxiliary to give Doctors' Day more exposure and to expand health projects.

A "retired" pharmacist and medical technologist, she also is active in the Frederick Memorial Hospital Auxiliary

(especially fund-raising for hospital expansion), in her church, and in the garden club. Her husband is a pediatrician and Past President of the Frederick County Medical Society.

#### Harford County - Denise Cann (Mrs. Ronald)

Increasing membership and encouraging current Auxiliary members to be more active are important goals for Mrs. Cann. Health education programs for the schools will be a special emphasis this year although the Auxiliary also hopes to have more family social activities.

Her other volunteer interests are her son's school, the Occupational Therapy Association, and Temple Auxiliary. Mrs. Cann is an occupational therapist, although she is not currently working in that field. Her husband is a psychiatrist.

**Howard County** - Helene Segal (Mrs. Carl)

Mrs. Segal is acting President this year. She has previously served as President for two years, as Chairperson of Doctors' Day, and as editor of *Hygeia Filiae* for two years, and has been actively involved in the Auxiliary for more than fifteen years.

Mrs. Segal is currently on the nursing staff at Johns Hopkins Hospital, although she took off some time when her mother died of leukemia last summer. Her husband is a psychiatrist in Columbia and has served on several Med Chi committees in the past. They have four children and two grandchildren. Her hobbies are counted cross-stitch, embroidery, and reading.

#### Kent County - Elizabeth Donovan (Mrs. David)

Mrs. Donovan plans for this small close-knit Auxiliary to lend support to the doctors of the medical society in whatever way needed and to be involved in community work.

She is a registered nurse in the Kent County Hospital Emergency Room, is involved in KART (riding rehabilitation for the handicapped), and volunteers in the Kent and Queen Anne's Hospital Auxiliary's Christmas shop. Her husband is a pathologist.

#### Montgomery County - Karen Mausner (Mrs. Mark)

As President of the Auxiliary this year, major goals for Mrs. Mausner are families helping families and membership. Through a holiday boutique, she would like to focus on fund-raising for a homeless shelter. In addition, there will be

children's programs sponsored at a homeless shelter, as well as a Children's Health and Safety Fair in conjunction with the Montgomery County government.

Mrs. Mausner also volunteers in her children's schools and teaches a self-defense seminar for women. A professional in human resources management, she is married to a plastic surgeon who is Vice Chairman of the Medical Society's Committee on Young Physicians and a member of the Community Affairs and Membership Committees.

**Prince George's County** - Isabelita (Vicki) Casibang MD (Mrs. Vincent)

Dr. Casibang hopes to increase membership by having the Auxiliary offer something to members such as lectures or a shopping spree. This year, the Auxiliary will raise funds for AMA-ERF, community

services, and the Ardmore and Ardwick Rehabilitation Center through a luau and an auction of items donated by businesses.

A member of the Philippine Medical Auxiliary, she also serves as National Secretary of VERMM Alum Association. Dr. Casibang's husband is a general surgeon.

#### Washington County - Mary Newby (Mrs. John)

Mrs. Newby hopes to bring back past members and keep them active; transportation and babysitting will be offered for new members. The third year in a row for Organ Annie, other projects include offering scholarships for local students entering medical fields and conducting a health fair at the prison.

Mrs. Newby is a homemaker and part-time student working toward a degree in education. Her free time is divided among the Symphony Guild, the Board of "Dream Come True," and coaching and refereeing soccer. Her husband, a pathologist, is currently President of the Washington County Medical Society.

**Wicomico County - Deborah Raffetto (Mrs. Joseph)**

In addition to involving more members, Mrs. Raffetto plans to have the Auxiliary work closely with the Medical Society to promote health education projects (including AIDS awareness), as well as continue the Organ Annie and

Organ Apron programs. She hopes that children will become aware of their own bodies through the distribution of the book, *The Magic School Bus Inside the Human Body*.

Though not currently working in the field, Mrs. Raffetto is a registered nurse, who volunteers at her children's school library. Her husband is a cardiologist. ■

# MARYLAND

*The Auxiliary  
always welcomes  
new members.*

*Auxiliary members support  
the physicians and are

## Are Your Offices In Need Of Major Surgery?

Chaotic traffic patterns, inadequate waiting areas, abrasive color schemes, a lack of integration of special equipment — all symptoms of a poorly designed medical suite. Symptoms that can increase the stress on your entire staff, cost you time, money and even your patients.

This is why many healthcare professionals seek the services of Levin/Brown. As one of the region's leading architects and interior designers of medical suites, surgery and ambulatory care facilities, laboratories, and medical office buildings, we can show you how to make your offices a far more productive place to practice medicine.

## Eponyms

Bart Gershen MD

**H**odgkin's Disease, discussed in the last *Word Rounds* column, is one of many medical eponyms. However, eponyms are hardly peculiar to medicine. The word itself comes from Greek *epi* -- "upon" and *onyma* -- "name." It refers to proper nouns, names of people or places -- (often lower-cased by history) which have been placed upon, or applied to, ordinary articles or objects.

In future columns, I will focus rigorously on the myriad examples which comprise, in large measure, our own rich patois. But today, let's examine some representative eponyms which are familiar to a general, nonmedical gathering.

**Guppies**, for example -- those inch-long, brightly colored fish found swimming around fresh water aquaria -- are named for RJ Lechmere Guppy of Trinidad who discovered them. **Monkey** wrenches are another example. They were named for the mechanic who invented them. His name was Charles Moncke and he worked for the firm of Bemis and Call of Springfield, Massachusetts.

The **ferris wheel** was invented by George Washington Ferris in 1893, the **saxophone** by Antoine Joseph Sax -- with financial assistance from his good friend Hector Berlioz. **Silhouettes**, shadowy profiles of people, were designed for fun by Etienne de Silhouette, a good friend of Madame **Pompadour**, who had him appointed the Controller General of France in 1759. (She, too, has been eponymized -- her name referring to a style of haircut popular in the 1940s and early 1950s. Remember Ed "Kooky" Byrnes of *77 Sunset Strip*?)

**Chauvinism**, often thought to be the creation of the women's movement, is actually derived from Nicolas Chauvin, a soldier in Napoleon's Grand Army. After suffering multiple wounds in battle, Chauvin was retired on a small pension. But, he so idolized the Little Corporal that even after Napoleon's ignominious defeat -- and for the remainder of Chauvin's life -- the fanatic idolater preached only of the infallibility of his hero and the magnificence of France. A chauvinist was, initially, a provincial, flag-waving jingoist, filled with blind patriotism. Sexist males are a recent modification.

The most famous circus acrobat of the nineteenth century -- the man who perfected the aerial somersault -- is not remembered for that accomplishment; he is recognized for the clothes he wore during the performance. His name was Jules **Leotard**. The men who invented the lighting which lit the stage for his act were German brothers, John and Anton **Kliegl**. Their name was too hard to pronounce; the light they developed is known as the **klieg light**.

During our Revolutionary War, a captain in the Virginia militia from Pittsylvania County organized an impromptu court to rid his territory of Tories and other scoundrels. Unfortunately, the justice dispensed was often as injudicious as it was swift; the men were hanged. The captain was **William Lynch**, and the punishment now bears his name.

One hundred years later and an ocean away, another captain delivered his name to eponymic posterity. The English Earl of Erne owned a huge estate in County Mayo, Ireland. He hired a captain to supervise the tenant farmers on his property. Unfortunately, a series of crop failures, culminating in the famine of 1880-81, made it impossible for the tenants to pay their rent. Instead of sympathy, the captain responded with brutal retribution -- evicting several of the farm families. The farmers and their friends retaliated. No one spoke to the captain. He could not buy food or clothing at the local shops. He was totally ostracized from the community. All his servants left him. Finally he surrendered, quietly taking his family and leaving the country.

His name was Captain Charles Cunningham **Boycott**.

Back in this country, a Texas lawyer, a hero of the war of independence from Mexico, found himself the recipient of a herd of cattle. They were payment for a debt. However, the lawyer was not a rancher and quite uncertain about how to manage this reimbursement. He moved them to an island in the Nueces River, just off the Matagordo Peninsula. A winter drought virtually dried up the river and many of the unbranded cattle wandered across and settled on neighboring ranches. Once there they did not remain unbranded very long.

The lawyer was Samuel Augustus **Maverick**, and his name, too, has found its way into our semantic history.

Several foods owe a debt of gratitude to proper names. Consider **Bibb** lettuce -- named for its developer, an amateur gardener named John B. Bibb. Or the **Bing** cherry -- for a Chinese man who cultivated the tree in Oregon in 1875. Or the **sardine** -- named for the island around which it thrives -- Sardinia.

Consider **bourbon**, which was first produced in Bourbon County, Kentucky. And, **booze** itself, named after its distiller, ES Booze of Philadelphia, who poured the contents into a bottle shaped like a log cabin with his name on the label.

When you think of eponymic food can one ignore **beef stroganoff**, or **beef Wellington**? Count Paul Stroganov, a nineteenth century Russian diplomat, and Arthur Wellesley, the first Duke of Wellington, are responsible for these delights.

And can one possibly overlook the contribution rendered by that eighteenth century libertine and gambler, John Montagu? Refusing to leave the gambling table to eat, he ordered his servant to bring him a slice of roast beef between two pieces of toasted bread. Thus did the Earl of **Sandwich** provide us with that culinary delight. (As the head of the British Admiralty during Captain James Cook's famous voyage, he was honored to have the newly discovered Sandwich Islands named for him as well. They are now, of course, known as the Hawaiian Islands.)

Chicken **tetrazzini** was prepared especially for the Italian diva, Luisa Tetrazzini. And **melba toast** was developed and named for the Australian opera star, Dame Nellie Melba. So,

too, the dessert -- peach ice cream with raspberry sauce -- **peach melba**.

Another dessert, the delectable **praline** -- that crunchy sweet almond roasted in sugar, so popular in New Orleans -- was invented by the Comte du Pressis-Praslin in honor of his guest, King Louis XIV.

In the early 1800s, a Presbyterian minister, convinced that refined white flour was not good for health, urged thousands of his followers to bake bread and crackers with unrefined, whole wheat flour. The products were named after the preacher -- Sylvester **Graham**.

However, we not only find eponyms to eat, we find them to wear as well. **Argyle** socks, named for the Duke of Argyle and his Scottish clan, were originally green and white diamond patterns. Today, only the diamond pattern is preserved; the socks are multi-colored.

On October 25, 1854, Major General James Thomas Brudenell, bedecked in his bright red and blue uniform, led his eleventh Light Dragoons into the teeth of a heavily armed Russian force at Balaclava, Crimea. It was the charge of the Light Brigade, made famous by Alfred Tennyson's epic poem. The General wore his woolen vest to protect against the biting cold. That vest's reputation has outlasted the memory of its wearer, who, by the by, was also known as the seventh Earl of **Cardigan**.

The man who gave the order for that famous and catastrophic charge was the Commander of all British Forces, General Fitzroy James Henry Somerset. He, too, wore a distinctive outfit -- a loose-fitting coat with sleeves that stretched to the neck. This was, in part, to disguise the fact that he had but one arm -- the other having been removed by field surgeons at the battle of Waterloo. The memory of Somerset's exploits, like Brudenell's, has evaporated with the mists of history. But his coat, especially those unique sleeves, are monuments to his memory. He was also known as the First Baron **Raglan**.

Hats have eponymic origins as well. Consider an early nineteenth century Englishman named Edward Stanley. He was fond of horses and horse racing. He also habitually wore a round bowler hat. In 1870, Mr. Stanley instituted an annual race for three-year olds at Epsom Downs. The contest soon became a British favorite whose popularity continues today. In fact, so renowned had this race become, that in 1875, the concept was imported into the United States, has continued to flourish, and is now part of the famous Triple Crown. Mr. Stanley was also known as the twelfth Earl of **Derby**. The English and Kentucky varieties, as well as the hat, all derive from his name.

Then there's the man who first recognized the cowboy's need for a large hat to screen him from the sun. So in 1885, in the city of Philadelphia, he started manufacturing ten-gallon, soft-brimmed, high-domed cowboy hats. The cowboys called them "John B's." The man was John Batterson **Stetson**.

Other apparel has also carried the imprimatur of the

eponym. **Tuxedos** were first developed in Tuxedo, New York. **Bloomers** were developed by Mrs. Elizabeth Miller in 1850 but created such controversy that she and her associates were not allowed to attend church services and were threatened with excommunication. This warning, however, failed to intimidate feminist Amelia Jenks **Bloomer** who wore them provocatively and often, and was rewarded for her valor by their nominal designation to posterity.

BVD is simply the abbreviated (pardon the pun) name for the company which created and manufactured them -- Bradley, Voorhees and Day.

Botanists, too, have had a field day with eponyms. Consider the following partial list: wisteria, fuchsia, poinciana, magnolia, begonia, camellia, poinsettia, dahlia, forsythia, gardenia, and zinnia.

They were named for: Casper **Wistar** MD (Anatomy Professor at the University of Pennsylvania), Leonard **Fuchs** (German physician and botanist - basic Fuchsin, a reddish-purple aniline dye, is also named for him), M. de **Poinci** (Governor of the West Indies in the 1600s), Pierre **Magnol** (French physician and botanist), Michel **Begon** (Royal Commissioner of Santo Domingo in the seventeenth century), George Joseph **Kamel** (Jesuit missionary and amateur botanist), Joel Roberts **Poinsett** (American Minister to Mexico in 1825), Anders **Dahl** (Swedish botanist), William **Forsyth** (Scottish horticulturist), Alexander **Garden** MD (Scottish-American physician and ardent tory, who left South Carolina to return to England during our Revolutionary War), and Johann Gottfried **Zinn** MD (who wrote the first anatomical atlas of the eye, became the first Director of Botanical Gardens in Gottingen, Germany, and for whom the central retinal artery is named).

**Zoysia** grass is also eponymic, having been developed by Austrian botanist Karl von Zois.

The list of common words derived from proper nouns is astonishing and continues to grow. Our automobiles, including the Buick, Cadillac, Chevrolet, Pontiac, Ford, Oldsmobile, and Chrysler, are all named after people. The **diesel** engine is named for the German engineer who invented it, Dr. Rudolf Diesel. The **Rolls-Royce** is named for two people: Sir Henry **Royce**, who designed the car, and Charles Stewart **Rolls**, champion race car driver (who later became the first Englishman to die in an airplane accident).

In 1901, the Daimler company named their fashionable automobile for the daughter of their largest car dealer. Her name was **Mercedes** Jellinek.

And the cognoscenti of the National Rifle Association (NRA) should be able to tell you that Colt, Browning, Smith and Wesson, Thompson, Derringer, Winchester, Carbine, Maxim, and Mauser are all eponyms for their inventors. The Gatling gun, or "gat" as Bogart liked to refer to it, was one as well. So, too, was the **Minnie Ball** -- made famous during our Civil War. It was invented by a French army captain, Claude Etienne **Minie**.

Indeed, **shrapnel** itself was invented by British Second

Lieutenant Henry Shrapnel in 1783. (Flak, in case you were interested, is not an eponym. It is a German acronym devised during WWII. It stands for **F**lieger **A**bwehr **K**anone -- flier defense cannons.)

William Shakespeare asked: "What's in a name? That which we call a rose, by any other name, would smell as

sweet." Eponyms, names of forgotten people and ancient places -- word fossils of mankind's yesterday -- will surely embellish and enrich our speech forever.

As we verbalize, pontificate, babble, prattle, mutter, and mumble, we often bear silent, unrecognized witness to those lives which might otherwise have passed forgotten. ■

**"As doctors, if we do the right thing at the right time we can make a difference."**

Dr. Kenneth A. Haller, Pediatrician, East St. Louis, Illinois,  
Member, American Medical Association

In one of the nation's poorest communities, Dr. Kenneth Haller is working not only to save children's lives, but to bring dignity to the lives of their parents.

He is the type of physician who brings distinction to our profession. He is the type of physician who upholds the highest ideals of medicine. He is also a member of the American Medical Association (AMA).

"I read the Principles of Medical Ethics of the AMA and was impressed by it. I'm proud to be a member," says Dr. Haller.

You are invited to join Dr. Haller and to join with him in his efforts to bring quality health care to those in need. Become a member of the American Medical Association today.

**American Medical Association**

Physicians dedicated to the health of America

*Robert Wagner Gibson MD*, the President and Chief Executive Officer of Sheppard and Enoch Pratt Health System in Towson, has been elected to the Executive Council of the Maryland Hospital Association (MHA). A graduate of the University of Pennsylvania Medical School, he is an internationally known psychiatrist and mental health advocate who has served as a visiting professor and lecturer at dozens of colleges and universities nationwide. Long active in many national organizations, he has held leadership positions with the American Psychiatric Association, the American Association of Psychiatric Administrators, the American Hospital Association, and the National Association of Private Psychiatric Hospitals. Dr. Gibson's numerous career honors include awards or citations from the Institute of the Pennsylvania Hospital, the Long Island Jewish-Hillside Medical Center, Lesley College, the American Society of Physician Analysts, the American College of Psychiatrists, the National Association of Private Psychiatric Hospitals, and the Mental Health Association of Metropolitan Baltimore; Mayor William Donald Schaefer designated June 10, 1986 as "Dr. Robert W. Gibson Day" in Baltimore. A prolific author, Dr. Gibson has been a consultant to a host of state and federal government organizations and to private industry.

*Martin D. Weltz MD, FACP* of Columbia, MD recently received a three-year appointment as Cancer Liaison Physician for the Cancer Program at Greater Laurel-Beltsville Hospital. (The Cancer Liaison Program is an integral part of the Commission on Cancer of the American College of Surgeons.) Dr. Weltz is among a national network

of over 2,000 volunteer Cancer Liaison Physicians who provide leadership and support to the Hospital Cancer Program, and other Commission on Cancer Activities. Dr. Weltz, who has a significant interest in the diagnosis and treatment of patients with malignant disease, also provides local leadership for the national clinical goal of the Cancer Liaison Program, which is the utilization of tumor node metastases staging.

*James J. Ryan MD* has been appointed Chief of Plastic Surgery for The Children's Hospital and Center for Reconstructive Surgery, Inc. Dr. Ryan has served on the Hospital's medical staff for seventeen years. With specialization in breast and aesthetic surgery, he is a Diplomate of the American Board of Surgery and the American Board of Plastic Surgery. Dr. Ryan received his General Surgery Training at Boston's Massachusetts General Hospital and his Plastic Surgery training at The Johns Hopkins Hospital.

*John David Reeder MD* was recently elected Vice President of the Maryland Radiological Society. Co-director, MRI/CT, Whitesquare Imaging and Magnetic Imaging Associates in Baltimore, Dr. Reeder is also an attending Radiologist at both Franklin Square and Kernan Hospitals. He received his BA (magna cum laude, Phi Beta Kappa) in Biology from Wake

Forest University in North Carolina and his MD from the University of Maryland School of Medicine (Dr. J. Bradley Prize for Excellence in Pediatrics). Author of more than twenty-five articles, he is also an accomplished speaker. Married with three children, he holds academic appointments at The Johns Hopkins University School of Medicine, Department of Radiology and Radiological Science; the University of Maryland School of Medicine, Department of Diagnostic Radiology; and the Maryland Institute of Ultrasound Technology, Neurosonography Section. He is active on several committees at Franklin Square Hospital, is a member of numerous professional societies, and is a member of the Major Medical Equipment Advisory Panel for the State of Maryland.

# Continuing...

For over fifteen years, the Med Chi Agency has been serving the needs of Maryland physicians...*your* needs, with unrivaled commitment and dedication. And as the Agency has grown, so has your trust...in us, in our products and in the way we do business with you.

As a comprehensive insurance agency, we are able to offer a wide range of insurance and financial options. Among these are:

Professional Liability Insurance (Malpractice)

Personal insurance, including homeowners, auto, boat and recreational vehicle coverage and personal umbrella insurance.

Office insurance, including medical equipment, medical records, computer equipment, account receivables, workers compensation, business auto and employee dishonesty

Financial and estate planning, specifically tailored to the medical professional.

Individual and group, life, health and income protection.

Qualified and non-qualified Retirement Planning

## ...A Commitment To Service

**THE MED CHI AGENCY**  
1204 Maryland Avenue  
Baltimore, Md. 21201-5583  
(301) 539-6642  
1-800-543-1262 (in Maryland)  
FAX (301) 752-5421

Manuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

## Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a WordPerfect or ASCII format.

Include full name of author(s) with highest degrees and academic or professional titles.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

An introductory synopsis of approximately twenty-five to fifty words is required.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to twenty in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see *Uniform Requirements for Manuscripts Submitted to Biomedical Journals* compiled by the International Committee on Medical Journal Editors (available through the *Annals of Internal Medicine*).

Permission: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the principal author and *MMJ*.

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset. ■

*Clinical Neuro-Ophthalmology*. Neil R. Miller. 4th Edition. Volume 4. Baltimore: Williams & Wilkins, 1991. 2,820 pages. \$120.00

Dr. Frank B. Walsh published the first edition of this series in 1947. It was based on his experiences at the Wilmer Institute of The Johns Hopkins Medical Institutions with Dr. Walter B. Dandy. It was and is a classic, establishing the specialty of neuro-ophthalmology. Dr. William F. Hoyt of the University of California expanded this great book with Dr. Walsh. The third edition was published in 1969.

Dr. Miller, who worked under Dr. Walsh, is an acknowledged world leader in neuro-ophthalmology and a professor in the Department of Neuro-ophthalmology at Johns Hopkins. This volume is devoted entirely to vascular disorders that produce neuro-ophthalmologic signs and symptoms. Three preceding volumes deal with tumors, nervous systems of the eyes, and optic nerve disorders. Chapter headings in this volume include anatomy, physiology, aneurisms, fistulas, cerebrovascular disease, migraine vasculitis, and venous occlusive disease.

This edition is even better illustrated than the previous three with photographs and diagrams of case studies of the various disorders; explanations of the figures are very understandable. It is well-written with helpful subject headings. The references are extensive and are noted in the text so as to make clinical information easy to find.

There is no other source of information acquired from so many years of experience which is laid out as if the patient were in front of the physician in the Osler tradition. The book is appropriate for neurologists, neurosurgeons, ophthalmologists, and all medical libraries, and would be of interest to any physician. Its cost is reasonable compared to such volumes in other fields. It will not be superseded soon.

HENRY B. WILSON MD  
Baltimore

## Physician Placement Services

**The Medical and Chirurgical Faculty of the State of Maryland** maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service  
1211 Cathedral St., Baltimore, MD 21201  
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service*. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

*MMJ* announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

## DIRECTOR OF MEDICAL EDUCATION AND MEDICAL AFFAIRS

Prince George's Hospital Center, the 450 bed flagship hospital of Dimensions Health Corporation in Cheverly, Maryland is seeking a physician executive to be a moving force behind our commitment to quality, community and education.

Located in suburban Washington, D.C., the Hospital Center serves a diverse metropolitan community, providing care that includes a Level I Shock Trauma Unit, Comprehensive Cardiology (inclusive of invasive cardiology and open heart surgery), a Level II Neonatal Nursery, and a variety of graduate medical education programs.

The successful candidate will be a board certified physician, with the integrity, maturity, diplomacy and tact needed to be a member of the Hospital Center's senior management staff, acting as liaison between the Medical Staff, Administration, and Board.

Responsibilities include the administration of the office of medical affairs and establishing new directions for the medical education and quality assurance programs. Compensation is competitive and inclusive of a comprehensive salary, clinical income and fringe benefit package.

Candidates ideally will have conducted a community-based medical practice and have a demonstrated record of administrative leadership and clinical accomplishment. Interested applicants should submit a resume and statement of interest by November 15 to:

**Chief Executive Officer**  
**Prince George's Hospital Center**  
3001 Hospital Drive  
Cheverly, Maryland 20785

*Healthcare Above the Standard.*

**PRINCE GEORGE'S HOSPITAL CENTER**

3001 Hospital Drive, Cheverly, Maryland 20785 (301) 618-2264

An affiliate of Dimensions Health Corporation.  
A not-for-profit community health system.

# The experience of a nationwide laboratory.

Wouldn't it be great if you could enjoy all the advantages of a nationally—  
accredited testing laboratory—right here in your own neighborhood?

Well, now you can.

- The nation's largest full-service clinical laboratory network
- Over 25 years experience in laboratory toxicology
- Accredited by the College of American Pathologists (CAP)
- Licensed by the U.S. Department of Health and Human Services

**SmithKline Beecham**  
*Clinical Laboratories*  
*Maryland*

**800-729-7525**

- Local courier network works on your schedule around the clock
- 24-hour turnaround time on most routine tests
- Extensive internal quality control program ensures the accuracy you need to prescribe proper treatment for your patients
- A commitment to serve and serve well.

# The convenience of a local lab.

# COMING OUT OF THE DARK

Med Chi's Physician Rehabilitation Committee deals with the substance abuse and mental health problems of Maryland physicians, with a confidential and nondisciplinary focus...Addiction, Marital/Family Conflicts, Psychiatric Illness, Organic Impairment, Physical Handicap...If these problems exist, we can help find the solution. Call us.

The Physician Rehabilitation Committee of Med Chi is available to all Maryland physicians, and their families.

The Committee is NONDISCIPLINARY and information is kept CONFIDENTIAL. If you, a colleague, or family member is in need of our services call (301)962-5580 or call toll free (800)992-7010, or leave a message 24 hours a day, 7 days a week at (301)727-1020.

*HELPING IS OUR BUSINESS...All donations to the Physician Rehabilitation Committee are used for the delivery of services to Maryland physicians in need of help. If you wish to help further the work of the Committee through a tax deductible donation send your check to: The Medical and Chirurgical Faculty Charitable/Educational Foundation, 1204 Maryland Avenue, Baltimore, Maryland 21201 Please note on your donation: "Physician Rehab"*

Spouses of deceased members shall be entitled to two complimentary insertions for the disposal of the deceased physician's practice or equipment. Ad cancellations must be received in writing seven weeks prior to the first of the month.

Send box replies or new ad copy to: MMJ, 1211 Cathedral St., Baltimore, MD 21201 or FAX 301-547-0915. Invoices are sent after the ad is published.

### MEDICAL LABORATORY FOR SALE

Due to increasingly restrictive Medicare and federal regulations, a group of physicians in the State of Maryland is offering a clinical medical laboratory for sale. Located in Annapolis, MD, the laboratory is a completely independent state-licensed facility with a sizable patient workload. The physicians' group may be willing to trade with a comparable laboratory finding itself in the same position. Please send all inquiries to: Laboratory Manager, Weems Creek Medical Laboratory, Inc., 600 Ridgely Ave., Suite 123, Annapolis, MD 21401.

### MOBILE NUCLEAR MEDICINE

Mobile SPECT services are now available to group practices throughout Maryland. Great way to maximize your revenues! We provide a choice of complete turnkey or specific support services. Contact: Raymond White, Harbor Health Care Group, 1 Harbor Ct., Suite 25-D, Portsmouth, VA 23704. 1-800-373-2556. ■

# A MEDICAL TEST SHOULD **NOT** SCARE PEOPLE HALF TO DEATH!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS™ MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 400 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At the Greater Baltimore MRI Center, Inc., we make it easier for you to diagnose your patients' problems.

## It's A Closed Box.

Simply put, your Medical Mutual premiums go into a closed box . . . and you own the box. We pay claims, we pay to defend physicians, we pay operating expenses. Any money left over belongs to you. That's it. No money goes to out-of-state owners, no money goes to subsidize operating expenses of a parent company located in another state. Dividends are paid to you, not to outside stockholders.

The physicians of Maryland planned it this way when you asked the Maryland General Assembly to create Medical Mutual to meet your special insurance needs. It's a concept that has worked well for over 15 years, and it's a concept that has made Medical Mutual the choice of the vast majority of physicians across the state.

The closed box. We're the only ones who operate this way. Why accept anything less?

## Making the right choices means asking the right questions.

You know the questions to ask your patients. Questions that will provide the information you need to make an informed decision about medical treatment.

When it comes to choosing a medical malpractice insurer, knowing which questions to ask--and how to interpret the answers--is no less important. Because just as your treatment decisions may have a lasting impact on your patient's long-term health, your choice of insurer may make all the difference to your professional and financial well-being in the years ahead.

In an uncertain medical situation, you might consult a specialist. When you're making decisions about insurance, why not consult with an insurance specialist? An expert who can suggest which

questions to ask, guide you through the technical jargon, and help you select the coverage that's right for you.

That's where Princeton's network of independent insurance agents comes in. Our agents understand the insurance needs of health care professionals. They'll show you how to compare costs and benefits, and help you avoid gaps or duplications in coverage.

Do ask an agent why Princeton should be your choice. Ask about our financial strength, about our claims management philosophy that vigorously defends physicians against meritless claims...and about our new office package policy that offers protection for your practice and premises. We think you'll like the answers.

Predicting Severe Coronary Disease . . . . . 1079**

*Romulo F. Baltazar MD, FACP, FACC, Albert Grant MD, Vicki O'Mara RN and Mark B. Effron MD*

In a study of eighty-one patients with a positive stress test who underwent coronary angiography, the results showed that a positive test at warm-up or Stage I of the Bruce protocol is usually a sign of severe coronary disease, although patients with less severe disease may also be included.

# Maryland's newest physical rehab center already has 20 years experience.

Baltimore is a city known internationally for its outstanding medical care. Now the tradition continues with the addition of the new Maryland General-Bryn Mawr Rehab Center at Maryland General Hospital. This specialty center for physical medicine and rehabilitation offers Bryn Mawr Rehab's 20 years of experience and leadership in the field of rehabilitation medicine.

The partnership between Maryland General Hospital and Bryn Mawr Rehab is truly unique. For the first time in Maryland, two high quality institutions with long histories of health care achievement are coming together to make a major commitment to rehabilitation medicine.

The Maryland General-Bryn Mawr Rehab Center, the region's most modern and conveniently located rehabilitation facility, provides a continuum of care in physical and cognitive rehabilitation services

including brain injury, stroke, orthopedics, arthritis, amputee services and multiple sclerosis, among others.

Most importantly, everyone on the Maryland General-Bryn Mawr Rehab team is personally and professionally dedicated to helping patients reach their highest level of independence. Our guiding philosophy is team-centered care, focused upon the individual needs of our patients and their families. This is what makes Maryland General-Bryn Mawr Rehab Center a very special place for rehabilitation care.

To learn more about Maryland General-Bryn Mawr Rehab Center or to arrange a tour, please call Mary Filippelli our administrative director at (301) 225-8380.

Maryland General-Bryn Mawr Rehab Center.  
We're the new team in town with lots of experience.

The recommended starting dose for Calan SR is 180 mg once daily. Dose titration will be required in some patients to achieve blood pressure control.

A lower initial starting dosage of 120 mg/day may be warranted in some patients (eg, the elderly, patients of small stature).

Constipation, which is easily managed in most patients, is the most commonly reported side effect of Calan SR.

#### BRIEF SUMMARY

**Contraindications:** Severe LV dysfunction (see *Warnings*), hypotension (systolic pressure < 90 mm Hg) or cardiogenic shock, sick sinus syndrome (if no pacemaker is present), 2nd- or 3rd-degree AV block (if no pacemaker is present), atrial flutter/fibrillation with an accessory bypass tract (eg, WPW or LGL syndromes), hypersensitivity to verapamil.

**Warnings:** Verapamil should be avoided in patients with severe LV dysfunction (eg, ejection fraction < 30%) or moderate to severe symptoms of cardiac failure and in patients with any degree of ventricular dysfunction if they are receiving a beta-blocker. Control milder heart failure with optimum digitalization and/or diuretics before Calan SR is used. Verapamil may occasionally produce hypotension. Elevations of liver enzymes have been reported. Several cases have been demonstrated to be produced by verapamil. Periodic monitoring of liver function in patients on verapamil is prudent. Some patients with paroxysmal and/or chronic atrial flutter/fibrillation and an accessory AV pathway (eg, WPW or LGL syndromes) have developed an increased antegrade conduction across the accessory pathway bypassing the AV node, producing a very rapid ventricular response or ventricular fibrillation after receiving I.V. verapamil (or digitalis). Because of this risk, oral verapamil is contraindicated in such patients. AV block may occur (2nd- and 3rd-degree, 0.8%). Development of marked 1st-degree block or progression to 2nd- or 3rd-degree block requires reduction in dosage or, rarely, discontinuation and institution of appropriate therapy. Sinus bradycardia, 2nd-degree AV block, sinus arrest, pulmonary edema and/or severe hypotension were seen in some critically ill patients with hypertrophic cardiomyopathy who were treated with verapamil.

**Precautions:** Verapamil should be given cautiously to patients with impaired hepatic function (in severe dysfunction use about 30% of the normal dose) or impaired renal function, and patients should be monitored for abnormal prolongation of the PR interval or other signs of overdose. Verapamil may decrease neuromuscular transmission in patients with Duchenne's muscular dystrophy and may prolong recovery from the neuromuscular blocking agent vecuronium. It may be necessary to decrease verapamil dosage in patients with attenuated neuromuscular transmission. Combined therapy with beta-adrenergic blockers and verapamil may result in additive negative effects on heart rate, atrioventricular conduction and/or cardiac contractility; there have been reports of excessive bradycardia and AV block, including complete heart block. The risks of such combined therapy may outweigh the benefits. The combination should be used only with caution and close monitoring. Decreased metoprolol and propranolol clearance may occur when either drug is administered concomitantly with verapamil. A variable effect has been seen with combined use of atenolol. Chronic verapamil treatment can increase serum digoxin levels by 50% to 75% during the first week of therapy, which can result in digitalis toxicity. In patients with hepatic cirrhosis, verapamil may reduce total body clearance and extrarenal clearance of digoxin. The digoxin dose should be reduced when verapamil is given, and the patient carefully monitored. Verapamil will usually have an additive effect in patients receiving blood-pressure-lowering agents. Disopyramide should not be given within 48 hours before or 24 hours after verapamil administration. Concomitant use of flecainide and verapamil may have additive effects on myocardial contractility, AV conduction, and repolarization. Combined verapamil and quinidine therapy in patients with hypertrophic cardiomyopathy should be avoided, since significant hypotension may result. Concomitant use of lithium and verapamil may result in a lowering of serum lithium levels or increased sensitivity to lithium. Patients receiving both drugs must be monitored carefully. Verapamil may increase carbamazepine concentrations during combined use. Rifampin may reduce verapamil bioavailability. Phenobarbital may increase verapamil clearance. Verapamil may increase serum levels of cyclosporin. Verapamil may inhibit the clearance and increase the plasma levels of theophylline. Concomitant use of inhalation anesthetics and calcium antagonists needs careful titration to avoid excessive cardiovascular depression. Verapamil may potentiate the activity of neuromuscular blocking agents (curare-like and depolarizing); dosage reduction may be required. Adequate animal carcinogenicity studies have not been performed. One study in rats did not suggest a tumorigenic potential, and verapamil was not mutagenic in the Ames test. Pregnancy Category C. There are no adequate and well-controlled studies in pregnant women. This drug should be used during pregnancy, labor, and delivery only if clearly needed. Verapamil is excreted in breast milk; therefore, nursing should be discontinued during verapamil use.

**Adverse Reactions:** Constipation (7.3%), dizziness (3.3%), nausea (2.7%), hypotension (2.5%), headache (2.2%), edema (1.9%), CHF, pulmonary edema (1.8%), fatigue (1.7%), dyspnea (1.4%), bradycardia: HR < 50/min (1.4%), AV block: total 1°, 2°, 3° (1.2%), 2° and 3° (0.8%), rash (1.2%), flushing (0.6%), elevated liver enzymes, reversible non-obstructive paralytic ileus. The following reactions, reported in 1.0% or less of patients, occurred under conditions where a causal relationship is uncertain: angina pectoris, atrioventricular dissociation, chest pain, claudication, myocardial infarction, palpitations, purpura (vasculitis), syncope, diarrhea, dry mouth, gastrointestinal distress, gingival hyperplasia, ecchymosis or bruising, cerebrovascular accident, confusion, equilibrium disorders, insomnia, muscle cramps, paresthesia, psychotic symptoms, shakiness, somnolence, arthralgia and rash, exanthema, hair loss, hyperkeratosis, macules, sweating, urticaria, Stevens-Johnson syndrome, erythema multiforme, blurred vision, gynecomastia, galactorrhea/hyperprolactinemia, increased urination, spotty menstruation, impotence.

## With Malpractice Insurance Premiums on the rise, why settle for anything less than the best available coverage?

The downward trend in malpractice insurance premiums has broken and prices are on their way back up. Should a physician choose between insurers only on price? Of course not. But there are a number of quality choices between carriers and products. You should get the most from your premium dollars.

Let us compare the available products and prices for you. There is no charge or obligation. For written quotations and comparisons call us or send us a copy of your malpractice policy. Let us show you why hundreds of Maryland physicians rely on us for their malpractice coverage. You need a broker you can rely on.

### **Occupational Disease Registry and 1990 Annual Report Maryland Department of the Environment**

#### **History and Development**

Occupational diseases have been reportable in Maryland since 1912. In previous years, the Department of Health and Mental Hygiene (DHMH) received these reports through its confidential morbidity reporting system, which was mainly used for communicable diseases. Government reorganization on July 1, 1987, gave the responsibility for the occupational disease reporting system to the Maryland Department of the Environment (MDE). The law requires that physicians who believe that patients under their care have an occupational disease shall submit a report to the MDE. These reports must include the patient's name, address, occupation, and place of employment; identify the suspected disease; and contain other pertinent information as needed. MDE is required to give the information received under this action to the Commissioner of Labor and Industry (Environment Article, Section 6-702 Annotated Code of Maryland).

In 1990, MDE developed a new confidential occupational disease reporting card (MDE-223, Figure 1). This new card and the guidelines (found on the last page of this article) were sent to over 300 physicians and occupational health facilities across the state. As

a result of these efforts, reporting has significantly improved. The physician-based Occupational Disease Registry is maintained by the MDE's Environmental Health Program, Health Registries Division.

#### **Reporting Procedures and Actions**

MDE's Occupational Disease Registry has been set up to monitor workers' exposure to working conditions/substances that may adversely affect their health. Conditions with short latency periods (e.g., occupational asthma, and heavy metal and pesticide poisoning) are of particular importance, since they are amenable to preventive and/or corrective action.

These cases are promptly referred to Maryland Occupational Safety and Health (MOSH) for worksite investigation. Reports on employees of the federal government are referred to the Occupational Safety and Health Administration (OSHA). Consultative services are available for self-employed workers through MOSH, MDE and/or private consulting firms.

Conditions with long latency periods which are not responsive to corrective action, (e.g., asbestosis) are monitored to determine the ex-

tent of the problem and to evaluate the effectiveness of control measures over time. All reported cases are maintained in a computerized database for trend analysis and periodic summarization.

### Highlights: 1990 Reports

In 1990, MDE received 133 reports of occupational diseases (Table 1).

All but one reported case were male; 69% were white. Ages ranged from 23-84 years, with a median of 58 years.

Baltimore City and the surrounding counties of Anne Arundel, Baltimore, and Prince George's accounted for 88 (66.2%) cases.

Asbestos-related conditions were the most frequently reported, accounting for 97 (72.9%) cases. Forty-seven (48.5%) of these cases were reported from Primary Metal Industries. There were 14 (10.5%) reports of lead poisoning, 12 of which were from the Construction industry.

The most frequently reported occupations were welders and cutters (20 cases), laborers

(17 cases), machine operators (13 cases) and plumbers (8 cases). More than 85% of these cases involved asbestos-related jobs.

*Submitted by Maryland Department of the Environment, Health Registries Division*

*Season's Greetings*

# MARYLAND DEPARTMENT OF THE ENVIRONMENT

## OCCUPATIONAL DISEASE REPORTING GUIDELINES

Government reorganization on July 1, 1987 gave the statutory authority for the surveillance of occupational diseases and receipt of reports to the Maryland Department of the Environment (MDE). These data are made available to the Maryland Department of Health and Mental Hygiene and Commissioner of Labor and Industry as required by law.

### 1. Who should report ?

Environment Article, 6-702 requires that physicians who believe that patients under their care have an *occupational disease* shall submit a report to the MDE. A designated member of the staff may also report, but the physician retains the legal responsibility.

### 2. How should reports be made ?

The confidential occupational disease reporting card (MDE-223) should be used for all reports. Additional cards are available upon request. A log format is also available for physicians with large caseloads.

### 3. When should reports be made?

Reports should be made upon diagnosis, even if the onset of the condition or exposure to the toxic substance occurred several years earlier.

### 4. What is an occupational disease?

An occupational disease is any illness or adverse health condition which is caused by or worsened by working conditions.

### 5. What are examples of occupational disease?

It is important that all occupational diseases be reported so that areas of risk can be properly identified. The following are of particular interest to the MDE because they are more amenable to preventive and corrective action:

**Respiratory :** asbestosis, silicosis, other pneumoconioses, and occupational asthma.

**Occupational-related cancer :** leukemia, mesothelioma, and bladder cancer.

**Toxics-related :** adverse health effects associated with heavy metals, pesticides, hazardous chemicals.

**Physical hazards :** adverse health effects associated with heat, cold, radiation, noise.

**Other conditions :** such as blood dyscrasia and gas intoxication.

### 6. What is the responsibility of company physicians?

When a physician is employed by a company, his/her first duty is the protection of the worker's health. The physician, and not the company, carries the legal responsibility to report. This ethical and legal responsibility supersedes any considerations of the physician's relationship to the company.

### 7. What is the purpose of occupational disease reporting?

Prompt, accurate occupational disease reporting will alert public health authorities to unsatisfactory conditions in the workplace. Data received are referred to Maryland Occupational Safety and Health (MOSH) for follow-up. Early identification of problems with subsequent corrective action will prevent further adverse health effects in the exposed worker as well as protect other workers at risk.

### 8. What other services are available to the physician through the MDE ?

The Department offers the following services that may be of benefit to you:

- toxicological and medical information
- occupational medicine referral sources for case management
- periodic reports and updates on occupational health issues
- feedback and follow-up on reported cases
- sponsorship of continuing medical education credits on environmental/occupational health topics.

## Medicine and Public Health in Baltimore During the Early Years of the Sinai Hospital of Baltimore\*

The Sinai Hospital of Baltimore is a unique private institution of which the Jewish community of Baltimore can be justly proud — from the moment the cornerstone was laid 125 years ago for the ten-bed Hebrew Hospital, to its transformation sixty years later (1926) into the nonsectarian Sinai Hospital, and finally to its evolution into an outstanding academic hospital (1952). An institution designed to meet the needs of the Jewish population as well as other Baltimore citizens, it has consistently continued to improve.

Although my own career in medical research began sixty-four years ago while I was still a student in New York City, my activities have never before brought me in contact with the Sinai Hospital of Baltimore. Accordingly, I was somewhat surprised to be invited to be the keynote speaker for the celebration of the 125th Anniversary of its founding. Could it be because my ancestors wandered in the Sinai Desert about 3,200 years ago? Or because forty-eight years ago, I crossed the Sinai Desert from Egypt to Tel Aviv in a jeep in eight hours as a U.S. Army Medical Officer engaged in research on epidemic diseases in the Middle East during World War II? Or could it be because I had recently come to know Dr. Bart Chernow, Physician-in-Chief at the Sinai Hospital of Baltimore? In any case, I accepted the invitation with pleasure, and thereby learned some interesting things, which I would like to share with you, about the history of Baltimore and of its special medical problems during the past 125 years.

From a June 1966 publication of the Women's Auxiliary of Sinai Hospital, I learned about the Baltimore of the mid-nineteenth century. In 1850, Baltimore had a population of 169,000, which by 1866, only a year after the tragic war between the states (I came to use this expression for the Civil War during my eight years of residence in South Carolina), had increased to 300,000. This rapid growth of population was partly the result of immigration from the war-ravaged southern states and partly due to immigration from Europe through Baltimore's fine natural port. A great deal of overseas commerce in foreign ships brought with them smallpox, cholera, yellow fever, malaria, and typhus. "The city, which had been laid out in typical, colonial fashion, with its cobblestone or brick paving, was building more and more row houses, and behind them tiny dwellings to accommodate the Negro newcomers to town . . . Disease in the city, both homegrown and imported, was rampant. Open sewers ran along the curbs, every backyard had a cesspool, and everything emptied into Jones' Falls. The city's water supply came from an artificial lake in Greenspring Valley, and all wastes from the valley emptied into this lake. Consequently, Baltimore had one of the highest typhoid rates of any big city in

the country . . . Philanthropic visionaries were there, too, and from them grew many public services and works such as the Hebrew Benevolent Society and, ultimately, Sinai Hospital."

From a publication by Joseph Gordon entitled *Public Health and the Conquest of Disease in Baltimore . . . 1792 - 1968*, I learned that in 1868, when the Hebrew Hospital first opened its ten beds for indigent patients, tuberculosis was a leading cause of death, along with hundreds of stillbirths, infant deaths from unknown causes, and more than 1,000 deaths per year from cholera infantum. In addition, epidemics of measles, cholera, croup, dysentery, scarlet fever, typhoid, and endemic lobar pneumonia took their toll of life and added to the misery of the living. In 1900, infant mortality in the United States was higher than it is now in most poverty-stricken, economically underdeveloped countries — 160 of every 1,000 liveborn children died before their first birthday and the figures were more than double for black children (over 320 per 1,000). A child born in the United States in 1900 had an average life expectancy of only forty-seven years, compared with about seventy-five at the present time.

From an article entitled "Medicine in Maryland, 1634 - 1900" by Douglas Gordon Carroll, Jr., I learned something about the evolution of medical education in Maryland and what medical practice was like in Baltimore 125 years ago. Before the nineteenth century, most physicians and surgeons in practice in Maryland were trained in the medical schools of Europe. In 1812, when an apprenticeship of a single student with a single doctor was still the most frequent method of medical education, the University of Maryland was created. It recognized Medicine as an intellectual discipline, similar to Law and the Divinity. However, medical education remained a cottage industry with many so-called medical schools that were no more than trade schools.

In 1877, the new *Maryland Medical Journal* had an article by Richard McSherry in which he described medical practice as follows: "The practitioner thought that when he knew something about anatomy, chemistry, and a few drugs, he was able to practice medicine. He could bleed, cup, draw teeth, set broken limbs, and deliver a farmer's wife of triplets. It soon became apparent that some had special gifts for surgery, others in obstetrics. After Laennec's discovery (of the stethoscope), some became more skilled in diseases of the chest. Dr. Bright (1789-1858) opened a new field, and some practitioners grew famous in the knowledge of diseases of the urinary organs." Dr. McSherry concluded with the following prophetic statement: "Specialties have become inevitable."

From the previously mentioned publication by Joseph Gordon, I also learned that:

1. Baltimore had the oldest existing health department in

\*Part of Keynote address at Academic Session for 125th anniversary of the Sinai Hospital of Baltimore, April 27, 1991

the US. It was established in 1792 to prevent the spread of yellow fever from Philadelphia to Baltimore.

2. During the nineteenth century, "the major focus of health department services was concentrated mainly on the sanitation of the environment and prevention of communicable disease by vaccination and quarantine, as the science of the day permitted."
3. In 1890, "Baltimore witnessed the rapid acceptance of the germ theory of disease."
4. By 1900, Baltimore achieved control over malaria and yellow fever by "Improvement of drainage and elimination of standing water in streets, gutters, alleys and cellars." Cholera came under control by "upgrading environmental conditions, the water supply, and the control of insects (flies) and human wastes."
5. "The first two decades of the twentieth century witnessed three fundamental improvements that contributed greatly to Baltimore's health. These were the

establishment of a pure water supply, creation of an adequate sewage disposal system, and the enactment of a strong milk ordinance."

Thus, many of the challenges of poor health in Baltimore were being gradually overcome in the first part of the twentieth century not so much by the increase in knowledge of infectious diseases provided by medical science or by improved medical education, as by a gradual improvement in the standard of living and the associated improvements in nutrition, sanitation, hygiene, and housing.

### Acknowledgments

I want to thank Margaret Kaiser of the National Library of Medicine for locating the historical publications on the Sinai Hospital and on medicine in Baltimore in the nineteenth century and for supplying them to me.

ALBERT B. SABIN MD  
Washington, DC

### Authors Take Heart

Authors naturally desire to share their thoughts about a particular subject with their readers. In any setting, their efforts are frequently rejected by editors but yet the writers persist. Juvenal<sup>1</sup> recognized the presence of this pernicious yet innocuous syndrome early on when he wrote in one of his satires:

Yet we still keep at it, ploughing a dusty furrow,  
Turning the barren sand. You can't get out, you're hooked  
By writer's itch. The craving for bookish renown  
Becomes a sick obsession.

Then, Abelard<sup>2</sup> said it a little differently to Heloise:

Against the disease of writing one must take special precautions, since it is a dangerous and contagious disease.

I wonder how discouraged Edgar Allan Poe and Richard Bach were when their efforts were rejected. Poe suffered a unanimous refusal of *The Raven* by his editors and only saw his work in print in a periodical of which he was the editor.<sup>3</sup>

Nearer to this day, *Jonathan Livingston Seagull* was returned to Bach more than twenty times before acceptance and a place on the bestseller list.<sup>4</sup> So, depressed authors, take heart, raise the dust, live with your disease, and keep sending your best efforts to the editors. If your work has merit, you will see it in print.

## Committee Selection Cards 1992-1993

Med Chi members interested in serving on a Med Chi Committee during the 1992-1993 committee year should complete the committee selection card following this newsletter. All members must complete this card to be considered for appointment.

## Revised Disclosure of Ownership Sign for HMO Participating Physicians

In the September 1991 issue of the *MMJ*, Med Chi published a sign for display in physician offices to help its members comply with a new Maryland law (HO, Sec. 1-206). This law requires physicians to post a notice in their offices regarding their ownership of other health care services to which the physicians refer patients. On the sign published in September 1991, it was not indicated that health maintenance organization (HMO) physicians and subscribers are exempt from the disclosure requirement. To help avoid confusion among your HMO patients, Med Chi is providing a revised sign following this newsletter which indicates that HMO patients must use the facility identified by their HMO.

## Japanese Medical Delegation Visits Med Chi

The Japanese President of the Kanagawa Prefecture Medical Association, Ryohei Kawaguchi MD, and Med Chi President J. David Nagel MD signed an agreement for cooperation, friendship and exchange between Med Chi and the Kanagawa Prefecture Medical Association during the Japanese medical delegation's visit to Med Chi on October 15, 1991. During the visit, over 20 physicians and dentists from the Kanagawa Prefecture met to discuss Maryland's medical system, including information on liability insurance and medical licensure. The agreement and the Kanagawa Prefecture flag, which was presented to Med Chi in honor of this event, are on display in the Med Chi Faculty Building.

## Med Chi Issues and Programs Packets Available

Med Chi is developing packets of information on key medical issues. To date, the following issue and program packets have been adopted or are in the developmental stages:

AIDS	Animal Rights
Council and Executive Committee	Doctor/Lawyer/Teacher Partnership Against
Highlights (May 1990 to May 1991	Drugs Training Packet
and May 1991 to September 1991)	Mammography Standards
Medicaid Provider Fee Project	Medicare - Notice of Proposed Rule Making (NPRM)
Physician Rehabilitation	X-ray Assistants

For a copy of any of the completed information packets, call Med Chi's Communication's Department at 301-539-0872 or 1-800-492-1056.

## Audio Cassette on Safe Harbor Regulations

Med Chi physicians who missed the Emergency Conference on Safe Harbor Regulations on October 11, 1991, can order cassette tapes and working materials from the conference. To order the tapes, see the form following this newsletter.

## Certification of Medical Radiation Technologists and Nuclear Medical Technologists

Physicians are reminded that the Board of Physician Quality Assurance (BPQA) anticipates that the enforcement date of Regulations .01-.11 under COMAR 10.32.10, Certification of Medical Radiation Technologists and Nuclear Medicine Technologists, will be January 2, 1992.

This means that non-physicians may not practice medical radiation technology or nuclear medical technology unless certified or temporarily certified by the BPQA by January 2, 1992. The BPQA in consultation with Med Chi and the Maryland Radiology Society is still required by law to develop a method by which non-certified personnel may continue to take x-rays in a physician's office. The results of work now ongoing will be presented to the Senate Finance Committee and the House Environmental Matters Committee on or before December 1, 1991.

---

## *Mandatory Testing of Health Care Workers*

---

In November, Med Chi began its campaign to educate and reinforce legislators' knowledge of HIV transmission. The campaign consists of three letters that contain information from a study conducted by the Med Chi Committee on AIDS on the implications of the Governor's plan to mandate HIV testing for health care workers. This study includes data that show the low risk of transmission of HIV from physician to patient, projected costs of a mandatory testing program, and several other negative aspects of the proposal.

These letters, which are intended to show the deep concern that Maryland physicians have for the problem of mandatory HIV testing, are being mailed as follows:

Letter #1	- The real risk of HIV transmission	- November
Letter #2	- Projected costs of mandatory HIV testing	- December
Letter #3	- Other arguments against mandatory testing	- January

The letters are also being adapted for use as editorials in various area newspapers. Med Chi physicians are encouraged to write to their Maryland legislators and urge them to oppose mandatory testing of HIV. For a copy of the letters being sent to legislators, contact your component medical society or Betsy Newman, Med Chi Public Relations Director, at 301-539-0872 or 1-800-492-1056.

---

## *President's Regional Conference - Eastern Shore*

---

A Med Chi President's Regional Conference for physicians on the Eastern Shore was held on November 14, 1991 at the Blue Crab restaurant in Cambridge, Maryland. During the conference, Med Chi President J. David Nagel MD presented an update of Med Chi activities; Montgomery County Medical Society President Herman C. Maganzini MD reviewed the AMA's Health Access America proposal; and Richard S. Adler MD gave a CME presentation on "Panic Disorder - A Practical Overview." Med Chi thanks Paul A. Stagg MD who served as Eastern Regional Coordinator for this meeting.

---

## *President's Regional Con- ferences - Southern Md.*

---

The President's Regional Conference for southern Maryland is scheduled for early March 1992. Watch the Executive Director's Newsletter for more information about these conferences or contact Betsy Newman, Public Relations Director, at 301-539-0872 or 1-800-492-1056.

---

## *Doctor/Lawyer/ Teacher Partnership*

---

Physicians in Baltimore City and Harford County are urgently needed to prevent drug abuse in Maryland's school children. As a physician volunteer in the Doctor/Lawyer/Teacher Partnership Against Drugs, physicians will spend a few hours of their time to visit a classroom of students and discuss medical dangers of using drugs. Training sessions will be held on Tuesday, January 14 and Wednesday, January 22, 1992 from 6 to 8 pm in the Med Chi Faculty Building for physicians interested in participating in this program. To volunteer or for more information, contact Betsy Newman, Public Relations Director, at 301-539-0872 or 1-800-492-1056.

---

## *Total Support for H.R. 3070*

---

The physicians in Maryland are to be congratulated. Because of your efforts, all eight Maryland U.S. Representatives have become cosponsors of H.R. 3070. This bill, which was introduced by Representative Pete Stark (D-Cal.), would impose a legislative solution that will achieve all of medicine's basic objectives on the conversion factor. Furthermore, the bill sends a strong message to the Health Care Financing Administration (HCFA) that its conversion factor proposals are unacceptable.

This is the first time that all eight Maryland U.S. Representatives have joined forces on an issue that means so much to the citizens and physicians of Maryland. On behalf of Maryland's physicians, Med Chi expresses its sincere appreciation to our state Representatives for their efforts to assure that physician payment reform is implemented in the way Congress intended.

---

## *Annual Meeting*

---

Med Chi's 1992 Annual Meeting will be held Thursday-Saturday, April 30 - May 2, at the Omni International Hotel in Baltimore. AMA Trustee Thomas R. Reardon MD recently accepted Med Chi's invitation to be a featured speaker at the meeting. Watch the Executive Director's Newsletter for more meeting and program information.

---

## Performing Arts Medicine Conference

---

---

## Recent HMO Billing Developments

---

"Performing Arts Medicine: Issues in Diagnosis and Management," a conference sponsored by Med Chi's Committee on Medicine and the Performing Arts will be held January 24-25 in the Med Chi Faculty Building. For more information about this conference, contact Susan Harman at 301-539-0872 or 1-800-492-1056. Information and a registration form are on pages 1094-1095 of this MMJ.

Physicians should be aware of recent developments in the law that impact on their ability to collect payments for services to members of health maintenance organizations (HMOs). Particular problems have arisen when the physician is not under contract with the HMO, but provides services to HMO members on a referral basis. Since physicians are not allowed to bill HMO members directly, they must deal only with the HMO, which may attempt to delay or deny full payment.

Since 1989, health care providers have been prohibited from collecting or attempting to collect from HMO enrollees any money owed to the provider for "any covered services to the enrollee or subscriber."<sup>1</sup> A new law, which became effective July 1, 1991, requires the HMO to pay the provider for services to an enrollee when pre-authorized or referred by the HMO or a participating provider. Should the enrollee be liable for any of the charges, the HMO may then seek reimbursement from its enrollee.

One aspect of the new law has caused a great deal of confusion since it went into effect. An HMO is now required to pay the provider promptly "at the rate billed or at the usual, customary, and reasonable rate."<sup>2</sup> The option to pay at the usual and customary rate (UCR) has been interpreted by some HMOs to allow payment at a rate that is significantly lower than the amount billed by the provider. The Maryland Insurance Division has notified HMOs that it is "not acceptable to limit the [UCR] to the rate which is negotiated between the HMO and the HMO's providers."<sup>3</sup> By definition, the rate that an HMO pays its participating providers is a rate which is discounted from the customary charge. The Insurance Division has told HMOs to "cease such practice immediately [and] make the necessary adjustments to any provider's bills which have been reduced through this action."<sup>3</sup>

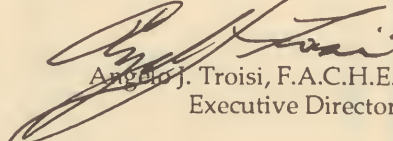

Since some HMOs have seized upon the apparent ambiguity in the law to reduce payments to providers, legislation may be necessary to clarify that the provider should be paid at his or her usual or customary rate. In the meantime, however, physicians and others may be required to take some HMOs to court in order to collect their fees. Some physicians are preparing claims and have retained legal counsel to collect what is owed under a breach of contract theory. Referral of a patient or authorization for care may be considered a direct oral or written contract for services between the HMO and the physician under which the HMO implicitly agrees to pay the provider's charge in return for services to an enrollee. Where an HMO arbitrarily reduces the amount of the fees to the provider, the HMO may have breached its agreement and a court may hold the HMO liable for the full charge. For more information, call Med Chi's Legal Department at 301-539-0872 or 1-800-492-1056.

---

## President's Letter on the Credentialing Process

---

Following this newsletter is a letter from Med Chi President J. David Nagel MD that describes the history of Healthcare Credentials Verification, Inc. and its efforts to streamline the credentialing process. It also dispells some rumors concerning the application process. For questions about this or the credentialing process, contact Betsy Newman, Public Relations Director, at 301-539-0872 or 1-800-492-1056.

Angelo J. Troisi, F.A.C.H.E.  
Executive Director

# The President's Letter

Prepared by the President of the Medical and Chirurgical Faculty of Maryland as a service to its members

Medical  
and Chirurgical Faculty  
of Maryland

November 5, 1991

Dear Colleague:

The Med Chi Faculty is strongly committed to providing a service to the physicians of Maryland through Healthcare Credentials Verification, Inc. (HCV).

HCV is a not-for-profit joint initiative created by Med Chi and the Maryland Hospital Association (MHA) to help physicians and hospitals be in compliance with the 1988 law mandating an expanded, more complex medical staff credentialing process. It has become the first statewide cooperative effort of its kind in the nation — one which may become a national model reflecting very favorably on our state's physicians and health care facilities.

Because HCV is recognized as a medical review organization under Maryland law, its files and records cannot be subpoenaed for use in professional liability cases. By using HCV, a physician's appointment or reappointment to a hospital's medical staff can be accomplished quickly and economically in a confidential manner.

Rumors have been circulated that the HCV processing of applications has been fraught with many unnecessary delays. It is true that recently, physicians did not submit applications in a prompt manner as anticipated, but instead waited until the deadline submission date which created a large backlog of applications. It was through the cooperative efforts of Med Chi and the MHA that this backlog was rapidly reduced and the process returned to normal.

It is my pleasure to report that HCV is operating in an efficient manner, that our working relationship with the MHA is strong and productive, and that Maryland physicians and Med Chi can point with pride to being part of an innovation that is helping to ensure the quality of care we provide to our patients.

HCV stands ready to answer any questions you may have on this subject and to meet with local medical societies, specialty groups and others. Your support of this extremely worthwhile endeavor through your cooperation and prompt response to HCV correspondence is very much appreciated.

Sincerely,

A handwritten signature in dark ink, appearing to be "J. David Nagel", written over a horizontal line.

J. David Nagel MD  
President

# TO MY PATIENTS

When I refer you to a specific health care facility for medical tests or services, you may go to that facility or any other\* to have the tests or services completed. As you make this decision, I want you to know that I or members of my immediate family own a business interest in the following health care facilities:

---

Please feel free to ask me any questions you may have about your care. I am always interested in your continued good health.

---

Physician's Signature

\* (unless you belong to an HMO and your plan requires that you use a particular facility.)

## ***MARYLAND LAW REGARDING NOTICE OF OWNERSHIP OF OTHER HEALTH CARE SERVICES***

Effective July 1, 1991, Maryland law requires physicians to post a notice in their offices regarding their ownership of other health care services to which the physician refers patients. (see back)

The law, which is outlined in Section 1-206 of the Health Occupations Article of the Annotated Code of Maryland, states in part:

A health care practitioner may refer a patient or direct an employee of the practitioner to refer a patient to a health care service in which the practitioner, the practitioner's immediate family, or the practitioner in combination with the practitioner's immediate family owns a significant beneficial interest, if prior to the referral the practitioner:

- (I) Except if an oral referral is made by telephone, provides the patient with a written statement that:
  - 1. Discloses the existence of the ownership of the significant beneficial interest;
  - 2. States that the patient may choose to obtain the health care service from another provider of the health care service; and
  - 3. Requires the patient to acknowledge in writing receipt of the statement;
- (II) Except if an oral referral is made by telephone, inserts in the medical record of the patient a copy of the written acknowledgement;
- (III) Displays a written notice that is plainly visible to the patients of the practitioner disclosing all of the health care services:
  - 1. In which the practitioner, the practitioner's immediate family, or the practitioner in combination with the practitioner's immediate family owns a significant beneficial interest; and
  - 2. To which the practitioner refers patients; and
- (IV) Documents in the medical record of the patient that:
  - 1. A valid medical need exists for the referral; and
  - 2. The practitioner has disclosed the existence of the significant beneficial interest to the patient.

Conference proceedings on tape

# How to Structure Health Care Joint Ventures Under the Safe Harbors

Get expert guidance to comply with the Safe Harbor regs on physician investments in the convenience of your home, car or office. Find out how to...

- ✓ Determine fair market value in equipment and lease contracts
- ✓ Structure joint ventures that meet strict new legal tests
- ✓ Meet the "60-40" investment and revenue requirements
- ✓ Assess the impact of Maryland Senate bill 169
- ✓ And much, much more...

Dear Med Chi Member,

Don't panic about the new restrictions on physician investments -- prepare. Get down-to-earth guidance on what the regs require and how to comply from two of the nation's most respected health care attorneys.

Med Chi members save \$25 on the six audio cassette tapes from our top-rated Emergency Conference on the Safe Harbors. Plus, you get working materials, a copy of the Final Safe Harbor regulations and a FREE bonus tape (see below).

You won't find better guidance on joint venture law anywhere. Our speakers have years of experience advising providers on the ins and outs of anti-kickback law -- and they speak in plain English. After listening to these tapes, you'll understand how the safe harbor regs work and how they affect your business arrangements.

Complete and return the Request Form on the the reverse to get proven, practical answers to your Safe Harbor questions.

 **Medical and Chirurgical Faculty of Maryland**

## Special bonus for Med Chi members!

Get the audio cassettes from the Emergency Conference on the Safe Harbors and receive this FREE extra tape -- "The Enforcement Agency Speaks Out."

Jim Cottos, the Regional Inspector General in Atlanta, tells what types of physician joint ventures HHS will -- and will not -- investigate. Get straightforward answers from this candid enforcement official, and a true sense of the government's intent behind anti-kickback legislation.

More details on reverse ►

# The Safe Harbor audio cassettes include all this....

## Listen to leading health care attorneys explain in plain English how to:

- ✓ Qualify for Safe Harbor exemptions
- ✓ Meet the 60%-40% ownership & revenue tests
- ✓ Identify permissible self-referral arrangements
- ✓ Restructure existing joint ventures to comply with the regs
- ✓ Write space, equipment rental and personal service contracts that pass strict legal tests
- ✓ Accept supplier discounts legally
- ✓ Evaluate new investment opportunities for possible Medicare kickback challenges
- ✓ Assess fair-market value accurately
- ✓ And much, much more

## Get practical approaches to put together safe, profitable joint ventures from these pros

Craig Holden, a partner with the Baltimore office of Ober, Kaler, Grimes & Shriver, represents providers in all areas of the health care industry. From 1983 through 1987, he was a trial attorney with the Inspector General Division, Office of the General Counsel, Department of Health and Human Services.

Sanford Teplitzky, also with Ober, Kaler, Grimes & Shriver, has more than 14 years' experience in health law. While with the Dept. of Health, Education and Welfare, Mr. Teplitzky developed policies to implement anti-fraud legislation. He is the author of "Avoiding Fraud and Abuse Problems in Joint Ventures" (*Health Span*).

## The Anti-kickback Statute & the Safe Harbors

There are 11 Safe Harbors -- how many must you meet? Find out. This plain-English explanation of how the Safe Harbors were developed will put anti-kickback enforcement into perspective for you.

## New investment interest and revenue tests

Get a clearer understanding of these most important -- and most confusing -- Safe Harbors. Find out which of your investors the government says are in a position to "make or influence" referrals. Take home ways to structure limited partner buyouts to meet the 40% ownership test. Then, find out how to calculate revenue percentages to monitor compliance with the 40% revenue requirement.

## The Impact of Maryland Senate bill 169

Steve Buckingham, Med Chi's general counsel, clarifies how new state regulations on patient referrals affect your business dealings. Find out how to comply with ownership disclosure rules, and what new challenges lie ahead.

## Fair market value, group practice sales & more

Discover how the Safe Harbors define fair market value for equipment and space leases, how to assess the value of intangibles like practice goodwill and ensure all your financial arrangements fall within the borders of the new rules. You'll get expert strategies and "bright-line" tests to assess current contracts and ensure opportunities are safe.

## Question & answer period

During the final hour of the seminar, Mr. Holden and Mr. Teplitzky answered questions about the Safe Harbors and their impact on specific types of health care business ventures. Benefit from their revealing answers and down-to-earth advice.

## SAFE HARBORS AUDIO-CASSETTE TAPES REQUEST FORM

**Brief Summary. Consult the package insert for complete prescribing information.**  
**Indications and Usage:** 1. *Active duodenal ulcer*—for up to 8 weeks of treatment. Most patients heal within 4 weeks.

2. *Maintenance therapy*—for healed duodenal ulcer patients at a reduced dosage of 150 mg h.s. The consequences of therapy with Axid for longer than 1 year are not known.

**Contraindications:** Known hypersensitivity to the drug. Because cross sensitivity in this class of compounds has been observed, H<sub>2</sub>-receptor antagonists, including Axid, should not be administered to patients with a history of hypersensitivity to other H<sub>2</sub>-receptor antagonists.

**Precautions:** *General*—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.

3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

**Laboratory Tests**—False-positive tests for urobilinogen with Multistix<sup>®</sup> may occur during therapy.

**Drug Interactions**—No interactions have been observed with theophylline, chlordiazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

**Carcinogenesis, Mutagenesis, Impairment of Fertility**—A 2-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 60 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a 2-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a 2-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

**Pregnancy—Teratogenic Effects—Pregnancy Category C**—Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in 1 fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in 1 fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

**Nursing Mothers**—Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

**Pediatric Use**—Safety and effectiveness in children have not been established.

**Use in Elderly Patients**—Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

**Adverse Reactions:** Clinical trials of varying durations included almost 5,000 patients. Among the more common adverse events in domestic placebo-controlled trials of over 1,800 nizatidine patients and over 1,300 on placebo, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common with nizatidine. It was not possible to determine whether a variety of less common events were due to the drug.

**Hepatic**—Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to 3 times the upper limit of normal, however, did not significantly differ from that in placebo patients. All abnormalities were reversible after discontinuation of Axid. Since market introduction, hepatitis and jaundice have been reported. Rare cases of cholestatic or mixed hepatocellular and cholestatic injury with jaundice have been reported with reversal of the abnormalities after discontinuation of Axid.

**Cardiovascular**—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in 2 individuals administered Axid and in 3 untreated subjects.

**CNS**—Rare cases of reversible mental confusion have been reported.

**Endocrine**—Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to nizatidine. Impotence and decreased libido were reported with equal frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

**Hematologic**—Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H<sub>2</sub>-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

**Integumentary**—Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

**Hypersensitivity**—As with other H<sub>2</sub>-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

**Other**—Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

**Overdosage:** Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis does not substantially increase clearance of nizatidine due to its large volume of distribution.

# Succeed In The 90's With

## Computerized Medical Records

Did you know that most doctors spend about 40% of their time recording and trying to decipher patient histories from traditional Medical Charts?

Smart Chart's unique software package affords quick and easy access to medical records.

By using Smart Chart, you will have more time to...

- See patients
- Conduct research
- Enjoy yourself!

Call Smart Chart, Inc. today and see how easy it is to *Succeed in the 90's with Smart Chart!*

# Donald E. Wilson MD

## Dean of the University of Maryland School of Medicine:

### An Interview with MMJ's Editor

---

**Betsy Newman**

---

*Ms. Newman is Director of Public Relations, Medical and Chirurgical Faculty of Maryland, Baltimore, MD.*

**T**o hear the innovative ideas Dean Donald E. Wilson MD has planned for the University of Maryland School of Medicine, you have to make an appointment with the pocket-size computer that is his constant companion. The computer not only illustrates Dr. Wilson's busy schedule, but also symbolizes the progressive thinking he hopes will lead the medical school into the next century.

"This is a very exciting place to be. There's no question about it," says Dr. Wilson during a recent interview with *Maryland Medical Journal* (MMJ) editor, Victor H. Hrehorovich MD. "I'm interested in looking at what needs to be done for the 21st century and I'm willing to take some risks to make the University of Maryland better."

#### Goals for the Year 2000

Dr. Wilson, who became dean of the medical school in September 1991, accepted the position because it offers many challenges: "I saw the medical school as a forward-moving, well-respected urban university interested in developing an excellent staff for education and research. At the same time, the medical school was also very responsive to the community."

Education, research and community programs are at the top of Dr. Wilson's pocket computer agenda. In the coming months, he plans to consult with other school officials to develop a vision for the medical school — a plan for the year 2000. This plan will encompass creative changes in curriculum, research, and community interaction. Although the plan is not expected to be complete until next summer, Dr. Wilson is optimistic that the university will favor his ideas.

#### Revising the Curriculum

"I want to take a fresh look at the curriculum," says Dr. Wilson, who believes the medical school should change its approach to education. In the new curriculum, students would focus on practical problem-solving rather than on tests and lectures. "I want to see if we can make doctors rather than people who memorize things," he explains. "Students need to be taught how to *think*. Resources will always be available to obtain factual information."

---

*Dr. Wilson is interested in working with Med Chi to develop relevant continuing medical education (CME) programs for physicians in Baltimore and throughout the state.*

---

"One thing I hear a lot of from medical students is that they hate medical school for the first two years," he remarks. "They hate medical school because they don't see the **relevance** of what they're doing. While they're memorizing facts, listening to lectures, and taking exams, they wonder what this has to do with being a physician." Dr. Wilson's multidisciplinary approach would have medical students interact with patients during their first two years, to make it more analogous to actual medical practice.

"I also think the curriculum should be more responsive to community needs," says Dr. Wilson. It makes little sense for me to produce people who can tell me about molecular biology and cloning but can't tell me anything about nutrition or preventive medicine." Dr. Wilson also believes that, "we have to very quickly and dramatically increase the amount and quality of computer technology here in order to facilitate progress and patient care."

### Research

In addition to education and clinical care, Dr. Wilson maintains that research is an equally important component of the medical school and is essential to medical advances. In fact, he has transferred his own medical lab from New York to Maryland. However, he also wants to be sure that researchers don't lose sight of what they are doing research for — to improve health care.

While serving as chairman of the Department of Medicine at the State University of New York (SUNY) Health Science Center at Brooklyn, he insisted that researchers spend at least one month a year seeing patients and teaching on the wards so that they would not lose sight of the relevance of their work to patient care. Even at Maryland, Dr. Wilson plans to keep on seeing patients himself.

In fiscal year 91, the University of Maryland School of Medicine had the highest increase in research funding of any state university. Despite this increase, the University of Maryland as a whole is in a budget crisis. Having lost nearly 12 percent of its state-supported budget over the past two years, the School of Medicine anticipates additional state budget cutbacks in the coming year. State budgetary support is vital for the school's operating costs and for continuing expansion. "I knew that Maryland had some difficulties financially, but not to this extent," comments Dr. Wilson.

### Wanted: Space

He explains that the school is in need of a new health science facility which is unattainable within the current budget. Without another 80,000 square feet of space, Dr. Wilson projects that it will be difficult for the school to conduct classes in small groups or recruit additional investigators with research grants.

**Figure 1.** Med Chi President J. David Nagel MD (l) presents Dr. Wilson with a copy of Med Chi's Bylaws. As dean of the University of Maryland School of Medicine, Dr. Wilson is a member of Med Chi's Council.

This lack of space also affects the quality of research and the financial status of the medical school. For example, he describes, "A researcher at another institution who likes the atmosphere of the University of Maryland, may have six or seven million dollars in grants that he's willing to bring to Baltimore. This researcher may have fourteen people working for him and need 4,000 square feet of space. We can't compete for that researcher and his grants because we don't have the space. Up to this point, research growth has been phenomenal, but we can't continue to grow without space."

In addition, there are about 95 faculty members who currently do not have offices at the University. "As renovations occur, we are playing dominos with the staff," says Dr. Wilson. Unless a new structure is built, Dr. Wilson does not foresee an increase in laboratory facilities or teaching faculty.

Dr. Wilson explains he is currently evaluating a computer study conducted over the past three years that depicts the medical school's use of space based on the number of staff, amount of grant money, and other factors. In a few months, he intends to reallocate some of the school's space to insure it is being used efficaciously.

### Community Interaction

Once adequate research and teaching space are obtained, Dr. Wilson wants the medical school to initiate more studies that incorporate community needs. For example, a study relevant to Baltimore City would examine the problems of high infant mortality and low birth weight. Such research might not only reveal factors that cause low birth weight and high mortality but might show ways to prevent these problems. "It's much easier to prevent disease than it is to treat," asserts Dr. Wilson adding, "The medical school needs

**Figure 2.** Donald E. Wilson MD hopes to implement many innovative ideas during his tenure as dean of the University of Maryland School of Medicine.

to play a major role in community-based research as well as concentrating on molecular biology."

To meet other community needs, Dr. Wilson hopes to encourage more student interaction through outreach programs such as sending students to health fairs. His plans for revising the curriculum will play an important role in getting students out of the classroom and into the community. He believes this will be educational for students, will be helpful for people in the community, and will demonstrate the school's vested interest in Baltimore's future.

### **The Importance of Minority Students**

"In the 21st century, the majority of the people in the United States will be members of minorities," he explains. "If you don't prepare these individuals to do all of the science and health care and everything else that needs to be done, this country will be unable to compete. I think it is in our best interest to ensure that there will be a large number of well-educated, well-trained, well-prepared individuals to do all the things that this country is going to need in the year 2000. I want to help."

Dr. Wilson is very dismayed about the low percentage of underrepresented minorities currently serving on medical school faculties. Among our nation's medical schools, only about 3 percent of the faculty are members of underrepresented minorities. The majority of these faculty members — about 40 percent of that three percent total — are at Howard, Meharry, Moorehouse, and Drew. At the other 123 medical schools in the United States, only about 1.75 percent of the faculty consists of underrepresented minority members.

Attempting to change these figures, Dr. Wilson helped initiate the Association for Academic Minority Physicians, an organization dedicated to making people understand that this country needs to increase minority participation in academic medicine. Other founding members of this association included U.S. Health and Human Services Secretary Louis W. Sullivan MD; the late John W. Townsend MD, then chairperson of the Department of Medicine at Howard; Bruce Trotman MD, former chairperson of the Department of Medicine at Meharry; Carroll M. Leey MD, chairperson of the Department of Medicine at the New Jersey Medical School; and Gerald Thomson MD, associate dean of the College of Physicians and Surgeons at Columbia University.

To increase the number of minorities in academia, Dr. Wilson maintains that outreach efforts should begin with students in college and high school. At the University of Maryland Medical School, over 13 percent of the current freshman class consists of underrepresented minority individuals — a higher figure than at most other medical schools in the country.

In addition to difficulties encountered enter-

**Figure 3.** Dr. Wilson's wife, Patricia, stands with her husband and U.S. Health and Human Services Secretary Louis W. Sullivan MD. Dr. Wilson and Dr. Sullivan helped establish the Association for Academic Minority Physicians.

ing the academic system, Dr. Wilson admits that minority students generally face financial problems. According to Dr. Wilson, 85 percent of all medical students have some debt upon graduation. The amount of debt is usually higher for minority students than non-minority students. One potential explanation is that many minority students have other responsibilities that are not faced as commonly by non-minority students, such as having to provide for their family. "I don't mean their wife and children, I mean their families," he explains. "We do have financial aid programs and I am going to do my best to make sure they survive the cuts. I will do my best to help get all of our students through the system," asserts Dr. Wilson.

Overall, student applications at the medical school are up about 30 percent. The medical school now admits 150 students, chosen from a field of 4,000 applicants. Of the students who graduate, less than half enter primary care specialties such as internal medicine, pediatrics, family medicine, or obstetrics and gynecology.

To encourage more students to enter primary care, Dr. Wilson suggests changes be made in the curriculum to make primary care more attractive to students. He notes that under the usual curriculum, students spend twelve weeks seeing critically ill people, many of whom have numerous complications. Although this isn't the norm in primary care practice, students have nothing else with which to compare it. As a result, many students do not view primary care as an attractive specialty. Dr. Wilson suggests changes in the way students rotate through the specialties so that they will have a more realistic understanding of primary care. He notes, however, that just changing the curriculum won't increase the number of primary care physicians; many medical students choose specialties other than primary care for economic reasons.

Dr. Wilson recalls that he selected gastroenterology as his specialty "because I was thoroughly impressed by an attending physician who happened to be a gastroenterologist. I knew nothing about gastroenterology and was so impressed by this doctor that I wanted to do what he was doing." He adds, "I'm probably one of the few people around who used the early rigid endoscopes on people."

**Background**

A graduate of Harvard University, Dr. Wilson earned his medical degree from Tufts in 1962. He served his internship and residency at the Veteran's Administration Hospital in Boston, where he was named senior medical resident for the Gastroenterology Service in 1964. A year later he became chief resident and research fellow in gastroenterology at the Lemuel Shattuck Hospital in Boston. After two years in the U.S. Air Force in Omaha, Nebraska, he practiced and taught in Brooklyn from 1968-1971, when he moved to the University of Illinois in Chicago.

In 1973, Dr. Wilson became chief of the Gastroenterology Sections of the Abraham Lincoln School of Medicine at the University of Illinois and the University of Illinois Affiliated

**Figure 4.** The Wilson family during a trip to Asia: (l to r) Sheila, Sean, Monique, Donald, and Patricia.

Hospitals in Chicago. During his tenure as chief, he was director of graduate education for the Department of Medicine of the Abraham Lincoln School of Medicine from 1975 to 1977 and was physician-in-chief of the University of Illinois Hospital in 1976. In 1975, he was promoted to professor of medicine on the faculty at the Abraham Lincoln School of Medicine and, from 1976 to 1977, was acting chairman of the Department of Medicine. In 1977 and 1978, Dr. Wilson spent a year as an honorary consultant and visiting professor of Medicine at King's College Hospital in London, England.

Before accepting the position as dean of the University of Maryland School of Medicine, Dr. Wilson was physician-in-chief at the University Hospital of Brooklyn, State University of New York Health Science Center at Brooklyn, and Kings County Hospital Center in Brooklyn from 1980 to 1991. While in New York, Dr. Wilson also served as regional chairman for the Department of Medicine in the Kings County Hospital, Woodhull Hospital, and State University Hospital from 1983 to 1988.

Dr. Wilson is a fellow of the American College of Nutrition and of the American College of Physicians. He is a member of numerous renowned medical societies, including

the Association of American Physicians and the Association of Professors of Medicine

He is also a founding member of the Digestive Diseases Foundation and of the Association for Academic Minority Physicians.

Since 1975, he has served as editor of *Prostaglandins*, a section of *Medicine and Clinical Therapeutics*. He has been consulting editor for the *Journal of the American College of Nutrition* since 1982 and associate editor for the *Journal of the Association for Academic Minority Physicians* since 1989.

Among his numerous special appointments, Dr. Wilson recently completed work with the National Institutes of Health (NIH) General Clinical Research Centers Committee. He was also appointed chairman of the NIH National Digestive Diseases Advisory Board and was chairman of the Food and Drug Administration's Gastrointestinal Drugs Advisory Committee.

During the week, Dr. Wilson resides near the medical school in Baltimore. On weekends, he commutes to Scarsdale, New York to be with his family. His wife, Patricia C. Littell; daughter Sheila, 23, an aspiring pediatric psychologist; son Sean, 12; and daughter Monique, 9, will move to Maryland to join him in June 1992. Dr. Wilson's eldest son, Jeffrey, 29, is an engineer living in Chicago.

### The Year 2000

Dr. Wilson looks forward to the challenge of being dean of the University of Maryland School of Medicine. He concedes, "I didn't realize that it would be quite the challenge that it is." When Med Chi President J. David Nagel recently welcomed Dr. Wilson to Maryland, Dr. Nagel asked what Med Chi could do to facilitate the essential changes that Dr. Wilson envisions. Dr. Wilson responded that he could conceive of several scenarios in which the medical school could work directly with the organized medicine community to promote advances in health care and medical education.

Dr. Wilson added that the school would be applying for federal research grants to develop practice protocols for the management of commonly occurring diseases in the community. Once developed, there will be opportunities for the medical school to communicate this information to the physician community through medical societies and publications like the *MMJ*. Similarly, Dr. Wilson is interested in working with Med Chi to develop relevant continuing medical education (CME) programs for physicians in Baltimore and throughout the state. This may be a bidirectional effort in that Med Chi could help identify topics and methods of

Figure 5. Sheila Wilson (l), an aspiring pediatric psychologist, poses with her father.

Figure 6. Dr. Wilson's twelve-year-old son Sean (c), his wife Patricia (r), and their nine-year-old daughter Monique (not pictured) plan to move to Maryland to join Dr. Wilson (l) in June 1992.

presentation that would be most relevant to physicians, patients, and the community.

Dean Wilson's plans to revise the curriculum, expand facilities, augment research, and improve community relations are just a few examples of his vision for the medical school in the year 2000. Due to current financial difficulties, it is difficult to estimate how many of these changes will be implemented. One thing, however, is certain: Dr. Wilson displays the innovation, drive, and determination to successfully lead the University of Maryland School of Medicine for many years to come. ■

# The Use of a Low-level Stage During Exercise Testing in Predicting Severe Coronary Disease

---

Romulo F. Baltazar MD, Albert Grant MD,  
Vicki O'Mara RN and Mark B. Effron MD

---

*From the Division of Cardiology, Department of Medicine, Sinai Hospital of Baltimore, where Dr. Baltazar is Director, Non-invasive Cardiology, Dr. Grant is the former Director of the Cardiac Rehabilitation Program, Ms. O'Mara is a nurse, and Dr. Effron is Director of the Coronary Care Unit*

---

*In a study of eighty-one patients with a positive stress test who underwent coronary angiography, the results showed that a positive test at warm-up or Stage I of the Bruce protocol is usually a sign of severe coronary disease, although patients with less severe disease may also be included.*

---

**P**atients with severe coronary artery disease (CAD) manifest positive ischemic responses early during exercise testing—usually during the first two stages of the Bruce protocol.<sup>1,2</sup> Although an early positive test is often a sign of severe CAD, patients with less severe disease may also be included. Therefore, the sensitivity and the predictive value of this early ischemic response in identifying left-main coronary disease (LMCD) and three-vessel disease (3VD) remain poor and have not been clinically useful.<sup>2</sup> We have noted that some patients undergoing routine diagnostic exercise testing often develop very early positive ischemic responses if the exercise test is modified to include a stage lower than Stage I of the Bruce protocol. It is possible that with the addition of a lower level stage, ischemic changes could be detected earlier and be more predictive of LMCD and 3VD than if first manifested at a higher level of exercise.

## Methods

To test this hypothesis, eighty-one patients with positive stress tests, who underwent coronary angiography within three months of exercise testing, were reviewed. There were sixty-six males and fifteen females, ranging in age from thirty-five to eighty-four (mean age, fifty-eight years). The patients were referred for exercise tests because of symptoms suspicious for CAD. Patients with intraventricular conduction defects in baseline electrocardiogram (EKG), or on anti-anginal medications on the day of the test, were excluded. Each patient was exercised on a motorized treadmill starting at a stage lower than Stage I of the Bruce protocol (warm-up stage). The test consisted of a workload of two mph, 2.5 percent grade (approximately three METS (multiples of resting oxygen consumption)) for two minutes. The patient rested for three minutes and was then tested using the standard Bruce protocol.<sup>3</sup>

The twelve-lead EKG was recorded on a three-channel recorder at baseline, during and after warm-up, every minute during exercise, at peak exercise, immediately after exercise, and every minute for the next six to

ten minutes after exercise. An oscilloscope displayed each patient's rhythm at all times. Exercise testing was terminated usually because of symptoms such as chest pain, shortness of breath or fatigue, as well as for grossly evident ischemic changes (2 mm or more of ST segment depression) on the exercise EKG.

An exercise test was considered positive if 1 mm or more of horizontal or downsloped ST segment depression was present in at least three consecutive beats in any of the twelve leads during or after exercise testing. The heart rate at the earliest ischemic manifestation was obtained from the recorded EKG, and the maximal predicted heart rate for each patient was adjusted according to age.<sup>4</sup>

All patients had coronary angiograms within three months of the exercise test. LMCD was defined as 50 percent or greater narrowing of the luminal diameter of the left main coronary artery, and significant CAD was defined as 70 percent or greater narrowing of any of the three coronary arteries or their major branches. An exercise test result was considered a true positive test when the EKG abnormalities during exercise testing were associated with significant CAD during angiography. The exercise test result was considered a false positive when the EKG abnormalities were not associated with significant narrowing of any coronary artery.

Results

The Table shows the distribution of CAD among eighty-one patients with positive stress tests. There were more patients with warm-up or Stage I positive tests compared to other stages, reflecting the higher number of patients with positive stress tests who were eventually referred for coronary angiography by their physicians. Thirty-six of eighty-one patients were warm-up positive. Seventy-five percent (27/36) of these warm-up positive patients had multivessel disease, with more than half (61 percent) having LMCD or 3VD. Twelve warm-up positive patients had LMCD (sensitivity, 75 percent; predictive value, 33 percent) and ten patients had 3VD (sensitivity, 38 percent; predictive value, 28 percent). The sensitivity and the predictive value of a warm-up positive test for LMCD or 3VD are 52 percent and 61 percent, respectively.

Thirteen patients could not exercise beyond the warm-up period because of symptoms and/or marked ST segment depression during exercise. A total of fifty-one patients were

positive at Stage I (twenty-three at warm-up, twenty-eight at Stage I). Eighty-two percent (42/51) of Stage I positive patients had multivessel disease. The sensitivity and the predictive value of a Stage I positive test are 100 percent and 20 percent, respectively, for LMCD, 78 percent and 35 percent for 3VD, and 85 percent and 55 percent for LMCD or 3VD.

Four of eighty-one patients (5 percent) with positive exercise tests had no significant CAD during angiography. Two of the four false positive responses occurred during warm-up.

The average heart rate corrected for age is 63 percent for warm-up positive patients and 67 percent for Stage I positive patients. Most of the patients (21/36) who were warm-up positive had heart rate responses  $\leq$  70 percent of the predicted maximum; approximately 86 percent (18/21) of these patients had LMCD or 3VD. For Stage I positive patients, twenty-six of fifty-one had heart rate responses  $\leq$  70 percent of the predicted maximum; approximately 58 percent (15/26) of these patients had LMCD or 3VD.

Discussion

The prognosis and quality of life of patients with LMCD and 3VD have been significantly improved with surgery.<sup>5</sup> Exercise testing offers a noninvasive alternative for identifying this group of patients, so they can be managed appropriately. However, the sensitivity and predictive value obtained from traditionally used parameters for identifying patients with LMCD and 3VD during exercise testing have been generally poor and are not helpful for the individual patient. Our study attempts to better identify this group of patients during routine diagnostic exercise testing by the addition of a stage lower than Stage I. The results show that a positive test very early during exercise at warm-up or Stage I levels usually indicates the presence of multivessel disease. There were, however, a number of patients with single vessel disease and a few with no significant CAD who also became positive at this lower-level stage (total, 25 percent), suggesting that an early positive test is not necessarily indicative of severe CAD.

The sensitivity of a warm-up positive test for LMCD or 3VD is 52 percent, compared to 85 percent for Stage I positive patients. The predictive value of a positive test for LMCD or 3VD is 61 percent for warm-up and 55 percent for Stage I. This suggests that a positive test at the three MET level does not identify the presence of LMCD or 3VD any better than a positive test at Stage I (four to five METS). There was, however, a tendency for patients who were positive at warm-up to have LMCD or 3VD if the heart rate was  $\leq$  70 percent of the maximum predicted, although this was not statistically significant ( $p=0.077$ ).

Therefore, the addition of a lower-level stage during routine diagnostic stress testing is not helpful in predicting the presence of LMCD or 3VD. Although one would expect that a positive test at a lower level of exercise would predict severe CAD better than a positive test at a slightly higher workload, a lack of correlation exists partly because coronary anatomy does not always reflect coronary flow and, therefore, the

Table. Distribution of Coronary Disease

Positive Stage	N	LMCD	3VD	2VD	1VD	NL
Warm-up	36	12	10	5	7	2
Stage I	28	4	11	10	3	0

# Insignificant Blunt Maternal Trauma with Lethal Fetal Outcome: A Case Report

---

Islam H. Sidky MD, Norman H. Daikoku MD and Jay Gopal MD

---

*Dr. Sidky is an obstetrician/gynecologist in private practice in Greenville, SC. Dr. Daikoku is Director of Obstetrics and Dr. Gopal is a neonatologist/pediatrician at Union Memorial Hospital, Baltimore, MD.*

---

*We report a case of a twenty-nine-week breech fetus with skull fracture, intracranial bleeding, and liver laceration sustained in a vehicular accident. This case describes insignificant maternal trauma with poor fetal outcome.*

---

**M**otor vehicle accidents can inflict severe trauma on the mother and her fetus. Crosby reported maternal death as the leading cause of fetal death subsequent to vehicular accident.<sup>1</sup> In addition, the greater the severity of maternal injury, the greater the likelihood of fetal demise.<sup>1,2</sup> However, even minor maternal injuries can result in fetal death.<sup>3,4</sup> Cummings reported a case of fetal skull fracture following a vehicular accident that caused only minor trauma to the mother, with no abdominal bruising or tenderness.<sup>5</sup>

All reports of fetal skull fracture reviewed in the literature occurred in the vertex presentation when the engaged fetal head is vulnerable to injury from fracture of the maternal pelvis.<sup>2,5</sup> Crosby describes an experimental study of head injury in breech baboon fetuses which do not include skull fractures.<sup>6</sup>

## Case Report

An eighteen-year-old woman (gravida 1, para 0) at twenty-nine weeks gestation was admitted for evaluation following a motor vehicle accident. The patient-driver was wearing a three-point restraint belt when she impacted with a pole at approximately thirty miles per hour. The patient sustained an upper lip laceration requiring several sutures. There was no loss of consciousness, abdominal bruising, or tenderness. An x-ray examination of the head, chest, abdomen, and pelvis were normal. A limited intravenous-pyelogram (IVP) was normal (Figure 1). Vital signs, hematocrit, and fetal heart were normal. An external fetal monitor tracing showed no deceleration; an irritable uterine pattern was resolved with intravenous hydration.

A sonogram confirmed a twenty-nine-week breech fetus with normal amniotic fluid and no sign of abruption. Acute onset of fetal bradycardia was identified ten hours following the initial examination when the patient complained of abdominal pain while under continuous monitoring and observation. A cesarean section was performed and a greater than 25 percent placental abruption was noted. A 1,300 gm male infant was

delivered with Apgar scores of 0 at one minute, 0 at five minutes, and 3 at ten minutes. Kleihauer-Betke analysis showed no fetomaternal transfusion. The mother's serum was positive for cannablenoids.

The infant was intubated and stabilized. Pupils were dilated and fixed, with no spontaneous activity or breathing. A head sonogram revealed extensive Grade IV intraventricular hemorrhage. This was complicated by thrombocytopenia, hypovolemia, renal failure, multiple transfusions, and recurrent seizures. In spite of full respiratory support and a constantly increasing  $\text{FiO}_2$  (fractional inspired oxygen), the oxygen saturation level decreased. Twelve days following delivery, the infant expired. Autopsy revealed a left parietal skull fracture with intracranial bleeding and liver laceration with subcapsular hematoma.

### Discussion

Excluding maternal death, abruptio placenta is the most common cause of fetal death following major or minor trauma during pregnancy.<sup>1,2</sup> Minor injuries account for 1 to 5 percent of fetal death, and major injuries account for 20 to 50 percent of fetal loss.<sup>1,2,7</sup> We report a case of abruption of the placenta ten hours post-trauma. This may emphasize the need for prolonged fetal monitoring and extended patient observation in such cases.<sup>8,9</sup>

The majority of fetal skull injuries are attributable to maternal pelvic fracture in which the dislocation of the pelvic bone crushes the entrapped fetal skull.<sup>1,6</sup> Cummings and Warren reported skull fracture in the vertex presentation following minor maternal injury without pelvic fracture.<sup>5</sup> To our knowledge, ours is the first report of fetal skull fracture in the breech presentation secondary to blunt maternal trauma.

The maternal patient presented with no apparent external abdominal bruising or injuries, as well as no internal injuries during an exploration of the abdomen and pelvis at the time of cesarean section. The severity of the accident was reflected in the extensive damage to the vehicle; this information was obtained from the police report. A review of the patient's x-ray was negative for fetal skull fracture, perhaps because of overlapping with the maternal spine (Figure 2). The patient's injuries were considered as insignificant trauma according to previously published classifications.<sup>2,10</sup>

Hoff et al noted in a recent report that maternal abdominal and facial injuries are indicators of the mechanical force of an accident and may predict poor fetal outcome.<sup>11</sup> However, using the Injury Scoring System (ISS) was not of value for our patient.<sup>12</sup> We conclude that physicians cannot depend only on the severity of trauma to the mother alone as a prediction of outcome for the fetus. Knowing the severity of

Figure 1. A limited intravenous pyelogram was normal.

Figure 2. The patient's x-ray was negative for fetal skull fracture, perhaps because of overlapping with the maternal spine.

the accident, including the speed and extent of vehicular damage, may alert physicians to consider a prolonged observation of those patients who have sustained insignificant injuries.

# THE TEST OF PROFESSIONAL LIABILITY COVERAGE ISN'T WHEN YOU BUY IT.

Now Maryland physicians can get coverage from the carrier that offers a

**IT'S WHEN  
YOU USE IT.**

stronger support system at the critical time of need than any other company serving the region.

The carrier is the successful physician-owned National Capital Reciprocal Insurance Company: NCRIC.

The leading professional liability carrier in D.C. now comes to Maryland offering unique approaches to service and protection, all at Maryland rates.

For example, you'll be assigned your own NCRIC claims representative who serves substantially fewer clients

than reps with other carriers. So, in claims and underwriting, you'll get faster, more personal attention to any question or problem, minor or major.

NCRIC also offers especially attractive coverages for physicians just starting a practice, those practicing in two or more jurisdictions (D.C., MD, VA), part-time practitioners, and physicians who take maternity leave.

Learn more about the ways NCRIC demonstrates a sensitivity to the needs of the medical community in ways no other carrier does. Call (301) 424-8136.

# Dr. Nathaniel Potter's Contributions to Medicine and the University of Maryland

---

William Samuel Potter II

---

*Mr. Potter is the great great grandnephew of Dr. Nathaniel Potter and the family historian.*

---

*One of the founders of the University of Maryland, Dr. Nathaniel Potter was the school's first Professor of Theory and Practice of Medicine*

---

**D**r. Nathaniel Potter (Figure 1), of Newport, Rhode Island ancestry, was the son of Dr. Zabdiel Potter, a surgeon in the Continental Army during the Revolutionary War. He was born in 1770 in Easton, Talbot County, Maryland and was raised at Potter's Landing (Figure 2) in Caroline County, Maryland. He was first married on June 3, 1798 to Catherine Goldsborough, daughter of Thomas Goldsborough and Catherine Fauntleroy of Virginia who was a niece of General George Washington. However, they were only married about eight years before Catherine died at a relatively young age. His second wife was Henrietta M. Ford, whom he married on May 20, 1809. They had two daughters, Henrietta and Mary, who never married.

Nathaniel Potter graduated from college in New Jersey and was attending medical school at the University of Pennsylvania when his father died in April 1793. At that time, he briefly returned to Potter's Landing, Caroline County. During the Philadelphia yellow fever epidemic in August of that same year, he again returned to Maryland for an extended period to settle his father's estate and assume responsibility for the care of his father's practice in Caroline County. During his year of practice in Caroline County, he learned a great deal, particularly about yellow fever. His theory that yellow fever was not contagious between people helped to make him famous. Once the yellow fever epidemic was over, he returned to Philadelphia to complete the requirements for his medical degree; he graduated in 1796.

In 1797, Dr. Potter began to practice in Baltimore where he continued to do extensive work on yellow fever. He rejected the views of his former tutor, Dr. Benjamin Rush, that yellow fever was contagious. (It was said that Nathaniel Potter was the favorite pupil of Dr. Rush, one of the great men of America during the late 1700s and early 1800s, and a signer of the Declaration of Independence.) To prove his convictions, Dr. Potter went to the extreme of soaking towels in the "perspirable matter" of a patient with yellow fever whom he was attending on September 29, 1797. After binding the towels to his head and retiring, he reported that in spite of "extreme nauseous fotor" he experienced only transient sickness and slept

Figure 1. Nathaniel Potter MD

until 7 a.m. the next morning. He showed no later signs of incapacitation. In mid 1798, Dr. Potter inoculated himself with "perspirable matter" from a patient in the last stages of yellow fever. On October 11, 1798, he took suppurative matter from inguinal buboes of other malignant cases and inoculated himself. Dr. Potter experienced only local redness at the sites of the inoculations. His courageous self-studies really proved nothing for several reasons: It was possible that he was immune because of a prior attack of yellow fever, or his test patients may not have suffered from the disease or may have eliminated the virus from their tissue. Dr. John Beale Davidge, the first to agree with Dr. Potter on the subject of yellow fever, had his views published in the *Federal Gazette of Baltimore* in 1797. The question of yellow fever contagion would go unresolved for almost a century until Drs. Henry Carter and James Carroll played major roles in settling the question and established its transmission by mosquitoes.<sup>1</sup>

Dr. Potter played a major role in the founding and maintaining of the University of Maryland Medical School. In the fall of 1807, Dr. Pot-

ter, Dr. Davidge, and associates began to lecture together. This was the beginning of the College of Medicine of Maryland. They successfully applied to the Maryland Legislature for legal protection and a charter for the school. The school was formed and officially named "The College of Medicine of Maryland." It was placed under the control of the college's professors and the newly created Board of Medical Examiners.<sup>2</sup> This was the beginning of the Board of Regents' reign. (At this time, only four other medical schools existed in the country: Harvard University, Dartmouth College, University of Pennsylvania, and the College of Physicians and Surgeons of New York.)

In 1812, the college began to look for funds to build suitable quarters. Individual members of the Board of Regents, including Dr. Potter, borrowed funds from local banks. They also petitioned the Legislature for the right to conduct a lottery to raise additional funds. (At that time, lotteries were very popular in helping to raise funds for Baltimore's old buildings.) However, the majority of the funds that were obtained came from the Board members' personal notes. Colonel John Eager Howard sold them the lot on the corner of Greene and Lombard Streets for a nominal fee. This is the location of Davidge Hall.

In 1812, the Board of Regents petitioned the Legislature to obtain a charter for a university, with the medical college as the nucleus. This request was granted, and in 1812 the University of Maryland was established.<sup>3</sup> The charter of the University called for Schools of Divinity, Arts and Sciences, Law, and Medicine. Each of these schools was to be governed by its own faculty and, collectively, these faculties would comprise a general Board of Regents that would govern the whole University. The School of Medicine was the strongest at that time and is the only school which has endured an uninterrupted existence. For about fifteen years after its beginning, the University of

Figure 2. Potter's Landing in Caroline County, childhood home of Nathaniel Potter MD

Maryland Medical School struggled under a heavy burden of debt, working and fighting for permanence. Remember that the University was originated by a private group of men. Its buildings were erected by them largely out of their own purses, and most of them were still accountable for notes for large sums of money used for running the University.

In 1826, the Legislature proceeded to pass an Act that, in essence, took away control of the University from the Board of Regents and placed it instead in the hands of a group of Trustees appointed by politicians. Adding insult to injury, the decree made no provision for reimbursement to the members of the Board of Regents for money they had spent, and expressly announced that the faculty was not to be relieved from paying the interest on a large loan which still stood against the University.<sup>2</sup>

The faculty did not sit idly by under the State's ruling, but protested vigorously this invasion of rights. However, there was little that the Board of Regents could do. Because they were so in debt, they could not afford to pay legal fees for a battle against the Legislature. They consulted constitutional authorities, such as the U.S. Attorney General and Statesman Daniel Webster, who informed them that the action of the Maryland Legislature was clearly illegal. This act, passed by the Maryland Legislature, violated Article I, Section 10, of the U.S. Constitution that forbids any state from passing a law impairing the obligation of contracts. Dr. Potter was never reconciled to the Legislature's decision and vowed to continue to fight. To the very near end of his life, he never let an opportunity go by to take a crack at the Trustees he so ardently disliked.<sup>2</sup>

The Board of Regents reorganized, with Drs. Davidge, Potter, DeButts, Hall, McDowell, and Baker as members. A costly legal battle ensued for many years until 1839 when the Maryland Court of Appeals reversed the decision of the lower court. This high court's decision dissolved the Board of Trustees, forcing them to withdraw their illegal charter and revert control to the original founders, the Board of Regents.<sup>4</sup> However, this legal victory cost Dr. Potter his entire fortune. He was forced to move out of his residence on Lexington St. and take up residence in a much smaller house on St. Paul St. After spending most of his wealth on the founding and maintaining of the medical school, and on the lengthy legal battle with the State of Maryland, he lived in poverty until his death. Yet Dr. Potter was one of two or three individuals who started the school and who stayed with it until it became one of the most prosperous and celebrated medical schools in the country.<sup>3</sup> Every other man whose name appears in those early annals either died, quit under fire, or eventually wavered in his loyalty to the medical school. Dr. Potter seems never to have hesitated an instant in his unswerving devotion to its cause; it seems nothing shook him. The University owes its present existence mainly to Drs. Potter and Davidge, as well as the other members of the Board of Regents.

Dr. Potter was not only a founder of the University of Maryland Medical School, but also held the Chair of Theory

and Practice of Medicine from 1807 until his death on January 2, 1843. Dr. Potter spent two hours a week leading students through the infirmary to match lecture material with diagnosis, theory, and observable results. The infirmary was completed and occupied as the Maryland University Hospital in 1823;<sup>1</sup> funds contributed by the faculty (Dr. Potter and others) made the building possible. It is said that he taught for almost forty years from the same ragged deteriorating yellow notes. In 1829, his battle with the janitor, who was selling spirits and playing cards with students, only increased his popularity.

Dr. Potter also held the following positions: attending physician, Baltimore General Dispensary, 1802-1805; Secretary, Medical and Chirurgical Faculty of Maryland, 1801-1809; co-founder of the College of Medicine of Maryland, 1807; Professor of Practice, University of Maryland College of Medicine, 1807-1843; Dean, the College of Medicine and the University of Maryland, 1812 and 1814; President, Baltimore City Medical Society of Maryland, 1812; President, Medical Society of Maryland, 1817; Orator, Medical and Chirurgical Faculty, 1817; attending physician, Baltimore Almshouse; Editor, *Baltimore Medical and Philosophical Lycaem*, 1811; and Editor, *Maryland Medical and Surgical Journal*, 1840-1843.<sup>3</sup>

He also contributed greatly to literature of that time. The following is his bibliography:

- *An Essay on the Medical Properties and Deleterious Casualties of Arsenic*. Submitted to the examination of the Rev. John Ewing, provost, and the trustees and medical faculty of the University of Pennsylvania on May 17, 1796 for the degree of Doctor of Medicine.
- *Fistula in ano treated by mercury*. *Medical and Phys Recorder* 1809; i:119, 125.
- The anomalous character of the measles in Maryland, 1808. *Baltimore Medical and Philosophical Lycaem* 1811; no 1: 83-8.
- The distemper epidemic of 1812. *New York Medical Repository* 1812; vi:1.
- *A Memoir on Contagion, More Especially as it Repeats to the Yellow Fever*. (Read in convention of the Medical and Chirurgical Faculty of Maryland June 3, 1817.)
- *A Memoir on Contagion, More Especially as it Repeats to the Yellow Fever*. Published by Edward J. Coale. 1818.
- Report to city authorities on the yellow fever, 1819-1820. In document on same. 1820;140.
- Edits Armstrong on *Typhus Fever*, with notes, critical and explanatory. Baltimore: J Webster, publisher, 1821; 8:468.
- Letter to Dr. James Smith on vaccination. *Inquir*. 1822.
- Cholera infantum. *Baltimore Medical and Surgical Journal and Review* 1833; i:104.
- Pneumonia biliosa. *Baltimore Medical and Surgical Journal and Review* 1833; ii:261.
- Non-identity of gonorrhoea and syphilis. *Baltimore Medical and Surgical Journal and Review*, 1833; iv:387.
- *Some Account of the Rise and Progress of the University of Maryland*. Baltimore: Joseph Robinson. 1838.
- Edits (with S. Calhoun) Gregory's *Practice of Medicine*, (2 vols) with notes and additions adapted to practice in the United States (2nd American edition from 3rd London edition). Philadelphia. 1839.
- *Notes on the Locusta Septentrionalis Americane Decem Septima*, Baltimore. 1839.

- Also contributed to books by John Armstrong (1821) and George Gregory (1826).<sup>5</sup>

Dr. Nathaniel Potter, whose portrait hangs in Davidge Hall where he once taught, died on the morning of January 2, 1843 at the age of seventy-three from a sudden and very brief illness. His obituary describes him as "a practitioner of medicine, he was remarkable for promptitude and integrity of judgment, and for the boldness and energy of his remedial measures. As a teacher, Dr. Nathaniel Potter was perspicuous and impressive, displaying in his lectures extensive knowledge and great practical good sense, rendering his subject pleasing and attractive by his native power of wit and illustrating and enforcing his doctrine by the ample resources of a profound and elegant erudition."<sup>6</sup>

He was buried in Greenmount Cemetery by the charity of a group of friends and medical associates on a cold January morning in 1843. His grave is located in Greenmount Cemetery at area six, lot ninety-six, in an unmarked grave next to his daughter, Mary Potter, who died January 27, 1894.

January 2, 1993 will mark the 150th anniversary of Dr. Nathaniel Potter's death. It is hoped that by then a suitable grave marker can be obtained so as to pay honor to a man who contributed so much to medicine and the University of Maryland Medical School.

# ***The Personality Disorder Treatment Program of Sheppard Pratt Hospital***

Very often, specialized inpatient evaluation and treatment is a critical step in the effective care of a borderline patient.

The Personality Disorder Treatment Program at Sheppard Pratt offers a combination of services that may help to untangle difficult clinical questions and facilitate your patient's continued outpatient treatment.

We offer:

- ☐ Short-term and intermediate-term specialized inpatient treatment
- ☐ Extended-term intensive inpatient treatment
- ☐ Comprehensive diagnostic evaluation
- ☐ Psychotherapy and psychopharmacology consultation
- ☐ Intensive individual and group psychotherapy provided by our staff of psychiatrists and psychologists
- ☐ Long-term treatment planning

If you would like to know more about the Sheppard Pratt approach to the borderline patient and other patients with severe personality disorders, contact the Adult Admissions Office at:

# Performing Arts Medicine:

ISSUES IN  
DIAGNOSIS AND MANAGEMENT

**A**re you a primary care physician who sees a few performers? Or do you specialize in the care of musicians and dancers? Maybe you are an allied health care professional or performer yourself who would benefit from our sessions. If you are, plan on attending the Medical and Chirurgical Faculty's conference on Friday and Saturday, January 24 and 25, 1992 at the Med Chi Faculty Building 1211 Cathedral Street Baltimore, Md.

Speakers will include Dr. Hunter Fry, an Australian expert in overuse injuries. Dr. Fry has shown continued interest in the growth of arts medicine in Maryland.

*Other speakers include:*

David Sternbach, L. C. S. W.; Richard Norris, M. D.; and committee members Emidio Bianco, M. D.; Sandra Bishop; Scott Brown, M. D.; Ruth Drucker; David Fetter; Norman Rosen, M. D.; Leo Rozmaryn, M. D.; and Charles Silberstein, M. D.

Medical  
and Chirurgical Faculty  
of Maryland

# Medical and Chirurgical Faculty's Committee on Medicine and the Performing Arts Conference

Friday & Saturday January 24 & 25, 1992

Med Chi Faculty Building  
1211 Cathedral Street Baltimore, Md

## Topics to be covered include:

- Soft tissue and overuse injuries of instrumentalists
- Epidemiology of performance related problems
- Approach to the performing artist as a patient
- Medicolegal issues in the performing arts
- Medical problems in the training of the young dancer
- Prevention and treatment of performance anxiety
- Orthotics and instrument adaptations
- Myofascial pain syndromes in the musician

There will be a panel of professional musicians covering the fields of classical, jazz, and rock music who will discuss and respond to questions regarding the musician's role in society and special career demands in their particular area. Three concurrent roundtables covering vocal medicine, dance medicine, and instrumentalists' problems will include case presentations by local experts. Steve Turley, a guitarist from Peabody Conservatory, will give a short lecture-concert.

The conference will run from approximately 12:30 to 5:00 p.m. on Friday and 8:30 a.m. to 5:00 p.m. Saturday.

The Medical and Chirurgical Faculty of Maryland is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.

## REGISTRATION FORM

Performing Arts Medicine: Issues in Diagnosis and Management  
January 24-25, 1992

**Physicians - \$50.00**

### **The Treatment of Sleep Disorders of Older People: Summary of the National Institutes of Health (NIH) Consensus Statement**

**I**t has been estimated that over half of the twenty-nine million people now over the age of sixty-five experience some disruption of sleep. These disturbances of sleep may be caused by many factors such as retirement and changes in social patterns, deaths of spouses and close friends, increased use of medications, and changes in circadian rhythms. Although changes in sleep patterns have been viewed as part of the normal aging process, new information indicates that many of these disturbances may be related to pathological processes that are associated with aging.

During aging, the amount of time spent in deeper levels of sleep diminishes, and there is an associated increase in awakenings during sleep and in the total amount of time spent awake during the night. In carefully screened, medically healthy, older subjects, there are relatively few individuals who have symptoms related to these changes in sleep and in the distribution of sleep and waking behaviors. Many older individuals, however, suffer from a variety of medical and psychosocial problems, and these are very often associated with disturbances of sleep. These include psychiatric illnesses, particularly depression; Alzheimer's disease and other neurodegenerative diseases; cardiovascular disease; upper airway incompetence; pulmonary disease; arthritis; pain syndromes; prostatic disease; endocrinopathies; and other illnesses.

In an effort to assess the current knowledge on what changes in sleep are clinically important, how sleep disorders are best diagnosed and treated, and how the public can establish good sleep practices, the National Institute on Aging and the National Institutes of Health (NIH) Office of Medical Applications of Research convened a Consensus Development Conference on the Treatment of Sleep Disorders of Older People, which was held on March 26-28, 1990. Based on scientific presentations and discus-

sions from physicians, scientists, health care professionals, and the general public, a thirteen-member panel wrote a consensus statement. Following are highlights of the panel's findings:

Diagnostic evaluation begins with the recognition of a potential disorder by patient history or physician suspicion. Screening questions should include patient satisfaction with his or her sleep; intrusion of sleep or fatigue into daily activities; and complaint by bed partner or other observers of unusual behavior during sleep. A positive response to these questions should trigger a more detailed history of the onset, severity, duration, and pattern of the complaint, and lead to a differential diagnosis. A careful medical history is needed to determine the presence and severity of concomitant disease. Prescribed medications, especially sedatives, alcohol use, and self-medication can all have a significant effect on sleep and may impair cardiopulmonary mechanisms during sleep. Psychiatric history and evaluation identify anxiety, depression, or major life events which are known to affect sleep habits or hygiene. In some cases, the use of a patient sleep log to evaluate sleep/wakefulness patterns will serve to identify rhythmic or circadian disturbances or to document the magnitude of sleep intrusion into daily activities. Appropriate physical examination will depend upon the nature of the complaint and history elicited from the patient. Given additional training and education, primary care physicians should be capable of initial assessment and management of the majority of sleep disorders presenting in the older population. When necessary, referrals should be made to individuals, or a center with recognized skills, in the indications for and application of more specialized tools and recommendations for therapy.

The goals of therapy of sleep disorders can be classified as: reducing morbidity; reducing excess mortality; and im-

### **The Treatment of Sleep Disorders of Older People: A Response**

**S**leep is a universal phenomenon, yet despite the fact that many of us spend one-third of our lives in this behavioral state, the mechanisms, function, and norms of sleep are poorly understood. There are now over 200 sleep referral centers attempting to answer these and other questions. Sleep research is in the early phases of development and the elderly population is most often underrepresented. Published work in this area largely reports results of research with sleep center

referral patients and volunteers. However, sleep complaints rank second to the common cold as a reason for visiting the doctor.<sup>1</sup> Furthermore, there were twenty million prescriptions for hypnotics written in 1985, with 66 percent more prescriptions written for those over the age of sixty-five as compared with the forty to sixty year age group. It is axiomatic that the quality of life of elderly people depends on maintenance of maximum daytime alertness. Yet, the

proving quality of life for patient and family. The two primary types of complaints or disorders, for which there is evidence to suggest that treatment is beneficial are: the hypersomnias, primarily represented by obstructive sleep apnea; and the insomnia complaints, which can be due to a variety of psychiatric and medical disorders.

Obstructive sleep apnea is a potentially reversible cause of daytime hypersomnia, which may be associated with co-morbid conditions and even excess mortality. Effective treatment is available for many patients. At the present time, considerable reliance is made on clinical judgment to initiate a therapeutic trial or regimen. These include weight loss; avoidance of alcohol, sedatives and hypnotics; the avoidance of the supine sleeping position; and management of nasal and nasopharyngeal disease. The mainstay of treatment is the use of nasal continuous positive airway pressure (CPAP). Uvulopalatopharyngoplasty has been reported to be successful when other measures have failed or are unacceptable. In all therapeutic interventions, there should be long-term outcome assessment.

Complaints of insomnia are very common in the older patient. Insomnia is a symptomatic expression of a constellation of medical conditions that are not entirely related one to another. Insomnia may be of psychiatric, pharmacological, or of medical origin. Since insomnia has many causes, the indications for treatment are dependent on the etiology. A thorough medical evaluation is essential prior to initiating treatment. Indications for therapy will be driven by the underlying cause and severity of symptoms. Hypnotic medications should not be the mainstay of treatment of insomnia. Short-term intermittent use of hypnotics and sedative tricyclics may be useful for temporary problems such as bereavement, dislocation, and situational anxiety. There are no studies which demonstrate their long-term effectiveness. Given the changes in drug metabolism associated with increasing age, all medications should be used with caution, especial-

ly those with long half-lives. Other general measures, such as sleep hygiene, can be used as adjuncts to treatment of the specific causes of insomnia and tried when the cause is not clear or is unspecified. Sleep hygiene measures include regularization of bedtime, generally later rather than earlier; the use of the bedroom primarily for sleeping; exercise; avoidance of alcohol and caffeine; reduced evening fluid intake; and in the case of esophageal reflux, elevation of the head of the bed.

Education about sleep and sleep disorders of older people must be directed at all segments of the population. Physicians and medical students, nurses, social workers, and other allied health professions need particular educational emphasis. They should be informed of the concepts of sleep physiology and pathophysiology, and assessment and differential diagnosis. For audiences unfamiliar with the issue of sleep and the older person, the magnitude of the personal and societal toll in accidents, health, and unhappiness must be conveyed. Other key points include proper use of medications, preventive health measures, and good sleep hygiene practices. Sleep complaints should be taken seriously and appropriately treated. Troubled sleep particularly affects the lives of older people. It can exacerbate illness and cause frustration, confusion, and depression. Many people accept sleep disturbances as part of the normal aging process. It is necessary to determine what is normal and what is disease. Basic research, especially using the powerful new techniques of modern biology, is critical to the understanding of the brain mechanisms of sleep and sleep disorders associated with aging.

Free single copies of the complete *NIH Consensus Statement on Treatment of Sleep Disorders of Older People* may be ordered from the Office of Medical Applications of Research, National Institutes of Health, Building 1, Room 260, 9000 Rockville Pike, Bethesda, MD 20892, (301-496-1143).

daytime consequences of hypnotic medications in the elderly include impaired cognition, reduced psychomotor function, and a much higher prevalence of injurious falls.

The *National Institutes of Health (NIH) Consensus Statement* responds to key questions related to this issue. The major conclusions of the consensus group were:

—Typical changes in the pattern of sleep occur during aging. Less time is spent in deeper levels of sleep, and there is an associated increase in awakenings during sleep.

- The high incidence of concomitant medical and psychiatric illness contribute to sleep disturbances.
- Many prescription drugs taken by the elderly have a primary disruptive effect on normal sleep and a secondary effect on sleep patterns because of side effects.
- Primary care physicians, in general, should be capable of initial assessment and management of the majority of sleep disorders presenting in older people.
- To determine etiology, the evaluation of sleep complaints should be approached in a comprehensive fashion.

- Polysomnography and multiple sleep latency tests are indicated when the diagnosis of sleep-related breathing disorders, narcolepsy, or periodic movements of sleep is suspected.
- The indications for the treatment of sleep disorders is not well studied. There is evidence that treatment is beneficial for the hypersomnias and some of the disorders of initiating and maintaining sleep.
- Obstructive sleep apnea is an important condition to identify since it may be associated with significant co-morbid conditions and excess mortality; treatment is recommended for more severe degrees of this disorder. Objective indices of severity include a high index of respiratory disturbances per hour, repetitive episodes of oxygen desaturation, and an abnormally short sleep latency.
- Insomnia is a symptomatic expression of a constellation of medical conditions that are not always related to one another. It has many causes, and indications for treatment are dependent on etiology.
- Periodic movements of sleep (PMS) appear to be very common in the elderly. However, there is insufficient evidence to indicate whether the disease state or its treatment affect morbidity.
- Insomnia may also be related to circadian rhythm disturbances. Such alterations happen during shift work or changes in daily routine that may occur with institutionalization, for example.
- General measures to improve sleep hygiene can be used as adjuncts to treatment of insomnia. These include regularization of bedtime, the use of the bedroom primarily for sleeping, reduction in evening fluid intake, avoidance of pre-sleep alcohol and caffeine and, in the case of esophageal reflux, elevation of the head of the bed.
- Nasal continuous positive airway pressure may be successful for treatment of hypersomnia. Other therapeutic interventions, such as loss of excessive weight, avoidance of alcohol, sedatives and hypnotics, and the avoidance of a supine sleeping position, may also be helpful. There is insufficient evidence to suggest that surgical procedures, except in individual cases, are indicated or beneficial.

It is abundantly clear that sleep-related disorders and complaints in older people pose a significant problem. Presently,

controversy exists concerning the causes, diagnosis, assessment, and specific treatment of sleep disorders in the elderly. Current knowledge is less than comprehensive about changes in sleep and wakefulness as a function of aging or as a result of disease. There is need for basic epidemiologic descriptive studies, natural history cohort studies, standardization of data collection, and outcome studies. The information developed in these studies will aid in the understanding of the natural history, etiology, and prevention of sleep disorders. Sleep, like pain, should be regarded as a symptom, often with a treatable underlying cause. There is no evidence that long-term or continuous use of benzodiazepine hypnotics improves length of time asleep or quality of sleep. These medications are indicated for short-term use for temporary problems such as bereavement or situational anxiety. Given the changes in drug metabolism associated with increasing age, these medications should be used with caution. As in other conditions, a rational approach to diagnosis is required before empiric therapy, which may be harmful, is instituted.

Guidelines such as those developed by the *NIH Consensus Conference on Sleep Disorders of Older People*<sup>2</sup> are tools for clinical decision-making in practice. It is clear, however, that "the appropriate use of guidelines requires that they be based on sound science and serve the ethical purpose of making the significance of choice clear to physicians and their patients."<sup>3</sup> The NIH guidelines present reasonable options available for these disorders. However, it is important that patients' preferences are considered in deciding investigation and treatment courses, and these preferences can rarely be taken into consideration by meetings of experts in the field. To ensure that patients receive the most effective treatment, physicians must consider patients' treatment preferences as well as informing them of the scientific basis of the available options.

### Gastric Tumors

A variety of tumors arise from different histologic tissues that constitute the wall of the stomach. These lesions can be silent and are found incidentally at surgery or autopsy or can become symptomatic and be diagnosed clinically. Symptoms do not differentiate benign from malignant tumors, and they may vary from mild epigastric discomfort to pain, bleeding, obstruction, and loss of weight. The availability of fiberoptic gastroscopy and special upper gastrointestinal (GI) radiological studies allows visualization of the exact location and extent of the lesion in over 90 percent of cases and permits biopsy of the tumor. Computed tomographic (CT) scanning of the abdomen has been helpful in establishing the extent of the disease — especially outside the stomach and in the retroperitoneal space or liver metastases in malignant lesions — prior to surgical intervention. A CT scan also can be used in follow-up of patients and for controlled needle biopsy to establish a tissue diagnosis. Some malignant tumors may produce tumor markers such as alpha-fetoproteins, but mainly they produce other carcinoembryonic antigens (CEA). Such markers can be used for the follow-up of these patients by periodically comparing the preoperative levels with the postoperative values.

#### Mucosal Tumors

**Polyps.** These are the most common benign mucosal lesions and are especially common in the elderly. There are two main varieties. The regenerative type, also known as hyperplastic or inflammatory, comprises 75 percent of gastric polyps. These are usually multiple and correspond to an entity described by Menetrier as *polyadenomes polypeux*; there is approximately an 8 percent chance of co-existing carcinoma.<sup>1</sup> The adenomatous polyp is usually single, large, and located in the antrum; almost 60 percent of these patients have a coexisting carcinoma.<sup>2</sup> A single polyp can be snared via endoscopy and thoroughly studied histologically. The patient has to be observed for recurrence and cancer. Multiple polyps must be treated by gastrectomy. If the disease is localized, partial gastrectomy is performed; however, if it is widespread throughout the stomach or is persistent Menetrier's disease, total gastrectomy is in order.

**Carcinoma.** Adenocarcinoma is the most common malignant gastric tumor. The most common precancerous lesions are severe dysplasia of the mucosa, atrophic gastritis, intestinal metaplasia, and severe adenomatous dysplasia. Among the risk factors are duodenogastric reflux of over ten years' duration, nitrosocompound intake in the diet, adenomatous polyps, achlorhydria, and immunologic gastritis as occurs in pernicious anemia. It is more common in the sixth decade of life and more common in men, with a male to female ratio of 2:1. Endoscopy and detailed upper GI series examinations

have yielded a 5 percent detection rate of early carcinoma, localized to the mucosa and submucosa only, with no lymphatic spread. Surgical cure is over 90 percent in those cases. The primary treatment for all gastric carcinoma is surgery — radical subtotal gastrectomy or radical total gastrectomy. Palliative gastrectomy plays a role in prolonging survival.

Two chemotherapy programs have been claimed to be effective in metastatic disease. These include 5-fluorouracil (5-FU) + Adriamycin + mitomycin-C (FAM), and 5-FU + cytosine arabinoside (Ara-C) + mitomycin-C, with a 20 to 50 percent response rate of twenty to thirty weeks' duration. Adjuvant chemotherapy, utilizing 5-FU plus methyl-CCNU (lomustine), administered four weeks after curative surgery to prevent or delay recurrences and metastases, showed some improvement in survival in one study and no benefit in another.<sup>3</sup>

Squamous cell carcinoma is usually encountered at the cardiosophageal junction and is of esophageal origin, with secondary invasion of the proximal end of the stomach.

#### Intramural Tumors

Tumors originating within the stomach wall proper can be categorized according to their origin.

**Smooth Muscle Tumors.** Leiomyoma is the most common benign tumor. Sometimes it cannot be differentiated from malignant leiomyosarcoma and leiomyoblastoma. These tumors tend to protrude intraluminally with stretching of the overlying mucosa and occasional mucosal ulceration. Small tumors are treated by wedge resection with 2 to 3 cm margins. Larger tumors are treated by partial gastrectomy. The malignant variety is treated by radical partial gastrectomy. Metastases are usually bloodborne and are treated mainly by chemotherapy: doxorubicin (Adriamycin), actinomycin-D (Cosmegen), and vincristine (Oncovin) or a combination of these.

**Malignant Lymphomas.** These may be primary tumors of the stomach or secondary to lymphomas of lymph node origin, with direct invasion from neighboring lymph nodes or by metastases. They usually protrude intraluminally, causing stretching of the mucosa; later, they ulcerate and invade the mucosa. Primary lymphomas of the stomach are usually histiocytic or of poorly differentiated lymphocytic type, i.e., non-Hodgkin's type. Lymphomas of the stomach should be surgically resected to eliminate the site of gastric lymphoma prior to the initiation of radiation therapy or chemotherapy. This is to avoid sloughing of the tumor site that may result in bleeding or perforation and peritonitis. During surgery, the extent of the disease should be determined. Pseudolymphoma is a benign lymphoid hyperplasia that should be differentiated from lymphoma and plasmacytoma of the stomach, a malignant systemic disease.

## Maryland Oncology Newsletter

**Lipomas.** These are rare tumors and are treated by local excision.

**Carcinoid Tumors.** These are usually argyrophilic, are a derivative of the foregut carcinoids, and can be associated with multiple endocrine adenomatosis. They can be single or multiple. Some of these tumors are secretors, giving rise to clinical symptoms of the carcinoid syndrome. Such tumors are yellow or tanned submucosal nodules. Surgery is the primary treatment for these tumors even in the presence of metastases. Small tumors of up to 1 cm can be locally resected. Tumors greater than 1 cm should be treated as carcinoma in the absence of metastases. Patients with metastases who have the carcinoid syndrome can be treated symptomatically according to the clinical presentation.

Carcinoid tumors of the stomach may be associated with peptic ulcers or diarrhea. Flushing is common and usually occurs after meals as a vivid red discoloration which is patchy initially and then becomes confluent. Flushing can be controlled by alpha-adrenergic blockers such as phenoxybenzamine (Dibenzylamine): 10-20 mg per day to block kinins. Also, prednisone, methyl dopa (Aldomet), chlorpromazine (Thorazine), and antiprostaglandins such as aspirin and indomethacin (Indocin) have been beneficial. Actual tumor control by chemotherapy with 5-FU and streptozocin (Zanosar), or cyclophosphamide (Cytosan) and streptozocin, gives a 30 percent positive response rate for a short duration.

**Glomus Tumors.** These are rare benign tumors formed of fibrovascular tissue and are treated by local excision.

**Ectopic Pancreatic Tissue.** These are usually present in the pyloric region and may cause obstruction. They are treated by surgical resection.

### Serosal Tumors

**Peritoneal Mesotheliomas.** These tumors are rare. The visceral peritoneum of the stomach can be the site of benign solitary tumors or can be involved in the diffuse malignant type. Surgical resection should be carried out if at all possible. Doxorubicin (Adriamycin) is being tried in the treat-

ment of advanced malignant mesotheliomas with varying results.

**Metastatic Carcinomas.** Carcinomas, particularly breast, lung and melanoma, also can invade the gastric serosa as part of generalized peritoneal spread. This is commonly encountered from ovarian, breast, and lung cancers and from melanoma. Such tumors can invade the stomach wall and penetrate it throughout its thickness. Surgery is indicated for palliation, but principal therapy is directed to controlling the primary disease.

**Desmoid Tumors.** These unusual tumors also may invade the stomach. They should be resected with safety margins in the hope of preventing recurrences. Multiple recurrent tumors that are not resectable can be treated by Adriamycin.

Serosal tumors can deeply invade the stomach wall, displacing the mucosa which may later ulcerate intraluminally.

University of Maryland

*Tumor conferences are held weekly on Tuesday between 8 and 9 am in Room NBW74 at the University of Maryland Medical System. Physicians are welcome to attend this open meeting and to present cases and pathology slides. Call 301-328-5224 by noon Monday to be placed on the schedule. Surgical Oncology Program, University of Maryland Medical System, Room N13E02, Baltimore, MD 21201.*

### Physician Placement Services

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

**Physician Placement Service**  
1211 Cathedral St., Baltimore, MD 21201-5585  
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland. **MMJ** announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

## A Clinical Moment With... Diabetes

### Alternatives to the Injection of Insulin

*Doctor, I understand that my blood glucose can no longer be controlled with oral agents or sulfonylurea drugs because I am unable to control my habit of eating excessively and irregularly. You recommended that I begin insulin injections last month and I did, but continuing that routine is almost impossible. What about nasal inhalation of insulin, insulin in pellets to be taken orally, or the "no needle" spray of insulin of which I have read? What about the surgical procedures done to the intestinal tract to cause weight loss? I have even heard of wiring the jaws to prevent excessive eating. Even though I take insulin injections with a #29 needle so that it doesn't hurt, the process is too emotionally disturbing to continue. I am in constant fear of having a hypoglycemic reaction and passing out.*

In regard to queries of this type, physicians need to review options to taking insulin injections with their obese patients who have non-insulin dependent diabetes. They need to be told that in this type of diabetes, there is an adequate amount of insulin in the body, but that the patient's obesity prevents the insulin from lowering the blood glucose and being properly utilized. The sulfonylurea drugs will help the insulin become more effective and if the patient is cooperative with exercise and a proper meal plan, using one of these agents may be effective for many years.

If the patient is not able to follow a proper meal plan, the sulfonylurea drugs will not have a fair trial. The next option is administration of insulin. Nasal insufflation of insulin, slow release of insulin from fatty pellets in the intestine, and insulin injections by needleless "jet" or "hypospray" are all alternative methods to the subcutaneous injection. The first two are really experimental and clinical use preparations are not available. The "jet" injector method is available, although it is less accurate and more painful, expensive, and difficult than the subcutaneous method. For immunization therapy on a large scale, however, this method of injection is useful. I

have had several patients use this method briefly, but all elected to return to the syringe and needle technique of their own volition.

The surgical techniques for weight control such as stapling, intestinal bypass, or balloon inflation in the stomach have each had their period of popularity but are rarely used at present. Even if one of the surgical techniques were to be considered, the patient should have extensive psychiatric screening and support throughout the program. A surgical alteration is not a permanent procedure, but will be reversed at some future time.

It may be necessary to be forthright and direct with some patients. For example: "Let us accept a few facts. You have never lived a life of any degree of regularity, have never tried to exert any willpower over your eating, and have never wanted to exercise. Your affluent and easy life has been a great disadvantage to your health. Your need to take insulin injections is the first time in your life that you have not been able to buy a cheaper or easier way to get around a problem. If you will accept that you have poor living habits and are willing to seek help in the form of group counseling,\* behavior modification and psychiatric support, I believe insulin injections can be discontinued after a month of cooperative therapy. It does not mean that you have to do it alone. It means that you need to look after your own health. If you do that and also enlist the aid of health care professionals and your family, better health is bound to follow. Otherwise, you must become resigned to take insulin injections for the foreseeable future."

DEWITT E. DELAWTER MD  
Editor

\*An ideal group consists of ten to twelve persons meeting at least once weekly for a period of three to six months and led by an experienced staff person under the supervision of a psychiatrist or psychologist. The programs advertised extensively on radio and television are not to be recommended. ■

# We Need A Doctor In The House

When the Maryland General Assembly convenes in Annapolis for its 1992 session, the Medical and Chirurgical Faculty will be there. Since 1964, Med Chi has staffed the first aid facility operated during the 90-day legislative session. Come join us at the state capitol building, see the laws being made first hand. One doctor a day is all that is needed to care for the public, the legislators, and their staffs. Take advantage of the opportunity to donate something priceless, your time.

Please detach the postcard located at the top of this page, fill it out and mail it. A confirmation card will be sent to you explaining the details. You will be carrying on a tradition established by the medical community for the people of Maryland.

## Doctor of the Day 1992

Note: All Monday dates are evening sessions, beginning at 4:00 p.m. and ending at 9:00 p.m. For more information, call Bernadette LaRue at Med Chi's Legal Department, 301-539-0872 or call toll free in Md. at 1-800-492-1056.

Your time can make a difference.

### Holiday Sharing Card Benefits the American Medical Association Education and Research Foundation

The American Medical Association Education and Research Foundation or, as we know it, AMA-ERF, has become the major philanthropic institution of organized medicine in the United States. Of the many worthy causes to which we contribute yearly, both at national and local levels, few can match AMA-ERF in providing such lasting and important benefits for medicine in Maryland and the public at large. We, the medical family, must respond to the needs of our medical schools in their efforts to assure the delivery of quality medical education to our physicians of tomorrow, and support the advancement of research in many areas including alcoholism, drugs, arthritis, neuromuscular diseases, cardiovascular diseases, and pulmonary diseases.

*But... not by contributions alone!* Although AMA-ERF is classified by the Internal Revenue Service as a 501(c)(3) and a 509(A)(1) organization indicating that gifts are regarded as charitable contributions to a public foundation, much time and diligent effort are expended by medical auxiliaries nationwide in raising funds to supplement the contributions.

By far, the most lucrative and successful national project, adopted by many state and county medical auxiliaries, is the **Holiday Sharing Card**. This is a flexible tool for any major holiday or occasion, although it is customarily used during the Christmas season.

The mechanics of this project are easy but, as with any major venture, they do require advance preparation, generally beginning in September.

All basic costs associated with the **Holiday Sharing Card** (the card, postage, printing, etc.) are county auxiliary budget items. The cost to the participant is variable, however. Thirty dollars is the estimated minimum cost for an individual to

send cards to other medical friends within the county. All donor checks must be made payable to AMA-ERF.

The card is carefully selected by each county auxiliary president and the AMA-ERF committee chairperson. It may be a commercial card, or one designed by a talented physician or auxiliary or, for a light-hearted touch, a child's holiday drawing. (A conscious effort is made to ensure that card and message are acceptable to all religions.)

An appropriate letter or invitation is circulated to all members of the local medical community, generally including nonmarried physicians, widows, widowers, and retirees. Included in the text of the invitation is the deadline for returns, allowing sufficient time for processing donations before the national deadline of December 1.

It is the donor's privilege to designate the contribution to the medical school of his or her choice; when designating the Student Assistance Fund, the medical school must also be indicated. Contributions for research grants are accepted, and distribution is determined by the Foundation's Board of Directors. All contributions are generally acknowledged by the Foundation.

There has, as yet, been no official news release from national **Holiday Sharing Card** for the 1990-91 year. However, during the 1990 holiday season, eight Maryland county medical auxiliaries and the State board raised a total of \$16,186.

To the members of the medical family, we extend our sincerest thanks to each and all for your continued generosity and support of the AMA-ERF at holiday sharing time.

ELIZABETH A. LINHARDT

State Chairperson, AMA-ERF, 1990-91

## MARYLAND

*The Auxiliary always welcomes new members.*

*Auxiliary members support the physicians and are recognized for their contributions to health, education, and the promotion of quality health care in Maryland.*

### The Holiday Sharing Program of the Auxiliary to the Anne Arundel County Medical Society: 1980-1991

**T**he *Holiday Sharing* program is a joint effort between the Auxiliary to the Anne Arundel County Medical Society and the Department of Social Services, and has been in operation since 1980. The main purpose of this program is to match donors with needy families at Thanksgiving and Christmas. Cards are mailed to all AFDC (Aid to Families with Dependent Children) families in October asking them to register for the program by providing their children's names, ages and sizes, and to give permission to share this information with a donor.

Our donors include churches, schools, businesses, civic organizations, government agencies, and individuals. Letters are mailed to all previous donors each September with a tear-off sheet enabling them to let us know how many families they wish to help. An effort is made to match donors with families in their geographic area. All donors take care of shopping and delivering to their assigned families. Most of the assistance consists of food baskets and toys.

*Holiday Sharing* has grown to almost unmanageable proportions. During the 1990 holiday season, over 4,000 families were logged in through our program. As the project has developed, several large helping agencies, such as the Salvation Army, the St. Vincent de Paul Societies, the Jaycees, and other civic groups, clear their clients' names with us before giving them assistance. Over the years, it was sometimes amusing but also very frustrating to discover the few clients who ended up every holiday with a living room full of food baskets. *Holiday Sharing* now acts as a clearing-house for all of Anne Arundel County and helps to avoid duplication of effort. This results in a fair sharing of all the assistance available from all donors. It also satisfies a donor's need to know that his or her generosity is well and fairly distributed.

In 1989, the Lions' Club of Annapolis joined forces with *Holiday Sharing* and provided toys for 1,200 children. Tags were placed on Christmas trees at all Farmers National Banks. Customers of the banks took these tags and returned them with a new wrapped gift. Annapolis Lions' members collected over 2,400 gifts and brought them to two locations. Many of these gifts were delivered by our large donor groups with their food baskets and most were distributed to the children at Christmas parties at several housing projects.

Also beginning in 1989, Santa Claus Anonymous gift certificates were mailed to 3,800 children throughout the county. These were in the amount of \$10.00 and enabled parents and children to shop for gifts and clothing.

*Holiday Sharing* receives several thousand dollars each year. These funds are used for gift certificates for food and toys for families requesting assistance at the last minute and for special needs identified by social workers. Each year, we are usually able to assist with rent payments, thus helping to prevent eviction for several families. Funds have also been used to help with heating bills and, at one point, to repair a furnace for an elderly couple. In 1990, our new county executive, Robert Neall, took a personal interest in *Holiday Sharing* and was instrumental in obtaining support from the Anne Arundel Trade Council; several members of this group made very large donations resulting in a record total of \$24,000. Because of our economy in 1990, we were receiving many more calls for help than in previous years. Many families were coming to Social Services for the first time in their lives. The extra funds enabled us to help more people than in previous years.

As an adjunct to *Holiday Sharing*, Sarah's House Professional Courtesy Fund was set up in 1989. Letters were mailed to all physicians and dentists in the county requesting that, in lieu of sending a thank you gift to a colleague, they make a donation to the homeless shelter. We have set up an after school tutoring program for the children at Sarah's House and this year began construction of a small park/playground area. Families often stay at the shelter for several months and our goal is to make the lives of the children as normal as possible until they are relocated to their new homes.

This project begins in September each year and involves fifteen to twenty volunteers working a total of 600 hours. In January, thank you letters are sent to all donors, a statistical report is prepared, and all donor cards are filed to be used the following year. Letters are sent to editors of our two local newspapers, giving us an opportunity to thank them for related publicity and to highlight many of our donors. Each year there are twelve to fifteen articles published relating to *Holiday Sharing*; our auxiliary is usually mentioned as the moving force behind the project.

We are seeing an increase in the number of requests for help from senior citizens who are referred to us by the Department of Aging and a social worker. We expect 1991 to be a very demanding year and hope to meet the challenge and continue to expand our program.

IMELDA C. HERZINGER  
Chairperson, *Holiday Sharing*  
Auxiliary to the Anne Arundel County Medical Society

## Board of Physician Quality Assurance Actions

**In the Matter of  
Seward Boyd, Jr. DO  
Before the  
Maryland Board of  
Physician Quality Assurance**

**Surrender of License**

February 11, 1991

Dear Dr. Weiner and Members of the Board:

Please be advised that, in accordance with the understanding and agreement reached between myself and the Board of Physician Quality Assurance (the Board) on January 9, 1991, I have decided to surrender my license to practice medicine in the State of Maryland, license number H36148. I understand that I may not give medical advice or treatment to any individual, for compensation or otherwise, and cannot prescribe medications. In other words, I understand that surrender of my license means that I am in the same position as an unlicensed individual. This decision to surrender my license to practice medicine in the State of Maryland is IRREVOCABLE and public.

This Letter of Surrender shall become a public document and shall become effective immediately upon its acceptance by the Board, that date being the date on which the Board accepts this Letter of Surrender.

My decision to discontinue the practice of medicine in the State of Maryland and to surrender my license has been prompted by an investigation of my practice by the Board. This investigation revealed the following:

1. That on three occasions, I had taken and failed to attain the necessary score required to pass the Federation Licensing Examination (FLEX), which resulted in the denial of my application for medical licensure before the State Medical Board of Ohio on three separate applications, dated August 18, 1982, February 10, 1984, and August 13, 1984.
2. That on or about September 4, 1985, I was found guilty after entering a plea of "no contest" in the Lyndhurst Municipal Court, Cuyahoga County, Ohio, in the matter of *City of Richmond Heights v Seward Boyd*, case number 85CRB439, of practicing medicine or surgery, or any of its branches, without a certificate from the Ohio State Medical Board, in violation of Ohio Revised Code (ORC) §4731.41.

As a result of this conviction, I was sentenced to a term of imprisonment of ninety days, execution of which was suspended in its entirety; and was placed on probation for a period of one year; and was fined \$1,000, of which \$500 was suspended.

3. That on or about September 10, 1986, I was found guilty after entering a plea of guilty in the Court of Common

Pleas, Cuyahoga County, Ohio, in the matter of *State of Ohio v Seward J Boyd, Jr.*, case number CR-205354, of attempted trafficking in drugs, to wit, Tylox, Percocet and Percodan, all classified as Schedule II drugs, during the period January 1983 to June 1985, in violation of ORC §2923.02 and §2925.03.

As a result of this conviction, I was sentenced to a term of imprisonment of one month, execution of which term sentence was suspended; and was placed on probation for a period of six months; was fined \$150.00; and was required to pay court costs.

4. That on or about December 5, 1987, I applied for medical licensure to the Board of Medical Examiners of the State of Maryland, and willfully failed to disclose certain material facts requested in the application, including the criminal convictions relating to the practice of medicine described in sections two and three above; and the fact that I had been denied licensure in the State of Ohio on three separate occasions after having taken the FLEX examination, as described in section one above.
5. That on or about June 9, 1988, I was denied medical licensure by the Composite State Board of Medical Examiners of the State of Georgia, based on the Official Code of Georgia Annotated, §43-34-37(a)(3) and (7) (citing conviction of a crime, issuing illegal prescriptions, practicing medicine without a license, and engaging in unprofessional conduct).
6. That on or about February 4, 1988, I was found guilty after a two day court trial in the Court of Common Pleas, Lorain County, Ohio, in the matter of *State of Ohio v Seward Boyd, Jr.*, case number 33989, of knowingly and unlawfully engaging in the practice of medicine without a certificate from the Ohio State Medical Board during the period July 1985 to November 4, 1986, having been previously convicted of practicing medicine without a license on or about September 4, 1985, all in violation of ORC §4731.41, a felony in the fourth degree.

As a result of this conviction, I was sentenced to a term of imprisonment of one year, execution of all but fifteen days incarceration suspended; and was placed on probation for three years, to end May 13, 1991; ordered to pay a fine of \$1000.00; and ordered to perform 100 hours of community service work.

7. That on or about September 30, 1988, I applied for renewal of medical licensure with the Board, and willfully failed to disclose certain material facts requested in the application, including the fact that disciplinary action had been taken against me by a state board (involving the denial of my application for licensure in the State of Georgia described in section four above; and that I had been convicted in the State of Ohio of knowingly and unlawfully engaging in the practice of medicine without a certificate, as described in section six above.

## Board of Physician Quality Assurance Actions

8. That on or about August 11, 1989, disciplinary action against my license to practice medicine in the State of New York was taken by the New York State Board of Regents, by Order Number 9066, in which I was found guilty of unprofessional conduct within the meaning of NY Educ. Law, §6509(5)(a)(iii) (McKinney 1985).

As a result of this disciplinary finding, my license and registration to practice as a physician in the State of New York was suspended for a period of five years; with the execution of the last four years stayed at which point a four-year period of probation was imposed.

9. That on or about January 8, 1990, I willfully failed to disclose certain material facts requested as part of an application for hospital staff privileges at Naval Hospital, Patuxent River, Maryland. In my application, I failed to disclose the actions taken against my license in the State of New York (as described in section seven above); misrepresented that I had licenses in good standing in Ohio and New York; and failed to disclose that I had been convicted of practicing medicine without a certificate in Ohio (as described in sections two and six above). I withdrew my application for hospital privileges on or about January 24, 1990, while under investigation by the Naval Hospital credentials committee.

10. That on or about September 1, 1990, I applied for renewal of licensure with the Board and willfully failed to disclose certain material facts requested in the application, including the fact that a state licensing board had taken disciplinary action against my license (involving the suspension of my license in New York, as described in section eight above); and that I had voluntarily withdrawn my position from a hospital while under investigation by that institution (involving my withdrawal from employment at the Naval Hospital after providing materially false information on my application for privileges, as described in section eight above).

On Wednesday, December 12, 1990, I received notice, through a meeting with Robert J. Gilbert, Assistant Attorney General, of the Board's vote of November 28, 1990 to summarily suspend my license pursuant to *State Gov't. Code Ann.* §10-405; and to charge me under the Maryland Medical Practice Act (the Act), *Health Occ. (HO) Code Ann.* §14-504. The pertinent provisions of the Act charged under §14-504 provide the following:

Subject to the hearing provision of §14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:

Fraudulently or deceptively obtains or attempts to obtain a license for the applicant or licensee or for another; (See HO §14-504(a)(1).)

Is guilty of ... unprofessional conduct in the practice of medicine; (See HO §14-504(a)(3).)

Is convicted of or pleads guilty or nolo contendere with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside; (See former HO §14-504(6).)

Willfully makes or files a false report or record in the practice of medicine; (See former HO §14-504(12) and HO §14-504(a)(11).)

Is disciplined by a licensing or disciplinary authority or convicted or disciplined by a court of any state ... for an act that would be grounds for disciplinary action under this section. (See former HO §14-504(22) and HO §14-504(a)(21).)

Grounds for disciplinary action under this section include:

Is guilty of ... unprofessional conduct in the practice of medicine; (See HO §14-504(a)(3).)

Is convicted of or pleads guilty or nolo contendere with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside. (See former HO §14-504(6).)

My decision to surrender my license in the State of Maryland has been prompted by my desire to avoid summary suspension under *State Gov't. Code Ann.* §10-405, and to avoid being charged under the Act, HO §14-504. The basis for summary suspension and charges against me would include the results of the investigation as described above.

I understand that the Board will acknowledge to the Federation of State Licensing Boards, and the National Practitioner Data Bank, as is required by Senate Bill 99-660, through this Letter of Surrender, and any response to inquiry, that I have agreed to IRREVOCABLY surrender my license to practice medicine in the State of Maryland. I also understand that in the event that I would apply for a reinstatement of my license in the State of Maryland, or apply for licensure in any other state or jurisdiction, that this letter, and all underlying documents, shall be utilized by the Board to the same extent as a final order which would result from a disciplinary action under the Act.

I affirm that I do not have privileges at any hospital, health maintenance organization, or other health care institution in the State of Maryland. I further affirm that I have a current Maryland Controlled Dangerous Substances Registration Certificate, 030671, expiration date June 30, 1991, issued by the Maryland Division of Drug Control; and a United States Drug Enforcement Administration (DEA) Certificate, BB0907189, expiration date July 31, 1991.

I am also currently licensed to practice medicine in the State of Nebraska, license number 59, issued August 11, 1986; and in the State of New York, license number 169521, issued March 12, 1987. I hereby acknowledge that, on the date that the Board accepts this Letter of Surrender, the Board will send a copy of this Letter of Surrender to Helen L. Meeks,

## Board of Physician Quality Assurance Actions

Director, Bureau of Examining Boards, State of Nebraska, PO Box 95007, Lincoln Nebraska 68509-5007; and to Kathleen Tanner, Director, the New York Office of Professional Medical Conduct, New York State Department of Health, 438 Coming Tower Building, Empire State Plaza, Albany, New York 12237-0614.

Before the Board accepts this Letter of Surrender as a resolution of this matter, I must present to the Board: Maryland license H36148, including the wall license, any renewal certificates and wallet-sized renewal cards; Maryland Controlled Dangerous Substances Certificate Number 030671, including any prescription pads bearing my name and any prescription ordering forms in my possession or under my control; and United States DEA Registration Certificate BB0907189. I acknowledge that on the date that the Board accepts this Letter of Surrender, the Board will send a copy of this Letter of Surrender to both the State of Maryland Division of Drug Control and the United States DEA, attesting that I am surrendering my privilege to prescribe controlled dangerous substances in the State of Maryland. I further acknowledge that I will submit a signed, executed copy of DEA form 104, Voluntary Surrender of Controlled Substances Privileges, which will be forwarded to the United States DEA.

Finally, I wish to make clear that I have consulted with an attorney before signing this Letter of Surrender IR-REVOCABLY SURRENDERING my license to practice medicine in the State of Maryland. I understand both the nature of the charges against me and also this Letter of Surrender fully. I make this decision knowingly and voluntarily.

SEWARD BOYD, JR., DO

On behalf of the Board of Physician Quality Assurance, on this 11th day of February, 1991, I accept Seward Boyd, Jr. DO's surrender of his license to practice medicine in the State of Maryland.

ISRAEL H. WEINER, MD, Chairperson  
Board of Physician Quality Assurance

## INFORMATION FOR AUTHORS INFO

Manuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201-5585. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

### Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references), with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a WordPerfect or ASCII format.

Include full name of author(s) with highest degrees and academic or professional titles.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

An introductory synopsis of approximately twenty-five to fifty words is required.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to twenty in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see *Uniform Requirements for Manuscripts Submitted to Biomedical Journals* compiled by the International Committee on Medical Journal Editors (available through the *Annals of Internal Medicine*).

Permission: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the principal author and *MMJ*.

Page proofs will be mailed to the principal or corresponding author and, if not returned by the specified date, will be considered approved as typeset. ■

### For a Special Evening

Begin or end a truly special evening in the elegant atmosphere of Med Chi's historic Krause Room.

Directly across from Meyerhoff Symphony Hall and 1 1/2 blocks from the Lyric Opera House  
Available for catered functions everyday.

For information, please call 539-0872 from Baltimore or 1-800-492-1056 toll-free from other Maryland locations.

## Eponyms II

Bart Gershen MD

Now that we've had a modest taste of common eponyms (November 1991, Vol 40, No 11), let's return to the mother of all eponyms — medicine. I should note for the record that all professions have their individual idiom, and most speak a jargon embellished with eponyms. But I assure you that medicine is immersed, saturated, brimming, and overflowing with them.

The majority of eponyms are identifiable as such — for example, **Bright's** disease or **Raynaud's** syndrome. However, there are numerous instances in which recognition is not so easy. For instance, **brownian** motion — the incessant, random microscopic movement of particles in suspension. It was first noticed in 1827 by Robert Brown, a botanist and physician, while observing pollen grains submerged in water. The phenomenon was so fascinating that it engaged the attention of Albert Einstein, who showed that the pressure exerted by surrounding water molecules caused the grains to wobble.

Incidentally, Robert Brown was also the first to publish a work on the flora of Australia, the first to distinguish between gymnosperms and angiosperms in botany, and the first to describe and name the nucleus of the cell.

Then there's the **Golgi** complex or apparatus, that cytoplasmic organelle which sits near the nucleus, manufactures lysosomes, and stores hormones within its secretory granules. It is named for Camillo Golgi, an Italian histologist, who also developed the silver nitrate method of staining nerve cells (now called Golgi cells). That discovery led to the birth of a new specialty — neurology.

**Milkman's** syndrome, spontaneous, symmetrical pseudo-fractures, was reported in 1930 by a radiologist from Scranton, Pennsylvania — Louis Arthur Milkman. It was originally described by a Swiss physician, Emil Looser, and the lesions are occasionally referred to as **Looser** zones.

**Baker's** cyst, like Milkman's syndrome, is unrelated to the food industry. It is named for William Morrant Baker, an English surgeon who operated at St. Bartholomew's Hospital and who, for many years, was Sir James Paget's assistant. In 1877, he described the herniated popliteal bursa to which his name applies. (Incidentally, **Bart's** hemoglobin — an abnormal hemoglobin having four gamma chains — is named for St. Bartholomew's Hospital where it was first detected.)

**Negri** bodies are not black. They are spherical or ovoid eosinophilic inclusions located within the cytoplasm of nerve cells, pathognomonic of rabies, and first observed in 1903 by Adelchi Negri, an Italian physician. Initially, he had been Golgi's assistant, but quickly moved to full Professor of Bacteriology at the University of Pavi. The pathologic material which formed the basis for his conclusion consisted of dogs, rabbits, and cats infected with street virus, a few

lab-infected animals, and one human — a sixty-four-year-old woman who had died of a rabid dog bite. Unfortunately, science did not have this gifted investigator very long. Six years after marrying his colleague Lina Luzzani, and at the age of thirty-six, Negri died of pulmonary tuberculosis.

Bacteria are characterized by **gram** positive or **gram** negative staining characteristics. The stain was discovered by Hans Christian Joachim Gram, a post-graduate student working with Carl Friedlander. One morning Gram accidentally spilled Lugol's solution over a bacterial slide. In attempting to wash it off with alcohol, he made his momentous discovery. (Incidentally, **Lugol's** solution, a mixture of 5 percent iodine plus 10 percent potassium iodide, was initially proposed for the treatment of pulmonary tuberculosis by Jean Guillaume Auguste Lugol. It was found not to be useful, but was thereafter effectively applied to the treatment of thyrotoxicosis by Henry Stanley Plummer, a physician at the Mayo Clinic.)

Plummer, of course, had nothing to do with Watergate. He was half the team of **Plummer-Vinson** whose syndrome consisted of dysphagia and glossitis in iron-deficient, middle-aged women.

In 1951, Dr. George Gey of The Johns Hopkins University established a cell culture from a patient with cervical carcinoma. Today, descendants of that cell line may be found in laboratories all over the world, and are employed to culture viruses. They are known as **Hela** cells — an acronym for the patient from whom they were initially derived — Helen Lacks.

In 1943, a young girl named Margaret Tracy fractured her leg. It was a severe compound fracture which, understandably, became infected. Cultures taken from the wound grew a gram positive, spore-forming rod. Shortly thereafter, a polypeptide was isolated from that organism and found to be, curiously and almost improbably, an antimicrobial substance. The bacteria which had produced this humoral paradox was *Bacillus subtilis*. It became known as the **Tracy I** strain in honor of its immediate host (or hostess). The antibiotic which emanated from that culture was logically named **Bacitracin**.

Other patients have contributed their names to eponymic history. In 1952, Rosemary Biggs and her associates from Oxford, England reported a new hemorrhagic disorder. Resembling classic hemophilia, it was also an autosomal, sex-linked recessive illness. The description was published in *The British Medical Journal* under the title, "**Christmas** Disease; A Condition Previously Mistaken for Haemophilia." A deficiency of clotting factor IX is known to be the underlying etiology, but the disease itself was named for the youngest patient in Biggs' series of seven cases — Stephen Christmas.

Similarly, factor XII was named **Hageman** factor and factor X, **Stuart-Power** factor — each for patients with the specific deficiency.

Friedlander, mentioned above, deserves some recognition for the bacterium he described in 1882 — *Friedlander's bacillus*. Today we refer to it as *Klebsiella pneumoniae*. Its genus name is derived from another outstanding bacteriologist — Theodor Albrecht Edwin Klebs, who is further known for his discovery (with Friederich Loeffler) of the *Klebs-Loeffler bacillus* — *Corynebacterium diphtheriae*. (Greek: *Koryne* — "club" + *Bakterion* — "little rod," i.e., club-shaped rods. And Greek: *diphthera* — "membrane," referring to the pseudomembrane which characteristically forms in the pharynx of infected patients.)

The term **bacillus** derives from Latin *baculus*: "a small staff or rod" — and actually means the same as **bacterium**. The genus *Spirillum* also issues from Latin: *Spira* — "a coil." The word **cocci** originates from *kokkus*, which is Greek for "grain or kernel." (The name was given to this unique organism in 1874 by Theodore Billroth, the father of modern abdominal surgery and a close friend of Johannes Brahms who frequently induced Billroth to guest conduct the Zurich Symphony Orchestra.)

The *Staphylococcus* descends from the Greek: *staphyle* — "a bunch of grapes." The *Streptococcus* is obtained from the Greek: *Streptos* — "twisted, as in a necklace or chain." But the **gonococcus** is an example of lexical error. *Gone* is the Greek word for "seed" (e.g., **gonad**). It was mistakenly presumed that the urethral discharge in **gonorrhea** was due

to the efflux of semen. (*Rheos* is Greek for "flow," therefore a "flowing of seed, or semen." The gonococcus thus having been as erroneously named as the disease it produced.)

*Rheos*, of course, may be found in countless words such as **leukorrhea** (*leukos*: Greek for "white"), **seborrhea** (*sebum*: Latin for "tallow or fat"), **galactorrhea** (*galaktos*: Greek for "milk," which also explains the word galaxy, originally assigned to our collection of local stars — the **Milky Way**), **dysmenorrhea** (Greek prefix, *dys*, denoting "abnormal, difficult, or painful" + *mensis*: Latin meaning "month"), **pyorrhea** (*pyon*: Greek for "pus"), **rhinorrhea** (*rhis*: Greek for "nose," as in **rhinoceros**, the "ceros" resulting from the Greek *keras* for "horny," as in **keratin**. The animal, therefore, is called a horny nose), and **logorrhea** (Greek: *logos* — "word," i.e., a diarrhea of words — something of which this column has occasionally been accused).

Not only is the term **menses** directly from the Latin for month (sometimes referred to as "the monthlies"), but the word **moon** is as well. In fact, **month** derives from moon and refers to the period of one lunar cycle. One may discover this relationship hidden within the expression, **honeymoon**. In early England, it was customary for the newlyweds to share a glassful of mead or honey wine each night for the first month of marriage. Thus, the harmony of their nuptials would be initiated and indelibly imprinted on the marriage. In Italian it is called *luna di miele* — month of sweetness. It is, therefore, the honey month. Or perhaps the honeymoonth.

The Roman moon was also eponymic, named for the goddess Luna. ■

## The State of Medicine in the Soviet Union

I recently led a group of emergency physicians to the Soviet Union where we met with our counterparts in emergency medicine and studied the Soviet medical system. We found wide differences between the Union of Soviet Socialist Republics (USSR) and the USA in the way technology is used, the level of technology available, the structure of the system, the priority given to medical care within the society, and the cost of medical care to the society. Despite these differences, however, we found a remarkable similarity in the dedication of Soviet physicians and nurses to the care of their patients and to the professionalism of their chosen field. An overview of our findings is presented here.

### The Soviet Union - A Patchwork of Diversity

As anyone who has not been hibernating for the last five years now realizes, the Soviet Union is a remarkably diverse and variable country. It is nothing like the monolithic uniform gray mass perceived by most Americans before the advent of *Perestroika*. The fifteen republics which make up the USSR are much less culturally integrated than the states of the United States. Many citizens from republics other than Russia do not speak Russian and national cultures range from Oriental to Western European. The Soviet economic system's insistence on centralization exacerbates this diversity. Goods, services, people, and economic activity are concentrated in the largest cities, especially Moscow, because that is where control resides. This leads to a marked contrast between rural and urban life — much more so than in the United States.

A country this size requires a large medical establishment. The Soviet Union has about twice as many doctors as the United States and more than three times as many hospitals. At the same time, however, medical care has received a much lower priority in terms of economic importance than in the United States. This is evidenced by the fact that the Soviet government spends \$96 million a day on health care, while the U.S. government spends \$135 million and the U.S. private sector probably spends two or three times that much. One result is a lack of medical technology outside urban areas.

Seventy-five percent of Soviet physicians are female. The average Soviet physician makes about 300 rubles a month, which at current exchange rates is about \$11. While at first glance this may seem an extreme hardship, one must remember that in the Soviet Union many goods and services are free or heavily subsidized. Nevertheless, in contrast to the United States, the medical profession in the Soviet Union is among the occupations with the lowest pay and status.

### Medical Education in the USSR

Soviet physicians start their medical education at around age seventeen, after graduation from secondary school. They spend seven years in medical school taking medical courses

as well as courses that would be included in a typical U.S. undergraduate education. They then do a one-year internship. After graduation from medical school, they are required to practice three years of primary care. The Ministry of Health assigns them a place and after these three years of "practical medicine," they may, if they want and are able to find a place, go on to specialize. Specialization in the Soviet Union is a much less formal or structured process than in the United States. There are few residencies of specific periods of time with definitive educational requirements. Most specialization is handled more like an apprenticeship, where the student attaches himself or herself to a mentor and spends as much time with the mentor as the student thinks is necessary to master the specialty sufficiently. These positions are virtually all in urban areas which, as in the United States, makes them even more desirable. As you might expect, such positions are relatively few and competition is fierce.

### Medical Technology in the USSR

While medical technology is extremely poor in rural USSR, in major urban areas it approaches Western standards of sophistication. However, the Soviets often use their technology in a much different way than Americans, and the differences are sometimes very interesting. For instance, in the United States there are few hyperbaric chambers — approximately one or two per major metropolitan area. In the Soviet Union, however, virtually every hospital of significant size has one or two hyperbaric chambers and they are used for a wide variety of conditions and diseases (e.g., cardiovascular accidents). These differences in the use of technology also extend to the areas of ultrasound, ultraviolet, and electrotherapy. There is much fertile ground for cooperative research here.

### Health Care Administration

Despite recent attempts at pushing authority down the chain of command, the health care system in the Soviet Union is still very centralized. The Ministry of Health in Moscow directs all health care in the Soviet Union. Through its regional administrations, it controls all of the hospitals and polyclinics in the nation. In visiting these institutions and discussing with health care administrators the problems that beset them, one can not help but notice that health care administration in the Soviet Union is exclusively a male preserve and, most frequently, the reward of surgeons who have climbed through the administrative ranks.

The centralization of health care administration, however, does lead to some beneficial situations not found in the United States. For instance, in large cities such as Leningrad and Moscow, all ambulance dispatch and hospital admissions are coordinated at a central location. Thus, whenever an ambulance calls in with a cardiac care unit (CCU) admission (since all ambulances are staffed with doctors, triage

decisions—including the hospital admission decision—are made in the field), they immediately can be directed to the nearest hospital with a CCU bed. Similarly, a sudden influx of ambulances never overwhelms a single hospital because central dispatch makes sure that ambulance arrivals are evenly distributed. The centralized administration and economies-of-scale also allow the Soviets to concentrate specialty care more so than in the United States. Whole hospitals may be devoted to cardiology or pulmonary care or a particular kind of surgery. There is no incentive for a hospital to try to be all things to all people.

The converse of this, of course, is that the concept of medical choice is unknown in the USSR. A citizen is assigned to a specific polyclinic, and that is where s(he) is expected to go for routine or urgent medical care. Hospital admissions are made only through polyclinics or ambulance arrivals, and all admissions are centrally coordinated. The individual has no choice as to physician or hospital.

### *Perestroika*

The medical changes sweeping the Soviet Union have certainly affected medical care. There is a growing acceptance of the market as a moving force in the delivery of medicine and much interest in Western models of medical care. A number of republics are trying to figure out how to adopt an insurance model of medical care whereby the employer pays for medical insurance for its workers (or, in a health maintenance organization like situation, pays a hospital directly).

In addition, fee-for-service is making rapid progress in the USSR. Statistics suggest that approximately three-fourths of

office visits and hospitalizations in the Soviet Union are accompanied by bribes to physicians for better care. Also, many cooperatives (privately owned business ventures) have hired their own medical staff—at salaries far above the typical salaries offered in state institutions.

*Perestroika* has also spawned a number of would-be medical entrepreneurs. The role model for this has been the ophthalmologist Federov, who pioneered the method of radial keratotomy for the treatment of myopia. He was so successful with his method that the government gave him a hospital in Moscow in which he established an assembly line of operating rooms to perform the procedure. Expanding even further, he outfitted a ship with operating rooms and was able to place it in the Middle East where he could conveniently cater to the desires of wealthy oil sheiks. In no time, he was a legitimate Soviet millionaire. Seeing his example, many other Soviet physicians with skills and resources in demand in the West and Middle East (e.g., kidney transplants) have taken up this idea and are working to produce new exportable medical services.

The Soviet medical system is filled with talented, intelligent people struggling to maintain their nation's health care in the face of deteriorating economic and social circumstances. Their success is certainly not a foregone conclusion, but many of them are finding creative ways to overcome the obstacles of their current system.

**THEODORE E. HARRISON MD, MBA, FACEP**

Dr. Harrison is President of the Maryland Chapter, American College of Emergency Physicians

## Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chl physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chl currently airs two sessions of Consultation:

### **Saturday Evening Consultation**

A live program

Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.

Broadcast across the country

An hour-long program

Call-in format: Physician answers questions from listeners

### **Sunday Morning Consultation**

A pre-taped program

Sunday at 7:30 a.m.

Broadcast on WBAL - AM radio

A half-hour program

Interview format: one-on-one talk with John Stupak

For more information, contact Lori Robinson at 539-0872 (Baltimore area) or at 1-800-492-1056 (toll-free from elsewhere in Maryland).

Call for Papers

# The Medical & Chirurgical Faculty of Maryland

requests papers on the theme

## *Mini-invasion & Megatreatments*

for the  
*1992 Annual Meeting*

at the  
*Omni Inner Harbor Hotel  
in Baltimore  
Thursday, Friday, & Saturday  
April 30, May 1 and 2*

Over the last few years, the use of scopes has been introduced in surgical and nonsurgical procedures for diagnosis and treatment in a wide range of medical specialties. Because scopes involve minimal incisions and very low morbidity, they are enthusiastically supported by both physicians and patients. This year, Med Chi highlights the promise of this new technology as the theme for its annual meeting: "Mini-invasion and Megatreatments."

Med Chi invites papers dealing with "Mini-invasion and Megatreatments" for consideration by Med Chi's Committee on Scientific Activity and presentation at the 1992 Med Chi Annual Meeting.

For more information call Med Chi's Office of Continuing Medical Education at 301-539-0872 or 1-800-492-1056. Deadline for submission of scientific papers is January 15, 1992.

## "We must make sure that policies are based on facts, not fears."

Dr. Paul Volberding, Researcher, University of California, San Francisco, Member, American Medical Association

Amid the rancor of politics and budget debates, the needs of the patient are often overlooked. And, it is forgotten that it is physicians who know the most about disease and the suffering of patients.

Nowhere is this more true than with AIDS.

"Throughout the history of epidemics, there has been the possibility of reactions and policy based on fear and stigma," states Dr. Volberding.

The American Medical Association (AMA) agrees. The AMA is committed to fair AIDS policies, and to supporting researchers battling not just AIDS, but the countless diseases that ravage our society.

"What impresses me most about the AMA is its

willingness to take public policy positions and its ability to influence opinion," Dr. Volberding adds.

You are invited to join Dr. Volberding and to join with him in his efforts to bring quality health care to those in need. Become a member of the American Medical Association today.

Members of the AMA are encouraged to join their state, county and specialty societies.

## Council Minutes

### Medical and Chirurgical Faculty of Maryland Council (393rd Meeting) Friday, September 13, 1991 Carousel Hotel, Ocean City, Maryland

(At press time, the minutes were unapproved.)

Council Chairperson, Marvin Schneider MD, called the meeting to order at 3:10 pm. The Council approved the minutes of its July 18, 1991 meeting.

Dr. Schneider introduced new Council members as follows:

**Montgomery County** *Donald S. Stepita MD*

*Barton J. Gershen MD*

**Somerset County** *James A. Sterling MD*

The Council approved the requests from component societies for emeritus membership for the following physicians:

**Baltimore City** *Joseph Manuel Sanchez MD*

**Baltimore County** *Andrew C. Montague MD*

**Cecil County** *Klaus H. Huebner MD*

**Frederick County** *Harry W. Gray MD*

*George A. Thompson MD*

**Montgomery County** *Hugo Arias MD*

*Ira W. Pearlman MD*

**Talbot County** *George R. Callender MD*

*John T. Craighead MD*

*Robert R. Hahn MD*

**Affiliates** *Francis I. Catlin MD*

*Bahaeddin Safavi MD*

The Council approved the requests from the component societies for waiver of dues for the following physicians:

**Baltimore City** *James F. Carow MD*

*Joel M. Cherry MD*

*Patricia A. McIntyre MD*

**Baltimore County** *Robert L. Gattuso MD*

*Charles S. Kertay MD*

*Michael E. Sherlock MD*

**Montgomery County** *John H. Bouma MD*

*Ronald R. Cameron MD*

*Ira W. Pearlman MD*

#### Report of the Liaison Committee with the Medical Assistance Program

Dr. Gary Rosenberg, Chairperson, briefed the Council on the Maryland Access to Care Program. He indicated that an Issues and Program packet had been prepared providing a copy of the final regulations and detailing the tasks necessary to implement the program. At present, implementation of the mandatory program is scheduled for 1992 and, so far, there has been very good voluntary compliance. The fee increase

for primary care providers is scheduled to take place in December, with an approximate 50 percent increase in fees.

Dr. Gary Rosenberg also updated the Council on the Provider Fee Project. At this time, there are still differences between the State and the federal government. However, correspondence received from Representative Henry Waxman to Gail Wilensky (HCFA) stated that it was the intent of Congress to allow states to bring in funds from other sources to help fund the Medicaid program and to have those funds qualify for matching funds from the federal government. Med Chi is currently working with the State to have the voucher form clarified, as well as to reach an understanding on the IRS implications of the 1099 form.

Mr. Nelson Sabatini, Secretary, Department of Health and Mental Hygiene (DHMH), will be present at the House of Delegates meeting on September 14, 1991 to speak to the House and answer physicians' questions.

#### Report of the Ad Hoc Committee on the Scope of Podiatry Practice

After the veto of the podiatry practice bill (SB 428), the Governor mandated a committee, consisting of members of the Faculty, the podiatry community, and DHMH, to meet and discuss what was needed and come together with some kind of program.

Dr. Jeffrey Witte briefed the Council on behalf of the Ad Hoc Committee on the Scope of Podiatry Practice. He reported that the Committee would probably come up with a bill to be introduced by the Governor's office. The next meeting of the Committee is scheduled for September 26, 1991. The Committee will report to Council again in November 1991.

Dr. Schneider stated that any physician who may have questions and/or comments regarding this issue may contact any member of the Committee. The Committee members from Med Chi are John C. Gordon MD, Moosa Kazim MD, Mary Meyerson MD, Richard D. Richardson MD, Jeffrey F. Witte MD, and Gerry Evans, Esq.

#### Report of the Committee on Hospital Medical Staffs

In the absence of Chairperson Victor Hrehorovich MD, Paul Stagg MD presented the Committee's report to Council.

It was moved and approved to adopt the following policy related to substance abuse in the workplace:

The Medical and Chirurgical Faculty of Maryland supports the concept that the responsibility for adopting

a hospital's policy statement regarding the drug testing of physicians resides with each hospital's medical staff.

The Medical and Chirurgical Faculty of Maryland also supports the AMA policy relating to the drug testing of physicians by providing the following guidance which coincides with the AMA Policy:

1. Med Chi recognizes the appropriate use of urine drug and alcohol screening in monitoring recovering physicians as part of a comprehensive treatment plan for chemical dependence.
2. Med Chi cautions that drug and alcohol testing of employees should be limited to:
  - a. Pre-employment examinations of those persons whose jobs affect the health and safety of others;
  - b. Situations in which there is reasonable suspicion that an employee's job performance is impaired by drug and/or alcohol use; and
  - c. Monitoring as part of a comprehensive program of treatment and rehabilitation of alcohol and drug abuse or dependence.
3. Med Chi urges hospitals and other health care institutions that utilize drug testing programs to use confirmed positive test results to motivate physicians to seek assistance in resolving their alcohol or drug problems, preferably through the Faculty's Committee on Physician Rehabilitation.
4. Med Chi reaffirms its commitment:
  - a. To educate physicians and the public about the scientific issues of drug testing;
  - b. To monitor the evolving legal issues surrounding drug testing, especially the issues of positive drug tests as a measure of health status and potential employment discrimination resulting therefrom; and
  - c. To charge the Committee on Hospital Medical Staffs to oversee existing hospital drug testing sites.

#### **Report of the Committee on Public Health**

Herman Maganzini MD, Chairperson, briefed the Council on mammography standards and x-ray assistant qualifications. He reminded Council members of the panel discussions on mammography standards and x-ray assistants that will take place on September 14, 1991 at 8:30 am. He encouraged everyone to attend along with the invited legislators who will take part in these discussions.

Med Chi will be required to report back to the Legislature in December on these issues.

#### **Report of the Committee on AIDS**

Med Chi is obligated under SB 203 to develop a practice protocol for physicians who are HIV-positive.

Dr. Gill briefed the Council on the Committee's revised protocol and asked physicians to attend the panel discussion the next morning and provide input. The protocol will be

presented to the Legislature in December 1991. This protocol was developed by Med Chi, with input from The Maryland Hospital Association (MHA) and the AIDS Commission of the Department of Health Education and Welfare (DHEW). The Board of Physician Quality Assurance (BPQA) has offered its recommendations.

#### **Report of the Committee on Managed Care and Third Party Liaison**

Donald Dembo MD, Chairperson, briefed the Council on how the Committee has expanded its agenda and become a panel for economic review.

The Committee suggested that a physician's contracting manual, similar to the one published by the California Medical Association (*Physician's Contracting Manual*), be developed to provide guidelines to doctors in their negotiations with third party carriers. Council approved the Committee's recommendation and referred the matter to legal counsel to negotiate with the California Medical Association and to determine the feasibility of creating a similar manual addressing Maryland law.

In response to the problem of independent utilization review by third party carriers and managed care organizations, the Committee recommended the creation of a mechanism to provide for binding arbitration in utilization disputes. The Committee anticipates that such a concept would be heavily utilized. The Council approved the recommendation and referred it to legal counsel. Legal counsel will report back to Council at its next meeting.

Dr. Dembo also briefed the Council on the Committee's meeting with representatives of Barton-Gillet in reference to the release of physicians' special identification numbers. After further discussions, it was moved and approved that Council would take this entire issue under advisement and have the Executive Committee review and report back to Council. A comment was made that the Scientific Activity Committee should develop a session on managed care and related contractual problems to be presented at the 1992 Annual Meeting.

#### **Report of the Ad Hoc Committee on Women in Medicine**

Due to the ever present need to recruit women physicians to participate in organized medicine and because of the special gender issues in medicine that should be addressed regularly, the Committee recommended that the Ad Hoc Committee on Women in Medicine become a permanent Med Chi Committee.

Council approved the Committee's recommendation and referred it to the Bylaws Committee for evaluation. The permanent Committee will include both female and male members.

#### **Report of the Finance Committee**

Dr. Blumberg reported on two recommendations that the

Finance Committee had presented to the Executive Committee for its approval.

Council approved the referral to the House of Delegates of the Executive Committee's recommendation to change the name of the Physician Rehabilitation Fund to Membership Services Reserve. (This fund does not include any monies from the DHMH for physician rehabilitation).

Council also approved the referral to the House of Delegates of the Executive Committee's recommendation to redesignate the \$10 physician rehabilitation line item on the dues billing to Membership Services Reserve — the purpose is to maintain funds for operational requirements.

#### **AMA Maryland Delegation - Update**

Dr. George Malouf, Sr., AMA Chairperson, expressed his appreciation to Med Chi's physicians for answering AMA's call to write to senators and congresspersons expressing their strong and assertive support of the AMA's position on the Resource-based Relative Value Scale (RBRVS).

Dr. Malouf praised all Faculty members and requested them to continue to answer AMA's calls and to become members of AMA and the Maryland PAC.

Due to the resignation of Clinton Leinweber MD as AMA Alternate Delegate for the Resident's Section, the name of Eric L. Champaine MD was submitted by the AMA Delegation to fill the unexpired term through December 31, 1992.

The Council approved the appointment.

#### **Living Will and Power of Attorney**

Dr. Breschi requested that the Committee on Professional Ethics' recommendation on the publication of a pamphlet entitled, *Living Will and Power of Attorney*, be reconsidered at this time. He also reviewed the idea of having other sources help fund this project. (The intent of the publication is to help educate doctors, which every institute will have to address come December.)

After extensive discussion, the Council approved having one copy of this pamphlet provided to each physician member, but the cost will be limited to no more than \$10,000. Means of alternative fundings are to be explored. A cover letter and response card will be included with this pamphlet, asking physicians for their comments.

#### **Adjournment**

There being no further business, the meeting was adjourned at 4:25 pm.

CAROL W. GARVEY MD  
Secretary

**Join us in a new kind  
of partnership ...  
uniting doctors,  
lawyers, teachers,  
parents, and youth  
against drug and  
alcohol abuse.**

Become part of the Maryland Doctor/  
Lawyer/Teacher Partnership Against Drugs.

As a doctor, you can use your first-hand knowledge and experience to make a difference in winning the war against drugs. Become part of a unique initiative in Maryland to bring doctor/ lawyer education teams into schools to talk about the medical and legal consequences of drug and alcohol abuse.

Also present were Executive Directors for several of the component societies (their names are listed under the appropriate county in parentheses), the Faculty's Executive Director, Angelo J. Troisi FACHE, and other members of the Faculty's staff.

### Call to Order

The meeting was called to order at 1:15 pm on Friday, September 14, 1991 by the President, J. David Nagel MD.

### Invocation and Pledge of Allegiance

Leslie R. Miles, Jr. MD, Chairperson of the Committee on Medicine and Religion, delivered the invocation. This was followed by the Pledge of Allegiance.

### Announcement

J. David Nagel MD called everyone's attention to the Rules of the House which were attached to the agenda. He requested compliance to these rules so that the meeting could proceed in an orderly fashion.

### Minutes

The Minutes of the House of Delegates' meetings held Wednesday, May 8, 1991 and Friday, May 10, 1991 were approved as written.

### Robert McAfee, M.D., Vice Chairperson of the AMA Board of Trustees

Robert McAfee MD, Vice Chairman of the AMA Board of Trustees, spoke on medical practice parameters and challenges to medicine in the 1990s. He summarized where we are with practice parameters and used the program developed in Maine as an example of how the system works. A new agency, Healthcare Policy Research, that will be making decisions about the appropriateness of therapy, was placed under the Public Health Service of the Department of Health and Human Services not the Health Care Financing Administration.

The AMA uses the term "parameter" to define therapy guidelines because "...there may be a dozen options for treatment depending on a patient's age, condition, etc., and each of these may be very appropriate." Dr. McAfee stated that practice parameters should be based on current information and be widely disseminated.

He mentioned that cardiology has had practice parameters in place since 1986 regarding the appropriateness of pacemaker insertion, and that anesthesiologists have adopted monitoring standards that have been accepted across the country. These examples of practice parameters have resulted in good quality care.

Dr. McAfee then discussed "Health Access America," the problems with health care in America, and the Medicaid system. He concluded that we need a new system that reaches those most in need.

Following Dr. McAfee's presentation, Dr. J. David Nagel presented him with a Certificate of Appreciation.

### Distinguished Guests

Delegate Leon Albin, District 11, Baltimore, who had been invited by Steven Padussis MD, was introduced by the President. He gave a short presentation during which he stated that

it was a privilege to meet with such a prestigious group and that he has always respected Med Chi for its input to Annapolis.

The President mentioned that we were also very fortunate to have had Delegates Fulton, Bonsack, and Gunns and Senator O'Reilly present at panel meetings today.

### Physician Rehabilitation Program

Nelson Sabatini, Secretary for the Department of Health and Mental Hygiene (DHMH), presented to J. David Nagel MD a check for \$304,000. This check is for the Physician Rehabilitation Program and the monies are derived from physician renewal fees to the State. The amount is based on an estimate of monies to be collected.

### Media Awards

The President announced the winners of the Sixth Annual Media Awards Program for excellence in medical journalism.

The winners were Sue Miller in the daily newspaper category for her article, "AIDS, 10 Years Later," which appeared in *The Evening Sun*; Hollis Paschen in the non-daily newspaper category for his article, "The Wounded Healer: Art Lillicrapp's Ministry at Howard County General Hospital," which appeared in the *Columbia Flier*; and Merrie Street in the radio and television category for her program, "The Cancer Nobody Talks About," which was broadcast by WPOC. None of the winners were present.

The President also acknowledged all those who participated in this year's media awards presentation and thanked all media personnel.

### Maryland Medical Journal Award

From eighty-one articles published in the *Maryland Medical Journal (MMJ)* in 1990, the Editorial Board selected the article, "Venomous Snakebites," by Drs. Barry S. Gold and Robert A. Barish as the Best Article of the Year. It appeared in the September 1990 issue of the *MMJ*. Neither physician was present to accept the award.

### Emeritus Membership

On motion by Marvin Schneider MD, Chairperson of Council, at the request of the respective component societies, and by the direction of the Council, the following members were granted emeritus membership:

**Baltimore City**  
**Baltimore County**  
**Frederick County**

*Andrew C. Montague MD*  
*Klaus H. Huebner MD*  
*Harry W. Gray MD*  
*George A. Thompson MD*

**Montgomery County**

*Hugo Arias MD*

**Talbot County**

*Ira W. Pearlman MD*  
*George R. Callender MD*  
*John T. Craighead MD*

**Affiliates**

*Robert R. Hahn MD*  
*Francis I. Catlin MD*  
*Bahaeddin Safavi MD*

### Dues Waiver

On motion of Marvin Schneider MD, and at the request of Council and the respective component societies, the following members were granted dues waivers:

#### Baltimore City

*James F. Carow MD*

*Joel M. Cherry MD*

*Patricia A. McIntyre MD*

#### Baltimore County

*Robert L. Gattuso MD*

*Charles S. Kertay MD*

#### Montgomery County

*Michael E. Sherlock MD*

*John H. Bouma MD*

*Ronald R. Cameron MD*

*Ira W. Pearlman MD*

Dr. Schneider noted that Richard Johnson MD, whose name had been submitted by Allegany County for a dues waiver, has since died.

### Report of Council

Marvin Schneider MD summarized many of the issues addressed by the Executive Committee and Council since the Annual Meeting in May; more than fifty committee meeting minutes and reports have been acted upon since then. He mentioned that the full report was available in an issue packet.

Dr. Schneider stated that the Faculty had contacted Congress and HCFA, and has testified on the proposed medical and surgical regulations on the Resource-based Relative Value Scale (RBRVS); this is a tremendous problem and the Council/Executive Committee will continue to work on it.

Regarding the Medicaid's Provider Fee Program, which Dr. Rosenberg will discuss in more detail later, the 1099 form is still a problem. Dr. Schneider mentioned that the bookkeeping issue has been difficult to resolve and that Med Chi is continuing to work with DHMH to resolve the problems.

Dr. Schneider also stated that four peer review resolutions have been introduced since the Annual Meeting dealing with: the reaffirmation of the Faculty's role in peer review; opposition to an optional referral of standards of medical care cases to the Faculty; opposition to any modification of the Faculty's role in the Board of Physician Quality Assurance (BPQA) nomination progress; and opposition to public access to information about physicians under investigation or charges.

In response to a new request for funding for Healthcare Credentials Verification, Inc., a loan of \$75,000 was approved by Council for a period of five years at 10 percent annual interest.

The Council supported the Medical Staff of Harbor Hospital Center in its dispute with the hospital's administration.

A draft practice protocol for physicians with human immunodeficiency virus (HIV) was referred to the Reference Committee and will be discussed later at this meeting. The Council went on record as asking the BPQA not to ratify its Executive Committee policy proposal regarding a physician knowingly infected with HIV or hepatitis B virus (HBV) performing exposure prone or invasive procedures.

The Council continues to register its dissatisfaction with the increase in licensure fees and will continue to monitor the matter. The Executive Committee stated its strong support for Congressman McMillian's proposed legislation to restore Medicare payments for electrocardiogram (EKG) interpretations.

The Council will continue to monitor legislative actions on the podiatry bill issue and is prepared to take whatever steps may be necessary as circumstances develop.

### Report of the Public Health Committee's Ad Hoc Special Committee to Study Radiation Technology and Nuclear Medicine Regulations

Herman C. Maganzini MD, Chairperson of the Public Health Committee, stated that the Ad Hoc Special Committee to Study Radiation Technology and Nuclear Medicine Regulations has been meeting over the summer. It also had has a joint meeting, as required by HB 408, with the BPQA, the Maryland Hospital Association (MHA), and radiologic groups to draw up a position on two matters related to radiology: (1) regulations for mammography centers and (2) a new form of radiologic technician to be called x-ray assistant — this would be a less trained individual so that physicians who do radiology in their office would be able to continue to do it in a somewhat similar way, yet ensure safety of the populace and employees.

Dr. Maganzini mentioned that a forum on these matters was held this morning, at which time the facts were presented. The forum was well-received and there were "lots of questions."

Dr. Maganzini then presented the following two recommendations from the Committee for adoption by Med Chi as their official position on the above-mentioned issues:

The Ad Hoc Special Committee of the Public Health Committee of the Medical and Chirurgical Faculty of Maryland has reviewed the American College of Radiology's standards and the Health Care Financing Administration's standards for mammography screening. The Ad Hoc Special Committee recommends that these standards be adopted as the standards described in House Bill 408, "Mammography Testing, Certification of Medical Radiation Technologists and Nuclear Medical Technologists." The Ad Hoc Special Committee further recommends that no other standards be developed or implemented.

The Ad Hoc Special Committee of the Public Health Committee of the Medical and Chirurgical Faculty of Maryland recommends the adoption of the category, "x-ray assistant." This individual will not be a radiation technologist but rather a medical assistant, part of whose function would be the taking of x-rays in a medical office under the direct supervision of a physician. The Ad Hoc Special Committee recommends that these individuals receive only that training necessary to assure safety to both patients and staff while acting in this limited role under the direct supervision of the physician.

Dr. Maganzini went on to explain the reason for the recommendations and mentioned that none of the 117 mammography centers surveyed had any objections to the mammography screening recommendations.

After much discussion, it was decided to change the word "category" in the second recommendation to "classification."

Also, so there would be flexibility on the part of the Faculty to modify its position somewhat during the legislative process, the House of Delegates decided not to adopt these recommendations as their position, but to accept the report from the committee.

Issue packets on these two subjects were available.

### **Report of the Public Health Committee's Special Ad Hoc Committee to Study Laboratory Regulations**

Carol W. Garvey MD, Chairperson of the Special Ad Hoc Committee to Study Laboratory Regulations, updated the House of Delegates on this issue, stating that since the House's last meeting in May, four meetings have been held with the DHMH's Laboratory Advisory Committee on regulations dealing with office-based laboratories, and there appears that a cooperative relationship has developed. Nineteen of twenty-four sections have been reviewed. There will be more meetings. When the regulations are finalized, the committee hopes to have some educational materials and programs available to physicians.

### **Report of the AIDS Committee**

Dr. Nagel mentioned that the Reference Committee met on August 6 to hold a public hearing on the draft *Practice Protocol for Physicians with HBV/HIV*. He thanked Dr. Kalish, Vice Chairperson of this Committee, for presiding over the meeting. Because of information being received almost daily from the Centers for Disease Control (CDC) and other scientific sources, the Reference Committee did not have a final resolution to present to this body. However, Fred Gill MD, Chairperson of the AIDS Committee, would present that Committee's report.

Dr. Gill discussed the Committee's draft *Protocol for Physicians with HBV/HIB*. Proposed changes resulting from comments made at the panel meeting on AIDS earlier today were handed out at this time. It was moved, seconded, and passed to approve the five recommendations separately.

After much heated discussion as to whether to include hepatitis B in the *Protocol*, the House voted to exclude any mention of hepatitis B in the *Protocol* and in the five recommendations presented today.

It was mentioned that this issue has become politicized and that, unfortunately, we were dealing with hysteria and not scientific fact in trying to come up with a *Protocol*. Dr. Gill strongly advised the House that it would be unacceptable to the AIDS Committee to remove HBV from the draft *Protocol*.

It was made a point of information that the draft *Protocol* was referring to the E Antigen Positive Hepatitis B. Some reasons cited not to include HBV in the *Protocol* were that it did not speak to the mandate of the law; there was no assurance the two diseases will historically follow the same line and the two issues should not be mixed; there is a vaccine for HBV and not for AIDS; and it may give citizens another reason for hysteria.

One reason presented to include HBV in the draft *Protocol* was that exclusion might hurt the medical society because

Med Chi had not followed the CDC's guidelines. In addition, HBV transmission is far more of a problem and health risk than HIV, and by including HBV, Med Chi would merely be saying it is in compliance with CDC's pamphlet, *Prevention of HIV and HBV*.

The changes, as presented, are appended to these minutes. Change #1, deletion of HBV/hepatitis B virus was adopted. Change #2 was accepted with the deletion of HBV and the addition of "wish to" before "...continue to perform" and of "The panel is designed to fulfill the requirements of the Maryland General Assembly's legislation" at the end of the paragraph. Change #3 was approved with the deletion of HBV. Change #4, a deletion, was approved as written. Change #5 was approved with the deletion of HBV.

Timothy Baker MD moved to include a preamble paragraph immediately before the heading "Expert Review Panel" as follows:

Transmission of HIV from physician to patient has never been documented.

The CDC has calculated the risk of any possible future transmission as inconsequential in comparison to real risks of preventable deaths that the public accepts without question (e.g., smoking, failure to use seat belts, easy access to guns, etc.)

The transmission of HIV from patient to physician has been documented.

The public is concerned with the negligible risk of transmission of HIV from physician to patient.

THEREFORE: Med Chi moves to address this concern with the following measures:

The motion to include the above information was seconded and passed by the House.

A motion was made, seconded, and passed that the information under "Advocacy Contract" and "Physician Compliance" be extracted and referred to legal counsel and Faculty Council prior to its re-insertion into the *Protocol*.

The final version of *Practice Protocol for Physicians with the Human Immunodeficiency Virus (HIV)* as accepted by the House of Delegates on September 14, 1991 is included as an official part of the minutes for this meeting.

### **Maryland Foundation for Health Care**

The President noted that the Maryland Foundation for Health Care has requested that Med Chi refrain from nominating members to its Board of Directors at this time due to contemplated downsizing. The House will abide by the request.

### **Report of the Maryland Medical Political Action Committee (MMPAC)**

Chairperson John Lynn MD mentioned why it was important for every physician to belong to MMPAC and made a strong request for those who had not joined to do so. Funding is important to Med Chi's continuation in the political arena. There are many important issues before elected officials and patients need the physician's advocacy.

Albert Blumberg MD made a motion, which was seconded

and passed, that "Med Chi's House of Delegates strongly supports MMPAC membership by all Maryland physicians."

### Adoption of Auditor's Statement

Albert Blumberg MD, Treasurer, asked that the auditors statement for 1990 be adopted as published in the August 1991 *Maryland Medical Journal*. It was accepted. Dr. Blumberg mentioned that although Med Chi received much less from DHMH this year, it is still in sound financial condition.

### Finance Committee Recommendations

Dr. Blumberg presented two motions recommended by the Finance Committee, approved by the Executive Committee, and presented to Council for adoption as follows: (1) To change the name of the Physician Rehabilitation Fund to Membership Services Reserve for accounting purposes and (2) to redesignate the \$10 Physician Rehabilitation line item on the dues billing to Membership Services Reserve. Both motions were accepted.

During the discussion of these motions, a request for a program budget was made so that the membership could see various program cost allocations. Dr. Blumberg stated that he was open to suggestions as to how to present the budget as to what the membership wanted.

### Bylaws Committee Report

Karl Weaver MD, Acting Chairperson to the Bylaws Committee, presented this Committee's report. He noted that there were several interrelated items caused by the need to change the Bylaws, so that any reference to Councilors would be removed from the OFFICER Article and placed under the COUNCIL Article. The reason for this change was due to the Maryland State Ethics Commission which declared that there was a conflict of interest for Med Chi Officers to be considered for the BPQA. The suggested changes to the Bylaws would extract references to "Councilors" as "Officers," allowing their consideration as nominees to the BPQA.

The Bylaws Committee report was presented to the House of Delegates.

- **1. Proposed Bylaw Amendment to Article IV, Section 1**

*Rationale:* Deletes all references to Councilors, transferring this information to Article VII — COUNCIL.

*Amend Article IV, Section 1, as follows — [ ] indicate deletion; CAPS indicate change.*

Section 1. The Elective Officers shall be a President, a President-elect, a First, Second and Third Vice President, a Secretary, AND a Treasurer [and Councilors].

The Bylaws Committee recommended adoption of this proposed amendment. The amendment was adopted by the House of Delegates.

- **2. Proposed Bylaw Amendment to Article IV, Section 3**

*Rationale:* Transfers Section 3 in its entirety to Article VII — COUNCIL, to clarify the fact that Councilors are not

Officers of the organization and should not appear under the OFFICERS Article but rather under the COUNCIL Article.

The Bylaws Committee recommended adoption of this proposed amendment. The amendment was adopted by the House of Delegates.

- **3. Proposed Bylaw Amendment to Article IV, Section 4**

*Rationale:* Deletes all references to Councilors, transferring this information to Article VII — COUNCIL.

*Amend Article IV, Section 4, as follows — [ ] indicate deletion; CAPS indicate change.*

Section 4. The Nominating Committee shall nominate candidates for each elective office to be filled, except President [and Councilors which]. THESE nominations shall be mailed to every member of the House of Delegates at least ten days before its annual session. The Chairperson of the Nominating Committee shall, between January 1 and January 15 each year, request each component society to submit to it, not less than forty-five days before the annual session, suggested nominees for the positions to be nominated by the Committee together with such background data as will assist the Committee in selecting the most qualified persons. No member may be nominated without his consent. Vice Presidents, to hold that office, shall be members of component societies which are in different Nominating Committee groups. Additional nominations may be made from the floor at the first meeting of the session and voting shall be limited to the nominees

The Bylaws Committee recommended adoption of this proposed amendment. The amendment was adopted by the House of Delegates.

- **4. Proposed Bylaw Amendment to Article IV, Section 6**

*Rationale:* Deletes all references to Councilors, transferring this information to Article VII, and amends the current Bylaws which now require a delay of one year before certain elective officers assume the position to which elected. (Should this Bylaw amendment be adopted by the House of Delegates, it shall not take effect until the conclusion of the 1993 annual session. Also, the Nominating Committee for 1992 will not consider nominees for the three Vice Presidents, Secretary, and Treasurer — these positions being filled by action of the 1991 Nominating Committee.)

*Amend Article IV, Section 6, as follows — [ ] indicate deletion, CAPS indicate change.*

Section 6. Elective officers [except Councilors] shall hold office for a term of one year or until their successors are elected. [Councilors shall hold office for a term of three years, with the exception of the representative of the Committee on Specialty Societies who shall serve for a term of one year, or until their successors are elected, provided that they may not serve more than two consecutive terms.] Elective officers [, except Councilors,] shall assume their duties at the close of the annual session AT WHICH THEY ARE ELECTED. [one year after their election, except that the] THE President-elect shall ALSO assume [that office at the close of the annual session at which he is elected. Councilors in each newly elected annual class shall assume their duties at the close of the annual session immediately

preceding which they were elected.] THE DUTIES OF THE PRESIDENT IMMEDIATELY AT THE CONCLUSION OF THE ANNUAL SESSION.

The Bylaws Committee recommended adoption of this proposed amendment. A motion was made, seconded and passed to substitute "when president's term expires" for "...At the close of the annual session." The amendment with the approved change was adopted by the House of Delegates.

## • 5. Proposed Bylaw Amendment to Article IV, Section 9

*Rationale:* Deletes all references to Councilors from Article IV, transferring it to Article VII.

*Amend Article IV, Section 9, as follows — [ ] indicate deletion; CAPS indicate change.*

Section 9. Vacancy in the office of President shall be filled by the President-elect. Vacancy in any other office elected by the House of Delegates shall be filled by the Council until the next annual session of the House of Delegates. [In the event of a vacancy in the office of Councilor, the Secretary shall notify the appropriate component society which shall fill the vacancy within sixty days of notification. If the component society fails to fill the vacancy within the time provided, the Council may elect a member of that component society to fill the vacancy.]

The Bylaws Committee recommended adoption of this proposed amendment. The amendment was adopted by the House of Delegates.

## • 6. Proposed Bylaw Amendment to Article VI, Section 4

*Rationale:* Deletes the requirement for one-third (thirty-member) endorsement of individual member resolutions so as to stimulate the submission of resolutions to the House of Delegates.

*Amend Article VI, Section 4, as follows — [ ] indicate deletion; CAPS indicate change.*

Section 4. All resolutions involving questions of Faculty policy which will be presented to the House of Delegates for action, shall be filed with the Executive Director and sent to all delegates with the call for the session, provided that by a two-thirds vote the House of Delegates may agree to consider any policy resolution without prior notice. No such resolution shall be accepted by the Executive Director which is not sponsored by a member or component society of the Faculty, the Council, or committees of the Faculty [provided, however, that a resolution introduced by an individual member must have the endorsement of either one-third of the membership of his component society or thirty members of his component society, whichever is smaller].

The Bylaws Committee recommended adoption of this proposed amendment. A motion was made, seconded, and passed to amend the report by substituting "five members" for "member." ("No such resolution shall be accepted by the executive director which is not sponsored by **five members**...") The amendment with the approved change was adopted by the House of Delegates.

## • 7. Proposed Bylaw Amendment to Article VII, Section 1

*Rationale:* Clarifies that the representatives of component societies are their Councilors.

*Amend Article VII, Section 1, as follows — [ ] indicate deletion; CAPS indicate change.*

Section 1. The Council shall be composed of the elective officers of the Faculty, the immediate past president, the Delegates to the American Medical Association, the deans of medical schools within Maryland, COUNCILOR representatives of component medical societies, and a representative of the Committee on Specialty Societies who shall serve for a term of one year.

The Bylaws Committee recommended adoption of this proposed amendment. The amendment was adopted by the House of Delegates.

## • 8. Proposed Bylaw Amendment to Article VII, Section 9

*Rationale:* Completes the paragraph transferred from Article IV to Article VII.

*Amend Article VII, Section 9, as follows — [ ] indicate deletion; CAPS indicate change.*

SECTION 9. ONE-THIRD OF THE COUNCILORS SHALL BE [elected] SELECTED ANNUALLY BY THE COMPONENT SOCIETIES FROM AMONG THEIR ACTIVE AND FORTY-YEAR MEMBERS WHO HAVE HAD SOME PREVIOUS ACTIVE SERVICE AT THE COMPONENT OR FACULTY LEVEL. EACH COMPONENT SOCIETY SHALL BE REPRESENTED BY ONE COUNCILOR FOR THE FIRST 200 ACTIVE OR FORTY-YEAR MEMBERS OR LESS AND ONE ADDITIONAL COUNCILOR FOR EACH ADDITIONAL 200 ACTIVE OR FORTY YEAR MEMBERS OR FRACTION THEREOF AS DETERMINED ANNUALLY ON DECEMBER 31 PROVIDED, HOWEVER, THAT ANY COMPONENT SOCIETY COMPOSED EXCLUSIVELY OF STUDENT MEMBERS OR ACTIVE MEMBERS WHO ARE ON THE RESIDENT STAFF OF HOSPITALS OR HOLDING A FELLOWSHIP SHALL BE REPRESENTED BY ONE COUNCILOR. [component societies which are to elect Councilors shall do so by majority vote in a membership election.] THE RESULTS OF THAT [election] SELECTION PROCESS BY EACH COMPONENT SOCIETY SHALL BE REPORTED TO THE FACULTY AT LEAST THIRTY DAYS BEFORE THE FACULTY'S ANNUAL SESSION.

The Bylaws Committee recommended adoption of this proposed amendment. It was moved, seconded, and adopted to change the word "of" to "at" after "...previous active service..." The amendment with the approved change was adopted by the House of Delegates.

## • 9. Proposed Bylaw Amendment to Article VII, Section 10

*Rationale:* Deletes paragraph from Article IV and transfers it to Article VII.

*Amend Article VII, Section 10, as follows — [ ] indicate deletion; CAPS indicate change.*

SECTION 10. COUNCILORS SHALL HOLD OFFICE FOR A TERM OF THREE YEARS, WITH THE EXCEPTION OF THE REPRESENTATIVE OF THE COMMITTEE ON

SPECIALTY SOCIETIES WHO SHALL SERVE FOR A TERM OF ONE YEAR, OR UNTIL THEIR SUCCESSORS ARE [elected] SELECTED, PROVIDED THAT THEY MAY NOT SERVE MORE THAN TWO CONSECUTIVE TERMS. COUNCILORS IN EACH NEWLY SELECTED ANNUAL CLASS SHALL ASSUME THEIR DUTIES AT THE CLOSE OF THE ANNUAL SESSION IMMEDIATELY [preceding which they were selected] FOLLOWING THEIR SELECTION.

The Bylaws Committee recommended adoption of this proposed amendment. The amendment was adopted by the House of Delegates.

- **10. Proposed Bylaw Amendment to Article VII, Section 11**  
*Rationale:* Deletes from paragraph Article IV and transfers it to Article VII.

*Amend Article VII, Section 11, as follows — [ ] indicate deletion, CAPS indicate change.*

SECTION 11. VACANCY. IN THE EVENT OF A COUNCILOR VACANCY, THE SECRETARY SHALL NOTIFY THE APPROPRIATE COMPONENT SOCIETY WHICH SHALL FILL THE VACANCY WITHIN SIXTY DAYS OF NOTIFICATION. IF THE COMPONENT SOCIETY FAILS TO FILL THE VACANCY WITHIN THE TIME PROVIDED, THE COUNCIL MAY [elect] SELECT A MEMBER OF THAT COMPONENT SOCIETY TO FILL THE VACANCY.

The Bylaws Committee recommended adoption of this proposed amendment. The amendment was adopted by the House of Delegates.

- **11. Proposed Bylaw Amendment to Article IX, Section 2**  
*Rationale:* Deletes the term "at least" on lines 13 and 14 for clarification, so that the requirement will be an exact number.

*Amend Article IX, Section 2, as follows — [ ] indicate deletion, CAPS indicate change.*

Section 2. Replacement members of the Board of Physician Quality Assurance to be seated each year shall be presented at the first meeting of the annual session of the House of Delegates and [at least] twice the number of vacancies to be filled for that specific year shall be voted upon as the list of nominees to be submitted to the Governor for appointment to the Board. Vacancies on the Board caused by death, resignation, or removal from office, shall be filled in accordance with the current Bylaws.

The Bylaws Committee recommended adoption of this proposed amendment. The amendment was adopted by the House of Delegates.

- **12. Proposed Bylaw Amendment to Article XI, Section 8**  
*Rationale:* Increases Editorial Board membership from six to at least eight.

*Amend Article XI, Section 8, as follows — [ ] indicates deletion, CAPS indicate change.*

Section 8. There shall be an Editorial Board of the *Maryland Medical Journal* [composed] COMPRISED of the Editor[,] AND AT LEAST EIGHT BOARD MEMBERS. [appointed by the] The Council SHALL APPOINT THE EDITOR for a three-year term or until a successor is appointed.[; an] THE PRESIDENT SHALL APPOINT ONE OF THE BOARD

MEMBERS AS Associate Editor [designated by the President from the Board members] for a three-year term or until a successor is appointed. [; and six members, two of whom shall be appointed by the President each year for a three-year term.] EACH YEAR, THE PRESIDENT SHALL APPOINT OR RE-APPOINT BOARD MEMBERS FOR THREE-YEAR TERMS AS NECESSARY. THE PRESIDENT SHALL ALSO APPOINT MEMBERS TO COMPLETE UNEXPIRED TERMS. The Board shall review and accept papers for publication in the *Maryland Medical Journal* in accordance with the objectives as approved by Council. The Board shall periodically review its goals/purposes of publication for Council re-review and approval, and shall SO report to the Council [at appropriate intervals].

The Bylaws Committee recommended adoption of this proposed amendment. The amendment was adopted by the House of Delegates.

- **13. Proposed Bylaw Amendment to Article XI, Section 21**  
*Rationale:* Changes "elect" to "select" and deletes references to councilors.

*Amend Article XI, Section 21, as follows — [ ] indicate deletion, CAPS indicate change.*

Section 21. A Nominating Committee of nine members, of which the Immediate Past President shall be Chairman, shall be appointed by the President as follows: each component society shall [elect] SELECT one nominee for the committee and the President shall select from these nominees one member of the committee from those submitted by the component societies in each of the following groups: (a) Allegany, Carroll, Frederick, Garrett, and Washington Counties; (b) Caroline, Cecil, Dorchester, Harford, Kent, Queen Anne's, Somerset, Talbot, Wicomico and Worcester Counties; (c) Baltimore City; (d) Baltimore County; (e) Anne Arundel, Calvert, Charles, Howard and St. Mary's Counties; (f) Montgomery County; and (g) Prince George's County. He shall also select a member-at-large. It shall nominate candidates as provided in these Bylaws for elective officers [except Councilors], elected committees, the Board of Physician Quality Assurance, and delegates and alternates to the American Medical Association. No member except the Immediate Past President may serve more often than once in each five years.

The Bylaws Committee recommended adoption of this proposed amendment. The amendment was adopted by the House of Delegates.

- **14. Proposed Bylaw Amendment to Article XI, Section 28**  
*Rationale:* Includes a description of a function currently performed by the Ethics Committee — the approval of corporate names by professional medical associations.

*Amend Article XI, Section 28, as follows — [ ] indicate deletion, CAPS indicate change.*

Section 28. A Committee on Professional Ethics composed of at least nine members appointed by the President shall render, and publish if warranted, written opinions on the proper interpretation of the "Principles of Medical Ethics," either on its own initiative or upon the request of any person, organization, physician or patient as they relate to social

policy issues, interprofessional relations, hospital relations, confidentiality, advertising, communications relations with the media, fees and charges, record practice matters and professional rights and responsibilities. THE COMMITTEE SHALL CONSIDER ALL PROPOSALS FOR THE USE OF CORPORATE NAMES BY PROFESSIONAL MEDICAL ASSOCIATIONS AND SHALL APPROVE THOSE NAMES THAT CONFORM WITH THE REQUIREMENTS OF THE LAW, RULES, REGULATIONS AND ESTABLISHED ETHICAL STANDARDS OF THE MEDICAL PROFESSION. The Chairman shall be appointed by the President from among the members.

The Bylaws Committee recommended adoption of this proposed amendment. The amendment was adopted by the House of Delegates.

- **15. Proposed Bylaw Amendment to Article XI, Section 31**  
*Rationale:* Includes selection of membership by component societies from component public relations activities.  
*Amend Article XI, Section 31, as follows — [ ] indicate deletion, CAPS indicate change.*

Section 31. A Public Relations Committee of at least five members shall undertake to enhance the image of physicians; supply speakers to organizations requesting them on subjects relating to the practice of medicine; undertake such methods as it deems advisable to inform and instruct the public generally on subjects related to the practice of medicine; issue to the press and other media of public information releases relating to the meetings, actions and activities of the Faculty, with the advice and approval of the President or Executive Director, and serve in an advisory capacity to the Auxiliary. Its Chairman and members shall be appointed by the President WHO SHALL ALSO APPOINT A REPRESENTATIVE DESIGNATED BY ANY COMPONENT SOCIETY. The Maryland State Dental Association shall have the right to [elect] SELECT one associate member of the committee with voice but without vote.

The Bylaws Committee recommended adoption of this proposed amendment. A motion was made, seconded and adopted to change the word "any" to "each" ("...who shall also appoint a representative designated by each component society..."). The amendment with the approved change was adopted by the House of Delegates.

### Review of Resolutions

Carol W. Garvey MD, Secretary, presented the following resolutions to be reviewed in accordance with the House of Delegates resolution of April 21, 1983 that requires that a review of all policy decisions be conducted ten years after their adoption; this resolution was revised at the House of Delegates meeting of September 24, 1988, requiring the review of resolutions five years after adoption:

Suggested actions are to REAFFIRM, FILE, or DELETE.

**Resolution 4A/86(a): RESOLVED**, That the Medical and Chirurgical Faculty of the State of Maryland hereby recognizes the reoccurrence of the unavailability of professional liability for physicians in this State, and be it further,

**Action:** File, No Action

**4A/86(b): RESOLVED**, That the Medical and Chirurgical Faculty shall investigate the circumstances surrounding this action by the Medical Mutual Liability Insurance Society of Maryland and shall take whatever steps are possible and necessary in order to assure the availability of professional liability insurance to any physician who is duly licensed for the practice of medicine and surgery in the State of Maryland.

**Action:** File, No Action

**Resolution 1S/86(a): RESOLVED**, That the Medical and Chirurgical Faculty of the State of Maryland become a member of and participate in a membership organization to inquire into and respond to the proposal by the Department of Defense to restructure the CHAMPUS Program, and other issues of common interest, and

**Action:** Delete

**1S/86(b): RESOLVED**, That the Medical and Chirurgical Faculty begin an investigation into the feasibility of creating a statewide organization or network of physician IPAs capable of entering into contracts for the provision of health care on behalf of its physician members, and

**Action:** Delete

**1S/86(c): RESOLVED**, That the Council shall have the authority to authorize expenditure of funds and the creation of such an organization should the investigation indicate that such an organization should be formed.

**Action:** Delete

**Resolution 2S/86: RESOLVED**, That this House expresses its heartfelt appreciation to Ms. Elza Davis for a job well done and expresses its hope that her wise counsel will continue to be available to the physicians of Maryland for many years to come.

**Action:** File, No Action

### Report of the Liaison Committee to the Medical Assistance Program

Gary Rosenberg MD, Chairperson to the Liaison Committee to the Medical Assistance Program, briefly reviewed the Maryland Access to Care (MAC) Program and the Medicaid Provider Fee Project since everyone had already received information packets on these programs.

Dr. Rosenberg said that all counties, except Dorchester, had met the requirements of the MAC program, and that the program is going well.

Regarding the Medicaid Provider Fee Project, Dr. Rosenberg stated that there is a proposal from DHMH to allow physicians to charge and receive all of their usual fee, then pay back the "Provider Fee" or do as they do now and have the "provider fee project" amount withheld so they don't have to pay it back. DHMH felt that such a system of repayment would meet HCFA's requirements. The Faculty is continuing to work with DHMH to clarify the issue of the 1099.

Nelson Sabatini answered questions on the Provider Fee Project. He stated that it was DHMH's intent that "it was being used the way it was being used" and if physicians wished to change it, they must do so through legislation. Mr. Sabatini did not feel legislation would be introduced to change the way the program was working. He referred to Congressman Waxter's letter to Gail Wilensky of HCFA, in which Congressman Waxter stated that "if you do not like it, you may not agree with it, but that [what Maryland is doing] is what we intended to do." He reiterated that Maryland would prevail on this issue. He explained how Medicaid rolls were up and states have to find a way to pay the increase.

### Wicomico County Resolution

Dr. Azar stated that because of the continuing work being done by Med Chi to resolve the Provider Fee Project issue, the Wicomico County Medical Society has decided to withdraw its resolution regarding this matter.

## Practice Protocol for Physicians with the Human Immunodeficiency Virus (HIV)

### Adendum to the House of Delegates Minutes (Adopted September 14, 1991)

The Medical and Chirurgical Faculty of Maryland, in consultation with the Centers for Disease Control, the Maryland Hospital Association, and the Department of Health and Mental Hygiene, shall develop a practice protocol for physicians who are infected with HIV. (HB 124)

The Maryland Practice Protocol for Physicians with the Human Immunodeficiency Virus (HIV) complies with the Centers for Disease Control (CDC) "Recommendations for Preventing Transmission of Human Immunodeficiency Virus...to Patients During Exposure-Prone Invasive Procedures," as published in the *Morbidity and Mortality Weekly Report (MMWR)* on July 12, 1991. This includes adherence to universal precautions and infection control practices. This protocol is intended to be applied to physicians only, although it may be applicable to other health care groups.

The Medical and Chirurgical Faculty of Maryland (Med Chi) requests the Maryland General Assembly to consider the following facts when developing any legislation relating to physicians infected with HIV:

1. Transmission of HIV from physician to patient has never been documented.
2. The CDC has calculated the risk of any possible future transmission as inconsequential in comparison to real risks of preventable death that the public accepts without question (e.g., smoking, failure to use seat belts, easy access to guns, etc.).
3. The transmission of HIV from patients to physicians has been documented.

Despite these facts, the public is concerned with the negligible risk of transmission of HIV from physician to patient.

### Committee Reports

The President noted that several committee reports containing no recommendations or resolutions for action at this time appeared in the August 1991 *Maryland Medical Journal*. It was noted that any recommendations contained in those reports were acted upon at the 1991 annual session.

### Other Business

Dr. Mintzer asked who authorized the raised dues. It was noted by the President that the membership dues had not been raised and what Dr. Mintzer was referring to was the physician licensure renewal fee, which was raised by the BPQA.

Dr. Hooper made a motion that whenever an AMA Delegate position is vacated, it be filled whenever possible by an Alternate Delegate. After some discussion, this motion was not carried.

### Adjournment

There being no further business, the meeting was adjourned *sine die* at 5 pm.

To address this concern, Med Chi offers the following practice protocol for physicians with HIV:

### Expert Review Panel

Physicians infected with HIV who perform exposure-prone procedures must be evaluated to determine whether they should modify their professional activities to reduce the risk of transmission of HIV to patients. Physicians who test positive for HIV and wish to continue performing exposure-prone procedures shall seek counsel from an expert review panel or refrain from performing those procedures. The panel is designed to fulfill the requirements of the Maryland General Assembly's legislation.

Every physician case will be referred to a review panel appointed by Med Chi which consists of two components: a core group and two additional members. The core group is comprised of:

- a physician specialist in infectious disease, knowledgeable in HIV issues, appointed by Med Chi, who shall be chairperson of the review panel;
- a physician representing the state health department, appointed by the Secretary to the Department of Health and Mental Hygiene (DHMH); and
- a physician representative from the Maryland Hospital Association (MHA).

These representatives will be assigned to the panel by Med Chi for a designated period of three years to provide continuity in the panel's decisions and may be reappointed. The two other panel members selected by the core group will be unique to each case and will consist of:

- the infected physician's personal physician or other physician designated by the infected physician; and

- a physician with expertise in the same specialty as the infected physician.

The panel shall evaluate the potential risk of transmission of HIV from the infected physician to patients and, where appropriate, limit the infected physician from performing certain exposure-prone procedures or require the infected physician to obtain informed consent from patients prior to performing certain exposure-prone procedures.

The panel is to be staffed by Med Chi and its records are to be kept at Med Chi. The records of the panel are confidential, not-discoverable, and cannot be used in any civil action. Information regarding a case can be revealed to the Board of Physician Quality Assurance (BPQA) if the physician does not abide by the stipulations of the advocacy contract.

### Advocacy Contract

This section was extracted to refer to legal counsel and the Faculty Council:

Upon completion of the evaluation, the infected physician will sign an advocacy contract stipulating what is expected of him or her. Contracts will be tailored to the individual needs of the physician and will include a provision for quarterly monitoring of the infected physician by members of the expert review panel. During the quarterly monitoring, the panel will review, revise and/or update the infected physician's advocacy contract based on new information.

### Monitoring

Inside hospitals, each infected physician with procedure limitations imposed by the panel will be monitored confidentially by the review panel through a Health Services Cost Review Commission (HSCRC) database that creates an abstract for each hospital admission. In this database, physicians are assigned a unique identification number which can only be linked to the identity of the physician by Med Chi. This monitoring system will assure that the confidentiality of the infected physician is maintained.

Infected physicians who perform invasive procedures outside hospitals (e.g., surgicenters) will be subject to quarterly reviews of their patients' medical records by a member of the review panel.

### Physician Compliance

This section was extracted to refer to legal counsel and the Faculty Council:

HIV-infected physicians who knowingly perform exposure-prone procedures and do not voluntarily restrict themselves or seek advice from the panel will be subject to action by the BPQA. HIV-infected physicians who violate the terms of their advocacy contract will also be subject to action by the BPQA. The review panel shall be required to report violations of advocacy contracts to the BPQA.

Provisions for professional and/or financial/insurance assistance must be made to help physicians who modify their practice patterns as a result of their HIV status.

### Liability

An effective review of the infected physician can only take place if the members of the expert review panel can feel free to express their opinions without fear of litigation. Immunizing panel members from suit must be an integral part of any legislation concerning this protocol.

### Confidentiality

It is mandatory that great care be provided to ensure the confidentiality of any physician who voluntarily seeks the advice of the panel. Knowledge of the physician's HIV status shall be restricted to the members of the expert panel unless the physician does not abide by the advocacy contract, in which case the physician will be reported to the BPQA.

### Testing

Physicians who perform exposure-prone procedures have a professional responsibility to know their own HIV status. Physicians who perform exposure-prone procedures or who have reasonable cause to believe they may be infected should determine their serostatus and, if positive, voluntarily refrain from performing exposure-prone procedures or seek the advice of the expert review panel. Mandatory testing of physicians or health care workers is not recommended.

### Definitions

**HIV-positive Physician** - A physician who has a positive ELISA (enzyme-linked immunoabsorbent assay) test with a confirmatory Western Blot.

**Exposure-prone Invasive Procedures** - The present CDC draft guidelines attempt to provide a clear distinction between invasive procedures from which there is little or no risk of transmission of HIV and those exposure-prone invasive procedures which may pose a significant risk of transmission of HIV. Exposure-prone invasive procedures are defined as those that present a recognized risk where the physician's blood is likely to contact the patient's body cavities, subcutaneous tissues, and/or mucous membranes. Contact can occur directly, as a result of overt bleeding by the physician following a percutaneous injury from a needle or other sharp instrument, or through injuries caused by bone, bone fragments, or implanted and fixed surgical devices. Contact can also occur indirectly, through contamination of instruments or materials used during the procedure.

Exposure-prone procedures include those that involve the digital palpation of a needle tip in a body cavity. Other potentially high-risk procedures are those that require the simultaneous presence of the physician's fingers and a sharp instrument or needle in a poorly visualized or highly confined anatomic site.

The Med Chi Committee on AIDS is currently surveying its specialty societies and will attach to this protocol a listing of procedures it considers to be high-risk for transmission of HIV. ■

## Are Your Offices In Need Of Major Surgery?

Chaotic traffic patterns, inadequate waiting areas, abrasive color schemes, a lack of integration of special equipment—all symptoms of a poorly designed medical suite. Symptoms that can increase the stress on your entire staff, cost you time, money and even your patients.

This is why many healthcare professionals seek the services of Levin/Brown. As one of the region's leading architects and interior designers of medical suites, surgery and ambulatory care facilities, laboratories, and medical office buildings, we can show you how to make your offices a far more productive place to practice medicine.

(301) 539-0872 or (800) 492-1056 in MD.  
For hotel reservations call (301) 752-1100

# A MEDICAL TEST SHOULD **NOT** SCARE PEOPLE HALF TO DEATH!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS<sup>TM</sup> MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 400 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At the Greater Baltimore MRI Center, Inc., we make it easier for you to diagnose your patients' problems.

**ACCESSIBLE MRI of  
BALTIMORE COUNTY, INC.**

110 West Road  
Suite 212  
Towson, MD 21204  
**(301) 825-4MRI**

*Magnetic Resonance Imaging without claustrophobia or noise associated with other systems*

# Competition, HMOs, Insurance and slow-paying patients... it's enough to make you sick.

THE PROBLEMS

# Why buy an office automation system that doesn't offer a long-term solution?

## ACCLAIM™ from Sentient is the total system solution.

A lot of medical practices are planning to invest in an office automation system. But a lot of the systems out there just don't offer the comprehensive functions and long-term expandability that your practice may need.

### **IBM® and compatible hardware.**

The ACCLAIM system operates on IBM and compatible hardware, so you know you're getting the quality standard of the industry. And it's completely expandable, so it can grow as your practice grows.

### **Long-term support.**

ACCLAIM is the system solution that fits your needs today. And Sentient's software engineers, customer trainers, and telephone support people

are always there to make sure your system fits your needs over the years to come.

### **Easy to operate.**

Even if your staff has no previous computer experience, ACCLAIM is simple to operate effectively and efficiently. Complete training is included in the purchase.

When you're thinking about office automation, call Sentient first, and find out what ACCLAIM can do for you.

**1-800-247-9419**  
(In the D.C. Metro area  
call 1-301-929-7600.)
